Due to the adoption of new technology in the form of hand operated press machine production of tiles which used to be performed by using simple technology is now performed using press machine However the adoption of this new technology is not yet complete There are some producers who still produce tiles using the traditional technology This situation has led to the differentiation of tile producing households Four categories of tile producing households can be described as follows

Firstly, households headed by women In this type of households, the woman is also the sole entrepreneur This woman usually works with the help of the children and one or two female paid labourers The tasks of the female workers include all stages of traditional tiles production Only for certain tasks such as baking the tiles, a male labour is hired Since the woman is also the entrepreneur, all decisions concerning the pro duction and the marketing are taken solel by her The profits gained from this produc tion go to them They decide and control th use of their earnings In this sense, th woman is very independent However, th returns obtained from this activity is ver meagre as they only produce on a sma scale Thus their independence here is con strained by the limited access to strategi resources i e capital

The second category of households ar those which see tile making as the secondar source of income In this type of househol the husband who is considered as the head o household works outside on all kinds o work but tile making while the wife produc es tiles This kind of division is a househol strategy for facing the shortfall in incom from one source and avoiding risks

The interviews revealed that even thoug tile making is considered as the secondar source of income in fact many household rely on this source of income for their sur vival since the income gained from th source is quite reliable (despite the season for most households they produce tiles a the year round Of course during the we season the production is less than the dr season This is due to the lower availabilit of the space and the lack of sunshine fo drying tiles) Since only the woman is in volved in tile making it can be predicte that this household produces traditional tile None of these households interviewed pr duced press tiles Like the households head ed by women in this household the woma has a big authority to decide matters co cerning tiles from deciding the quantity tiles produced to marketing and negotiatin the price of tiles with the buyers The hu band s involvement in this business is lim ited to baking the tiles or even less sin many of them use hired male labour to do

Thirdly households produce press tiles well as traditional tiles A very comm phenomenon in this type of households that the man or the husband produces pre tiles using the hand operated press machi with the help of some paid male labo whereas the wife produces the traditio tiles with the help of their children a female paid labour

Production of these two types of tiles not separated completely in the sense labour using Sometimes if the demand press tiles is high and they have to meet deadline, the husband often uses the fem labour from traditional site to help in press tiles production but it is never reverse The female labour involvement press tiles production is limited to prepar the clay to become sheet clay before be printed by using the press machine mending the cracked tiles In some ca there are women who operate the pr machine but this very rarely happens Fr

the interviews the women themselves say that it is hard and heavy for them to operate the machine It needs a 'strong person to do it From two of the men interviewed they said that operating the press machine is not proper (mboten pantes) for women This is in accordance with the general view on women which sees women as weak, not suitable for dealing with technology

Usually both types of tiles are baked together using the same kiln The interviews revealed that in this kind of joint production the head of the household who is the husband takes all decisions not only concerning press tiles production but also the traditional one The husband decides the quantity of clay and wood bought negotiates the price of the material with the sellers as well as negotiates the price of tiles with the buyers and also arranges the transportation

The last category of households are those which mainly produce press tiles In these households the woman (wife) is used as unpaid family labour Their tasks vary from cooking food for the workers to helping in production such as drying and scraping As in the third category of households all decisions concerning the production market ing, paying the workers are taken by the husband What needs to be noted here is that the use of female labour in the press tile production is very limited Usually their tasks only comprise mending the cracked tiles and scraping the tiles

Compared to the use of female labour in the traditional production in which the women are involved in all stages of production, their task here is very specialised Their skill has been reduced This is what some writers say as deskilling' due to mechanisation Rarely have households producing press tile use female labour or if there are any, the number is very small compared to the use of male labour

As has been briefly indicated above patterns of decision making in the household concerning materials for production depends on the type of households For the first two categories, decisions about the use and allocation of resources for production are in the hands of the women In the other two categories of households, women do not have a say in deciding matters concerning the production In this sense, it can be said that the use of new technology (hand press machine) to some extent has limited women's access over control of resources and production In press tiles producing households a woman does not have control even over her own tiles production let alone over her husband's

Class and Gender

The type of households as well as the kinds of women's involvement in tiles production have a considerable bearing on the degree of authority they have in the family In households where the women work as the sole entrepreneurs, the women enjoy a greater authority compared to their counterparts in other category of households However, the degree of authority they have is limited because of the meagre income they get

For female entrepreneurs who come from the second type of households in which they produce tiles while their husbands work outside their authority is only as far as the use of family income Usually in this type of households the husband gives his earnings to the wife to be managed The money the wife gets from her husband together with her own income are used to run the family This joint income is just enough to run the family from day-to day If there is some money left the wife saves it for unexpected events In this sense, it appears as if the wife has control over the family income However, if the family goes through a crisis such as a sudden sickness for instance, it is always the wife who has to face it Therefore, the woman has to manage the income in such a way so that when something unexpected happens she is ready to handle it This kind of handing over the income is in fact the male's strategy to avoid responsibility in the family As long as the man gives his earnings to his wife (even if it is not enough), then he is free from the responsibility of running the family This is confirmed by the interviews

Ibu Subini is 30 years old, married and has three children Her husband works as a coolie in the neighbouring village Everyday after finishing washing, cooking and preparing the children for school, she goes to her mother s house located in a different village and makes tiles in the backside of her mother s house When asked about how she manages to run the family with regard to the earnings both she and her husband get, this is her explanation "My husband always gives his income to me It looks as if we are dumped with money, but if we are not clever enough we will be suffering We have to save for unexpected events, and clever enough to allocate which should go where (ngecak ngecak ake) Yes we get all the money but if there is a need big or small, we have to be able to manage it My husband is never involved in it If there is a big necessity, we are the one helter-skelter (pontang panting) "

Different from the above two categories of households, in households which produce press tiles, the family is better off in an economic sense The financial situation of the family is quite good as most of them possess a hand press machine At least every household which produces press tiles has one machine of its own The capital needed to buy one hand press machine is quite big It ranges from Rp 750,000 to Rp 1,000,000 ($ 1 = Rp 2,000). The installation cost requires in average Rp 250 000. Together they comprise between Rp 1,000,000 and Rp 1,250,000 Many of them financed the machine by partly using their own capital and partly financed from the local NGO Some others got credits from the bengkel owners The interviews with the women from these categories revealed that their family income situation is improving compared to before producing press tiles "Well at least we do not face the shortage of income now The profits we get from producing press tiles are quite good our financial situation is steady We save money to the bank every month It is not a large amount though" That was what Ibu Suyanti (30 years) the wife of Pak Suparno (a press tile producer) said about their family's economic situation

When it comes to education of their children parents (mostly the father) negotiate with their children about which school they should attend The woman (the mother) will be asked for her opinion but the final say is always that of the husband Bapak and Ibu Marjuki produce press tiles They have two children, the eldest, a girl is 15 and the youngest a boy is 11 The eldest quit from school before she finished the first grade of secondary school The reason was that she got headaches (mumet-mumet) when studying When Ibu Marjuki was asked about who decided that the girl should stop from school this is her answer "Bapak (=father) who decided that 'genduk' (a call for a young girl) had to quit" said Ibu Marjuki "You'd better stop from school since you have headaches all the time" said Ibu Marjuki repeating what her husband told the daughter 'I was also consulted"

Concerning the work load there are two different views on it The women who come from households which have stopped producing the traditional tiles and are now working as family labour in press tile making said that their work load now is lighter than before Ibu Ngatmi is the wife of Pak Bandi (42 years), a press tile producer They started to make press tiles three years ago Before they made traditional tiles This is her answer when she was asked about her work load now "Producing press tiles is more convenient than traditional ones Here, the work can be combined with other work tending children . cooking well when you make traditional tiles, you have to work on and on You can't stop Working in traditional tile production is heavier"

These women are no longer involved in printing the tiles since the press machine is considered to be heavy and to be men's work Their tasks are now to prepare food for the workers, to help mend the cracked tiles and to do the finishing touches before the tiles are baked They no longer have to do the printing by stamping the clay which they used to do when making traditional tiles. Stamping the feet on the clay until the

tiles are ready to be printed is considered to be the hardest work in making tiles, and nobody will deny it. Yet when the hand press machine took over and now instead of stamping one needs to use her hands, it is said that this task is heavy. Is not stamping as heavy as pressing the machine using hands? The role of ideology and normative depiction in this matter is very significant. The appropriation of roles based on gender identity about what women should and should not do, to a great extent, affect the way both women and men view technology – in this case the hand press machine.

Quite a different view comes from women who kept on producing traditional tiles, they said that their workload was the same after or before producing press tiles. This is easily explained since whether or not their household produces press tiles their working load will remain the same since they are not involved in press tiles making unless their household stops producing the traditional tiles.

Thus, even from the work load it can be seen that the adoption of hand press machine has resulted in different influences to the women's work load depending on their kind of involvement in the production as well as the category of household they are in. For some women the change of tiles production from traditional to press has reduced some of their burden. Yet for other category of women it does not bring any reduction whatsoever.

Can Gender Relations be Made More Equitable?

The technological innovation in tile production does not displace women in the sense of making them loose all employment opportunities like what usually happened when a new technology is introduced, rather it relegates women to manual, arduous type of production. They are confined in production using simple yet laborious technology whereas the men leap one step forward to get a more advanced technology. If this situation is not changed or if there is no effort to change then the women will be more and more left behind by the men. Efforts to change can be from within meaning from the women themselves or from outside forces. The government project planners and local NGOs can play a big part in making the position of women *vis-a-vis* technology more equal to men.

In the case of adoption of the press tile technology some classical mistakes have been made with regard to the role of women in traditional press tile production. The crucial factor for adoption of the press machine was getting access to information on how to operate this more productive technology. Right from the very beginning, only male producers were given the facility to have access to the hand press technology. The trip to visit clusters of press production organised by the village head (pak Lurah) and sponsored by the Faculty of Economics was only directed to them. This male bias in the adoption process is similar to what has happened in the adoption of new technology in agriculture, which has been discussed in the previous chapters. It seems that once there is a bias towards male producers it will be reinforced by further developments. Ideology and social relations for instance are all geared to the exclusive acceptance of new technology for men.

Credits and loans, another example, were given to the men in the households. The ideology of man the breadwinner and woman the maintainer operates in it. It was assumed that the men are the providers and the women are responsible for the home, therefore the men got all the facilities.

It is easy to pinpoint factors which caused the adoption of new technology in press production to be unfavourable for women compared with men. An important question that needs to be addressed is how to eliminate the negative factors and enhance the positive factors. In other words what can be done to make gender relations more equitable while retaining the positive impact of the new technology, i e higher productivity and higher incomes.

In the first place it is important to note that one cannot expect abrupt changes in the tile industry in Karanggeneng which will lead to more equitable gender relations. However it is still possible to do something at the Karanggeneng micro context.

VII
Conclusion

The impact of technological innovations on people is always mediated by the social relations. Implicit in them are the power relations between different parties in terms of classes as well as sexes. The relative power one has will determine the outcome of a new situation. However, social relations are also conditioned by a specific historical and cultural context.

The introduction of new technology in tile making in Java has disrupted the social relations among its people, in particular between men and women. The specific cultural setting of the Javanese society has had a considerable bearing in mediating the impact of such a change on women which in many cases is unfavourable to women.

Sexual division of labour gets reconstituted with shifts in production methods and technology, but at any given point of time acts to distribute power, resources, authority in ways that keep women subordinated. In this shift, a new sexual division of labour may become more disadvantageous to women. It is apparent in tile production that the shift from traditional to more advanced technology has also shifted the sexual division of labour. Sexual division of labour is not something rigid nor constant. It changes over time depending on social, political, and economic forces. The realms of what constitute male and female are manipulated depending on the situation. As sexual division of labour is a product of gender ideology which is culturally and socially constructed, a link can be drawn therefore that ideology too is not something static.

The intersection of class and gender based on the category of households in tile production can be described as follows. In the better off households the women become dependents whereas in the transition households the women manage the 'traditional' sector while the men move to 'modern' sector. In the poorer households the women are more autonomous but constrained by insufficient economic means. In other words, class formation enforces a greater degree of subordination in some areas i e power and authority though the women may be better-off (in terms of living standards, reduced work load). They do more invisible work than visible work and hence are likely to be undervalued and undercounted.

Women's position is not simply a matter of participating or not in 'production'. It has much to do with the precise definitions of tasks within production, their relative value as determined by a valuation process which is in itself discriminatory. Given a predetermined sexual division of labour that is accompanied by unequal power within the household, the introduction of new technology tends to have effects that re-enforce subordination in one form or another. Women are more vulnerable to the introduction of technology because it invariably transforms the processes they are engaged in, into 'redundant' tasks. If for instance women had authority or power in conditions of production before the introduction of technology, the negative effect of being 'left behind' could be avoided.

In order to enhance women's position in the face of technological change great efforts are needed from many parties. Women should be given equal access to information, technology and capital. This means the need for institutional changes, but the more important thing is that changes in the attitude towards women. Technical change must be accompanied with conducive social change in respect to women.

Notes

[This is a revised version of the research paper submitted to the ISS, The Hague as part of MA in Women and Development.

I am very grateful to Mathievi Krishnaraj, my supervisor for her patience, understanding and intellectual wisdom in guiding me through the process of writing this paper. I wish t

acknowledge Benjamin White, my second supervisor, for challenging me to deepen my insights on the issues of technological change especially in the context of Java. To Denise, my mother-friend, for her encouragements and support, my deepest gratitude to her. I also thank the eleven students of the Faculty of Economics, Satya Wacana Christian University Salatiga, who helped me in gathering data in the field and Imajati, my mentor in conducting interviews with the rural women, to Philomen, for help with the language and my gratitude to Henry for allowing me the space to pursue these studies.]

1 See among others R Islam (1987), R Rothwell and W Zegveld (1985), M S Gamser et al (1990).
2 Some feminist scholars in their analyses have tried to include the complexity of relationship of women to production and technological change. See among others Palmer (1978), Bryceson (1985), Sen (1985), Stamp (1989).
3 The objective of new technology in the form of HYV is to increase yields. To achieve that some requirements with regard to the cultivation practices are necessary. For instance, a more careful land preparation; preparing the land more frequently; transplanting seedlings in straight rows; more weeding time; applying chemicals; harvesting thicker crop; processing greater crop. Land preparation, harvesting, and some processing are the easiest to mechanise, and they are often seasonal labour bottlenecks. Therefore, they are the first to be mechanised. While tasks like transplanting and weeding which are performed by mostly female family labour do not represent seasonal labour bottlenecks, therefore, the urgency to upgrade them has not appeared so great. For women who do these tasks it means that they have to work more hours in the fields on days they go into the field and more days in the week they go to the field. This is what Palmer meant by the more intensive use of female family labour.
4 A copper tool (with wooden handle) used for applying hot wax to the cloth.
5 Cement tiles are generally produced in urban areas. They are not made in this village.
6 Bengkel is the press machine producers who make and sell the press machine. In some cases they also give credits of the machine.
7 Wage workers here mean people who are employed on a continuous basis. Workers who work intermittently or those who are employed once in a while do not belong to this category.

Technology and Feminisation of Work

Iftikhar Ahmed

As a response to the twin challenges of feminisation of work and the feminisation of poverty, a combination of multiple policy strategies have been suggested for boosting women's productivity, expanding women's employment opportunities, raising income levels in women's jobs and mobilising women into participatory groups. What is the role of technology in this context?

OVER the past two decades there is a continued trend towards feminisation of employment both in developed and developing countries. In addition, if one takes into account women's unpaid work, particularly in developing countries, women in poorer households work much longer hours and have much less leisure time than the males [Buvinic 1993]. It is a little surprising that the trend in the feminisation of work has been accompanied by the feminisation of poverty in third world countries (Table 2). While jobless growth has characterised virtually every region of the world, women had to bear a much larger burden of unemployment over the past two decades (Table 3).

As a response to the twin challenges of feminisation of work and feminisation of poverty it has been suggested that a combination of multiple policy strategies for (a) the boosting of productivity in women's paid and unpaid work, (b) the expansion of women's employment opportunities, (c) the raising of income levels in women's jobs, and (d) the mobilisation of women into participatory groups be pursued as these together constitute the basic foundations of women's empowerment [Buvinic 1993].

Therefore, the purpose of this article is to review the role of technology in the empowerment of women in the context of rapid feminisation of work. The article deals with numerous new and conventional technologies and related policy issues. It begins with microelectronics and touches on biotechnology, technologies for sustainable livelihoods, energy technology choices, institutionalisation of gender biases and the scope for empowering women with technology.

Microelectronics: Reskill or Perish

A major reason for the feminisation of employment is the structural shift of employment from manufacturing to services in the advanced countries. For instance, there are as many women employed as men in the British economy now as compared to the 1960s when the number of women employed was only half that of the men [*The Economist*, December 11, 1993]. Overall, women account for 50 to 60 per cent of total employment in the financial services of advanced countries, yet they occupy only 5 per cent of the higher occupations [Rajan 1990]. In developing countries like India and Tunisia women account for one quarter to one third of total employment in this sector [Chopra 1991 and Ferchiou 1991]. Despite the inherent labour displacing effect of microelectronics application, women's share in overall financial services employment is, over the years, on the increase. Clerical work accounts for 70 per cent of the financial service jobs where the bulk of the women workers are concentrated (as high as 90 per cent in the UK) [Rajan 1991]. This is precisely the single most significant occupational group vulnerable to automation. In this occupational category, particularly the non-career clerical staff hold part-time jobs with low skills and less job security.

Evidence from industrialised countries suggests that the trend of the feminisation of clerical tasks in financial services has been accompanied by the deskilling of such tasks and/or the creation of part-time work opportunities for women following the application of microelectronics [Rajan 1991].

Evidence from Tunisia suggests that during 1983-87 women's employment in the financial services lagged behind the men's. Female employment grew at 4.6 per cent per annum as compared to 5.1 per cent for the males while the women's share in total financial services employment remained virtually unchanged during that period [Ferchiou 1991]. The financial services sector accounted for nearly 80 per cent of the microelectronics-use in Tunisia. The increasing share of employment of executive and managerial staff and technicians (computer programmers and systems analysts) has led to a higher growth in employment of males than females despite the availability of a higher proportion of fresh better qualified women graduates in computer sciences and business administration.

Microelectronics applications in the financial services appear to have regrouped several tasks under one job to hold on to which multiple skills have to be acquired by the worker. This could take two forms: (a) horizontal loading, i e, regrouping of unrelated tasks under one job, and (b) vertical loading, i e, regrouping sequentially related tasks under one job

TABLE 2: RURAL POPULATION BELOW POVERTY LINE IN THIRD WORLD BY SEX, 1965-70 AND 1980

(*in millions*)

	1965-70	1988	Per cent change
Women	383.673	564.000	47.0
Men	288.832	375.481	30.0

[Rajan 1991] Women workers respond enthusiastically to opportunities for reskilling obviously recognising that it is vital for saving their jobs. For example, when a bank in India offered the opportunity for computerised operations to its entire workforce, 12 per cent of the electronic data processing activities were taken up by women. This contrasts with the largest bank in India where exposure of only 2.5 per cent of its total employees to microelectronics led to 95 per cent of the electronic data processing jobs being captured by the males. As noted earlier, despite women accounting for a quarter of the financial services workforce in India, a very low proportion of them are engaged in electronic data processing [Chopra 1991].

Therefore, women threatened with deskilling by microelectronics applications in the financial services need to be included in an aggressive retraining programme for both 'reskilling' and 'multiple' skilling if the newly emerging jobs and occupations are not to be cornered by the males. New occupational structures are emerging. For instance, in one financial firm in Kenya nearly one third of the openings in the data processing department remain unfilled [Mureithi and Ndiritu 1991].

In the printing and publishing industry the proportion of female employment increased in both the US and Denmark due to the introduction of microelectronics. In the US the share of women workers increased from 25 per cent in the 1960s to 33 per cent in the 1980s. In absolute terms, the increase was 56 per cent. The gain in women's employment was accompanied by a fall in male employment. Therefore, it is concluded that women's employment was enhanced due to the replacement of traditional male craft skilled jobs such as linotype setting by office type skills possessed by women, such as input of text on phototypesetting visual display units (VDUs). Similar increases in the proportion of women's employment in the composing and printing work has been observed in Denmark [ILO 1990a].

It has been estimated that by the turn of the century more than 60 per cent of the North American workforce will be using VDUs. In Japan, 70 per cent of all enterprises already use VDUs [ILO 1989]. The bulk of these VDU users are obviously women workers. There is ample evidence from a wide range of countries on the adverse health effects on VDU users such as visual and musculo-skeletal complaints, as well as symptoms of stress [ILO 1989 and 1990a]. The ILO has produced guidelines on the safety and health aspects related to the use of VDUs. These include ways and means to improve the physical environment and ensure that the equipment is ergonomically sound, design jobs and organise work with VDUs so as to minimise any negative effects on health [ILO 1989].

Women account for the bulk of the workforce engaged in telework, which has been facilitated by new technologies like the availability of microelectronics.[1] While many women are engaged in telework because of the advantage it offers to combine such work with child care and household responsibilities, financial motivation and the advantage of flexibility were no less important. However, telework could lead to isolation, marginalisation and exploitation of women workers [Di Martino 1992].

Biotechnology's Double Edge

Women's work is relevant to both the application and generation of biotechnology. It has been noted that advanced agricultural biotechnologies contain both pro-poor and anti-poor potentials [Ahmed 1992]. For instance, reduced costs of agricultural production and greater scale-neutrality associated with the new biotechnologies could benefit the small farmers,

who were left out by the green revolution The green revolution technology increased the employment and income earning opportunities for women workers from landless households particularly in densely populated Asia However, the rapid commercialisation and worldwide distribution of the genetically engineered herbicide-resistant plant varieties will lead to a substitution of chemical herbicides for manual weeding largely performed by female wage labour Thus the genetically engineered herbicide resistant plant varieties will, on the one hand introduce a new fixed cost for farmers by compelling them to purchase the herbicide genetically tied to the seed supplied by the same multinational company On the other hand it will contribute to the massive displacement of female labour on whose earnings the poorest households depend for their survival

While the widespread application of the green revolution technology in general brought about significantly increased labour absorption it had a differential impact on female labour use Existence of factor price distortions led to the mechanisation of tasks previously performed by women e g in post harvest processing which massively displaced casual women wage workers [Ahmed 1985] However the increased labour demand in peasant households was met by employing unpaid female family members due to the ability of patriarchal authority in the peasant household to expropriate more work from such family members [Whitehead 1985] Biotechnology applications are expected to lead to a growth in agricultural output requiring even greater use of unpaid female labour particularly in peasant households The experience from the green revolution clearly suggests that the expropriation of unpaid female family labour will take place on a much larger scale than before simply because unlike the green revolution technology, biotechnology will be much more accessible to smaller farms and peasant households who depend largely on the pool of unpaid female family members for the extra farm work that will be needed

While the application of some of the newly emerging biotechnologies tend to threaten women's employment and make them vulnerable to exploitation women scientists could play a crucial role in generating biotechnologies targeted to meet the needs of the poor Women dominate the micropropagation laboratories in both the Philippines and Mexico For instance women constitute 80 per cent, 74 per cent and 85 per cent of the Philippine Society for Microbiology, Cell/Molecular Biology and Biotechnology Societies respectively [Halos 1992] One reason for such a concentration of women scientists in this profession is that it was considered a lowly paid job (shunned by the male scientists) concerned with basic science with limited linkage to industry in the past Another reason why the males were not interested is that work in the tissue culture laboratories is tedious requiring patience and perseverance

The little scientific capacity for biotechnology that developing countries possess is currently being channelled to cover non food crops and to meet the needs of the commercial and large farm sector Therefore it is clear from the above that women scientists could help launch a planned assault to solve location specific technical and socio economic problems by targeting the limited national scientific capabilities to fulfil the needs of both poor producers and consumers However since the rapid commercialisation of patented biotechnologies would bring in wind fall profits to the private corporate sector it offers the opportunity of raising the remuneration levels of poorly-paid women scientists

Women with the help of environmentally sound technologies could provide the crucial bridge between socio-economic sustainability and environmental sustainability It is often assumed that women are likely to be more motivated than the men to conserve the environment as they are more critically dependent on it for their survival However, not much concrete evidence has been furnished to demonstrate the validity of this hypothesis

An ILO survey of women in rural Kenya reveals that socio economic sustainability and environmental sustainability are not only interrelated but also mutually supportive [Omang'o and Mukudi 1993] The principal attributes of the household s socio economic sustainability are as follows (a) ownership of land, (b) more equitable farm size distribution, (c) stability of income and employment (d) diversification of cropping patterns, (e) greater food security, (f) satisfaction of basic needs (access to water sanitation and housing), and (g) application of productivity enhancing agricultural technologies

Farm labour is provided by 93 per cent of the women It is mostly (83 per cent) women who are seeking off-farm employment Half the women are aware of the adverse health effects of handling agricultural chemicals and nearly as many women report the use of protective gear by the households

Women who bear the responsibility for household water supply are most knowledgeable about water treatment technology and the majority (64-67 per cent) also have knowledge of improved sanitation technology Adoption rate of improved sanitation technology is low (36-40 per cent of the households) Lack of owner

ship of housing (60 per cent of urban slum dwellers) and excessive costs (40 per cent of rural households) are considered as constraints to adoption of improved sanitation technology. The extension services played a very insignificant role in providing information on both technologies.

It is remarkable that hardly anyone (87 per cent) depends on forestry for employment, despite residing in close proximity of the forests. The vast majority (93 per cent) are not only aware of official restrictions on forest exploitation but also support (82 per cent) its conservation. The reason given by the majority of the women further confirm their high sense of responsibility as 72 per cent wish the forest to be saved and 50 per cent see forests as a way of avoiding drought. Tree planting is practised by virtually all (97 per cent) households. It is remarkable that 35 per cent of the women participate in tree planting despite not having any ownership rights over the trees. Women are not only aware of alternative soil conservation technologies but the vast majority of them are engaged in soil conservation. Virtually all (93 per cent) of them recognise the positive ecological value of such techniques. Extension services have been a significant source (65 per cent of households) of information on alternative soil conservation technologies.

The impact of proprietary rights and dependence on natural resources on waste management is most dramatically brought out by the behaviour of two contrasting populations. In rural Kenya, the majority (67 per cent) of households convert animal waste into manure and use household waste in the farm. In contrast most urban slum dwellers dumped their household waste into garbage pits. In rural Kenya hardly any industrial effluent from tea/coffee processing plants were drained into the river.

The benefit cost ratios of biogas energy are systematically the highest for all farm sizes, socio-economic status and seasons in India (Table 4).[2] However, labour intensity varies by type of technology and socio-economic status and farm size (Table 5). Households dependent on unpaid female family labour might choose technologies on the basis of higher labour intensity.

Organisational bottlenecks may deprive the poor from exploiting the high benefit-cost ratios of biogas plants. As many as 63 million (out of a nationwide total of 75 million) of family-scale biogas plants in India do not possess the 3-5 cattle needed to supply enough dung to operate a family-scale digester [Bhatia et al 1994]. As regards the larger community/village scale biogas plants, sustainable use is feasible when there is a convergence between the individual self-interest and collective need of the community [Krishnaswamy and Reddy 1994]. The use of biogas plant energy for running submersible pump to lift borewell water for distribution to the community by pipes satisfies urgent individual requirements as well as high community collective priority. Drinking water supply is a higher priority over energy for cooking. The sustainability arose from the villagers understanding of the connection between the steady water supply with the need for prompt dung delivery by the beneficiaries.

A survey of the impact of technological change on rural women has revealed that technological change, particularly in rural areas, have for the most part led to the concentration of women in domestic and non-market roles and labour intensive activities. It has also been observed that technological innovations introduced in women's activities result in the men taking over women's jobs simply because the corresponding skills development training knowledge and working capital aimed at women are excluded from the new opportunities created often owing to institutionalised gender biases [Ahmed 1985].

It has been noted that rural factor market imperfections which contributed to class based inequalities could well deny the women access to technology and resources leaving them in occupations marked by low incomes and low productivity thereby creating and accentuating gender based inequalities. Factor price distortions have also led to the massive displacement of women workers from the poorest households by promoting technologies which are capital-intensive, e g, in post-harvest processing activities.

On a positive note, field-based ILO technical co operation projects for women from three developing sub regions (south Asia and western and southern Africa) indicate that it is feasible to widen and diversify women's income earning opportunities through the introduction of improved technologies. The application of improved technologies could generate women's employment in non traditional areas while upgrading technologies in women's traditional occupations could simultaneously raise their labour productivity and reduce the drudgery of work. Channelling of improved technologies through participatory organisations of rural women contribute significantly to women's empowerment. Fostering of linkages to commercial suppliers of technology and training institutes and marketing channels was a key element in the strategy for women's empowerment.

Notes

[This article is based on a paper presented to the Expert Group Meeting organised by UNIFEM on Women Science and Technology. A New Vision for the 21st Century in preparation for the 1995 Fourth World Conference on Women and the meeting of the Sub Working Group on Gender of the UN Commission on Science and Technology for Development New York December 14 18 1993. The author is grateful to Priya Basu and Steve Lautizar for the compilation of Tables 1 and 3.]

1 The term telework is also described as telecommuting, remote work and distance work and is ideally suited for part time work. 90 per cent of those engaged in part-time work consists of women workers.

2 Based on a survey of selected villages of Hisar district of Haryana in India. The costs were calculated on the basis of time used from procurement to utilisation market price of inputs and actual labour costs per day. The benefits consist of energy obtained and the energy value of the amount of fuel used (converted into mandays equivalent and priced at the prevailing market price).

Structural Adjustment, Feminisation of Labour Force and Organisational Strategies

Nandita Shah
Sujata Gothoskar
Nandita Gandhi
Amrita Chhachhi

The argument that SAP will lead to feminisation of labour and the availability of jobs for women needs to be examined critically in the Indian context. Based on a sound grasp of the impact of SAP organisational strategies which will strengthen women's resources in confronting the economic pressures need to be evolved.

THIS article is a contribution to the ongoing debate on the possible positive and negative impact of the newly introduced new economic policies (NEP) and structural adjustment programme (SAP) on women workers. The article attempts to link the political and social implications of these economic policies on women's lives and work with the development of strategies for survival and empowerment focusing on urban working women. Firstly we would like to state that these policies are not really 'new' in the sense that industrial restructuring since the 1980s had already started affecting industrial workers and these trends have intensified with the commencement of the IMF dictated SAP. The second part of the article focuses on the debate on feminisation of the labour force under SAP. The final section of the article presents some alternative perspectives and suggests organisational strategies in relation to women's paid and unpaid labour to improve the quality of their lives and lay the basis for empowering them towards transformation of the structures of their subordination.

Different reactions to the NEP and the SAP in India have emerged ranging from supporters, critical of Nehruvian policies to opponents who see it as a surrender of our sovereignty to foreign institutions and countries to the 'we have no choice' pragmatics. Political parties especially the Left parties have voiced their concern for different sections such as the working class, petty traders and entrepreneurs and indigenous industry through rallies, anti-price rise morchas and swadeshi campaigns. Women's groups have joined other progressive and voluntary organisations to express their fear of the possibility of a severe negative impact especially on the lives of working women.

These reservations and suspicions about NEP have some basis in our past history as well as the experiences of many other countries which have implemented them. With the acceptance of the IMF loan and its conditionalities, it is clear that India has now joined other Latin American, African and Asian countries which had accepted the terms for the IMF-World Bank loans.

However it should be noted that India had begun a process of 'adjustment' quietly since the beginning of the 1980s. Multinational corporations were encouraged to invest by the Indira Gandhi government and even by the Janata Party government. Rajiv Gandhi gave a glimpse of this process when he spoke of moving into the 21st century and brought in indiscriminate computerisation.

All three governments continued huge foreign borrowings, deficit financing and indirect taxation. By the time the National Front government came to power, the coffers of the country were more or less empty. Even though failure of their economic approach and the oncoming economic crisis were obvious to all three governments not one had the political will for making any real radical changes to turn the situation around. They continued with the facade of a mixed welfarist perspective whilst opening up a little now and then to the multinationals and the world market. It fell on the Rao government to take this policy forward by publicly announcing liberalisation. Its 1991 policy announcements can thus be seen not as a beginning of economic liberalisation but its inevitable consolidation.

It is argued that the Indian economy needs to be 'stabilised' by introducing fiscal and monetary restraint (deflation) and devaluation of currency. This, it is hoped, will reduce demand for imported goods and encourage exports and therefore bring down expenditure. SAP is meant to deal with the supply side by increasing production and efficiency in the production process. Incentives for private sector, privatisation of government owned units, delicensing, deregulation and disciplining labour are some of the means of 'adjustment'. In effect adjustment meant jettisoning the older model of the economy and opening up to what has been called the 'magic of the market' or a form of neo liberalism.

There are several theories on the failure of 'developmentalism' but the alternative posed seems to be worse than the problem. It is feared that the real costs of adjustment will be borne primarily by the most disadvantaged and vulnerable sections of society while the benefits would be limited to a small section. Numerous case studies on the effects of SAP in developing countries have pointed out that even where SAP leads to growth it does not necessarily imply development. For instance, in 1985 the Bolivian economy collapsed and had to be bailed out by a $ 50 million loan by the IMF. Rather than improvement the economy shrank by 3 per cent in just one year, real wages fell by half, food consumption went down by 40 per cent, number of factories were reduced by 55 per cent. There was a massive march of 7,000 people in La Paz for Life and Bread in 1986. These were explained away as teething troubles of the painful aspects of adjustment. But things did not improve in 1988 as inflation doubled, real wages continued to decline and one out of every four Bolivians was out of work. There was mass migration as government departments shut, miners lost their jobs and their wives took up agricultural work [Bank Information Centre undated].

Even success stories have tragic subplots within them. Ghanaian cocoa production had increased and the income of producers had jumped by 700 per cent in some cases. However the increase was uneven amongst agriculturists. Amongst the cocoa farmers only 18 per cent in the south were favoured versus the poorer ones in the north of Ghana while the majority of non cocoa producing farmers' per capita income stagnated. There were other more disastrous side effects. The emphasis on cocoa has led to a decline in food sufficiency, deforestation, which might mean the disappearance of timber, and a drop in fishing and high prices which have effected the nutritional levels of people. As new crises surface the Fund blames the government for mismanagement and extends more money for even more 'adjustment' (ibid).

There are numerous other studies by the ILO and independent scholars which show that SAP in many countries has on the whole failed to generate growth of income and employment. The balance of payments situation may improve, exports may rise given a good world demand but the majority

the people, especially the poor are no better than what they were before the introduction of these policies.

Where do women feature in the faceless, neutral rows of figures and general indicators of a nation's well-being? Are they affected by SAP in the same way as men? The evidence from a dozen case studies carried out by UNICEF showed that, "with a few exceptions, children and women of poorer families were the hardest hit by recession". Apart from the effects on nutrition, workload, mortality, etc, studies have shown how traditional industries which employed a large percentage of women were being closed after introduction of SAP. In Mexico, the 'maquiladoras' industry introduced changes in the labour process which transferred women working in the plant to self-employed work performed at home. According to a document by DAWN, "throughout different countries there is a growth of the intermittent activities, uncovered by labour contracts or social security". In Argentina unemployed women who are heads of households find it more difficult to enter the labour market than men [Antrobus 1990].

Structural adjustment programmes affect sections of working women differentially but the evidence from studies shows that it tends to shrink women's employment opportunities in the organised sector.[1] New employment opportunities are primarily in a small segment of export industries with low wages and extremely adverse working conditions. Under SAP real wages have declined for labour as a whole and again women have been particularly hard hit. In Brazil, women faced wage reductions ranging from 10 to 30 per cent depending on the sector they were working in [Kriti 1992]. There are many similar examples from other countries in Africa, Latin America, the Caribbean and Asia.

Indian women form a vulnerable and exploited group of people. India has one of the lowest sex ratios in the world of 1,000 males to 923 females. It is a further drop from the 1981 figure of 1,000 males: 934 females. Only 39.4 per cent of women are literate. Less women than men work for a living and for every three men only one woman uses health facilities [Batlivala 1984]. There are depressing figures on the number of rapes, dowry murders, sexual harassment and assaults on women. Some of the basic institutions of society have a shocking record of discriminating against women. For example, banks are reluctant to have women open accounts for their minor children in their names or extend credit for their minor children in their names or extend credit for their independent work. Courts, in spite of amendments in the rape and dowry laws, have convicted very few offenders or let them off lightly. In the labour market, the private sector has not been a major employer of women. The government is the largest employer of women but only in 'women-oriented' types of jobs as typists, nurses, teachers, etc. Whatever women require for an independent livelihood and existence such as work, housing, and other resources, are systematically denied to them by the norms of the patriarchal family and society.

Given the existing structure of discrimination against women, the introduction SAP via the NEP with its attendant problems of inflation, recession, restructuring of industry, fall in real wages, etc, will intensify and worsen conditions particularly for poor women. Many scholars and activists have pointed out that there will be a fall in working women's standard of living, poor nutritional and health level, an increase in the double burden of work and a brake to any improvement of their status in society.

So towards the middle of the 1980s, international agencies such as UNICEF began to express concern at the detrimental effects of SAP on women and children and put forward the proposal 'for adjustment with a human face. The World Bank too has been forced to respond to the criticisms of the impact of structural adjustment programmes on poor households but the 'compensatory programmes' adopted by it and other agencies to 'alleviate' poverty and inequality intensified by SAP have been shown to be inadequate and limited. Although the proposal for 'adjustment with a human face' highlights the disastrous effects of SAP and suggests protective policies, it does not question the macro-economic policy itself. It suggests improved policies with the expectation that 'enlightened governments' will act on these policies. In practice, governments have tended to ignore or adopt these policies in an indifferent manner. The overall framework within which these ameliorative measures are proposed are paternalistic, treating women only as victims and lack the potential to change the subordination that women face in the economy and society [Elson 1989]. By the end of the 1980s a more systematic effort was made to identify the specific consequences of SAP on women and suggest proposals to protect the position of women as well as incorporate their concerns into the process of adjustment as for instance by the report by the Commonwealth Secretariat, 1989. However, this report also tends to treat women only as victims and focuses on harnessing their 'productive potential' through policy changes rather than through empowering the women themselves.

A major assumption that informs such policy prescriptions is that if women are engaged in employment, i e, income earning linked to the market, there will be an improvement in their status. Based on this assumption there are a few economists who see the SAP as a ray of hope especially in the context of women's work. They argue that the SAP will introduce flexibility in the organisation of industry, in the production process and in the labour market. It will therefore generate low paying jobs which will go to women, thus increasing their work participation rates and generally helping in the alleviation of poverty. It is important for us as researchers and activists to critically look at these arguments as thay have a direct bearing on the development of strategies and the empowerment of poor women in their struggle for a better life.

Feminisation Debate

Analysts of present trends in industrialisation in developed and developing countries have argued that the characteristic feature of this phase of capital accumulation is 'flexibility', accompanied by a process of 'global feminisation' of the labour force. Flexible specialisation is based on the diffusion of microelectronic systems in production which overcome the inflexibility of Fordist production systems which were characterised by the assembly line with a high degree of division of labour in which workers were reduced to adjuncts of the machine. Fordist production required long runs of standardised products, large units and the maintenance of large inventories on a 'just in case' basis which increased costs. Post-Fordist or flexible production is based on decentralised small units of production, with subcontracting arrangements, minimum inventories similar to the Japanese 'kanban' or 'just in time' system, with flexible labour deployed over a variety of production tasks. The labour force is used only when required which means workers do not have permanent status, are paid low wages and deprived of statutory rights. The argument for global feminisation of the labour force has been put forward by Guy Standing (1989) who notes that the decade of the 1980s is both the decade of 'labour deregularisation' as well as a period marked by a "renewed surge of feminisation of labour activity". This is the period in which "labour and social rights became perceived increasingly as costs and rigidities"and the growth of very low wage employment. He argues that "when low wage jobs spread, it is women whose employment in them increases". Guy Standing uses the term 'feminisation' to refer to two processes: a rise in female labour force participation in the face of a fall in male participation rates and the feminisation of certain jobs that were traditionally performed by men, i e, the substitution of men by women.

Applying this thesis to India, Sudha and L K Deshpande (1992) state that this tendency towards feminisation of the workforce has been observed in official data at natio..al level as well as in the city of Bombay. They

argue that feminisation through flexible labour practices in urban labour markets over the 80s increased employment opportunities for women

In elaborating on the direction of female manufacturing employment, they note that employers in Bombay responded to liberalisation by employing women or retrenching fewer women than men Given that trade liberalisation is a major plank of the NEP, they estimate that production for exports will increase and since export industries are more labour intensive the total demand for labour will also increase In this context, they argue that the employment for women will increase faster than that of men, since women constitute a cheap and docile labour force

Sudha Deshpande (1993) goes further to say that "to the extent that it [NEP] is likely to increase the demand for labour in general and that for female labour faster than in the past, offer wider choice of occupation to women entering the labour market in the near future, and reduce the extent of poverty among families of these working women the change to NEP should be regarded as a positive change We must remember for the present that to be exploited in the labour market is bad but not to be exploited is worse

The assessment elaborated above is based on data gathered from different sources which show the trend towards feminisation particularly in the manufacturing sector However a number of questions and problems surface in the utilisation of statistical data which show general trends, especially when they are juxtaposed with specific case studies or with the experience of unionists, activists and researchers engaged in micro studies

In response to the thesis of global feminisation projected by G Standing Diane Elson has pointed out that although the data in the ILO *Yearbook of Labour Statistics* does indeed show the increase in women's share of total employment in a large number of countries, this need not necessarily imply feminisation It could in fact be quite compatible with the disappearance of many jobs of the type traditionally dominated by men, and the expansion of jobs of the type traditionally dominated by women' [Elson 1991]

To establish the case for feminisation of the labour force in India, the Deshpandes use the Annual Survey of Industries for India which puts out a fairly detailed break-up of industrywise percentage share of female workdays in total workdays in India, 1971 and 1983-84 (Table 5, p 2250) Based on this they conclude that " industries in India used proportionately more female labour in the early 80s than in the early 70s" Whilst this is true in some industries, their table also shows that in silk synthetics, the percentage of women employees declined from 5-10 to 1-5, in the food industry it declined from 21+ to 5-10, in wood products it increased form 5-10 to 10-15, in the chemical industry it increased from 5 10 to 10 15 in food products from 5 10 to 21+ Out of 19 industries, 10 have remained stagnant, two have reduced the employment of women and seven of them register an increase The data therefore suggests a more mixed picture rather than a definite trend It also raises the issue of examining such data along with the weight of each sector of production

A similar problem arises in relation to the next set of data used as evidence which was compiled from the records of the chief inspector of factories, Bombay (Table 7 p 2251) It indicates that industries employing more than 50 per cent women have increased from 0 6 per cent in 1975 to 2 5 per cent in 1981 to 3 1 per cent in 1989 The article unfortunately does not go into any details as to which industries employ such large numbers of women Without this information the data can be deceptive For example there are several units in SEEPZ employing not more than 30 40 employees Some of these are 90 95 per cent female dominated However, just down the road Larsen and Toubro and Mahindras employ more than 6 000 8 000 workers with hardly any women workers among them It is therefore important to know specifically which industries have increased the recruitment of women

The work participation rate of women in relation to men in manufacturing industry is abysmally low When assessments are made in terms of percentages it is important to keep in mind that the relative position of male workers remains high and the increase in female workers in actual numbers is quite low The interpretation of NSSO and census data for Bombay is indicative of a major increase in women's employment and thereby reflecting a trend towards feminisation could be questioned The Deshpandes argue for instance that male employment during the decade 1981 and 1991 increased at 1 6 per cent per annum while that for females increased at 5 9 per cent per annum [Deshpande and Deshpande 1992 2249] This means that between 1981 and 1982, the employment of men increased from 1 000 to only 1,016 and in the case of women it increased 'substantially' from only 125 to 132 women

At first glance, it does appear that the number of women employed has risen over the last few decades The proportion of women in total employment, which includes agriculture, manufacturing, the service sector and informal sector, has shown an increase The total work participation rate for the male workforce at an all India level fell from 52 65 in 1981 to 51 52 in 1991 The female rate on the other hand rose from 19 77 to 22 69 in the same period [Provisional Census 1991] However, it is necessary to look beyond these broad trends based on aggregate data and examine complementary data sources in order to qualify and reinforce this generalisation

The Provisional Census categorically states that the higher female work participation rates could be due to the fact that more women were netted This could have been the result of conscientising and training census officials and field workers In addition the increase in women workers is more in rural areas from 23 18 in 1981 to 27 06 in 1991 while in urban areas it is only from 8 32 in 1981 to 9 73 in 1991 [Provisional Census 1991] It is also necessary to specify what kinds of jobs are being done by women or are being taken over by them from men Nirmala Banerjee (1989) points out that while the 1971 81 decadal growth of women in manufacturing (an increase of 60 per cent) could imply a reversal in the earlier trend towards a decline in women's employment as well as entry into new industries, however the overall proportion of women workers in urban modern industries was still below 12 per cent in 1981 She points out further that far from a breakdown in the sexual division of labour All that happened was that either woman type occupations had expanded or some occupations had become more identified with women" [Banerjee 1989]

Qualification of statistical data is also necessary to ward off the problems of contradictory sets of data especially from gov-

ernment sources For instance, how does one explain that the figures from the Statistical Pocket Year book of the Government of India (Appendix Table 1) shows that women's employment in the manufacturing sector has increased from 372 000 in 1961 to 461,000 in 1989 but their proportion in total manufacturing has declined from 11 per cent to 9 per cent or is almost stagnant from 1966 to 1989 at 9 per cent

Disturbing Observations

So far numerous micro level studies have shown decline in the employment of women Renana Jhabvala (1985) and Mira Savara (1982) have documented the decline of female employment in the textile mill sector in Ahmedabad and Bombay over the past few decades due to automation Other case studies in the city of Bombay show how many large scale industries which employ women in large numbers have replaced their women workers by either men or machines or both [Gothoskar and Banaji 1984] If there has been a reversal to this trend, it is necessary to specify in which industries this has occurred

Case studies of particular companies indicate that expansion of production facilities in the 1980s have not resulted in an increase in the employment of women For example Hindustan Lever had only two large plants in Bombay and Calcutta for over 60 years From 1982, Levers decentralised itself to have 20 other plants, besides a network of smaller units which were subcontracted In the 1960s the Bombay plant employed a substantial proportion of women employees, about 600 women out of a workforce of 1,500 However in 1990 there were only 3 women left None of Lever's other plants employ women in any substantial numbers except the garment's plant at the Export Promoting Zone in Kandla, Gujarat [Gothoskar 1992]

A similar process has been witnessed in the mining sector [Sen 1990], the chemical sector and in various sectors in engineering, toiletries, particularly affecting jobs such as packing where women are employed [Gothoskar 1992] A study done by Sharma and Sengputa (1984) in SEEPZ the export promotion zone in Bombay showed that 98 per cent of its workers were women However in a recent interview, the Labour Commissioner said that this proportion has been reduced to about 60 per cent in 1991

In 'complementary' units or subsidiaries to large industries such as the powerloom industry in Bhiwandi and Surat, women are completely absent According to a comprehensive study of the powerloom sector conducted at an all-India level by the Ministry of Labour, government of India, women constituted a mere 5 per cent of the labour force in 1988 In the handloom sector however, where the wage levels are much lower, women constituted 44 per cent of the workforce Here women were invariably paid piece rates which were very low [GOI 1986 87] Whereas in the large and organised industries even contract workers are mostly always men

It has often been argued that when large plants are closed or reduce their operations the employment is diverted to the small scale sector so there is a net increase in employment This is not always the case because the small units, usually ancillary ones of the parent company are automated and require few workers For example, the Pantham plant of Rhone Polec (earlier May and Baker) employs 55 workers, mostly men who do the work which in Bombay was done by 300 workers However smaller units which are exempt from labour regulations do tend to employ women as studies of chemical industrial estates in Ambernath and Kalyan have indicated although the recruitment of women in comparison with men is low [Gothoskar 1992] Within the completely unorganised sector women are employed only in jobs which are seen as women oriented such as garments or food processing Small scale plastic units prefer men giving the usual rationale that hard manual work and night shifts disqualify women from these jobs [Gandhi and Shah 1992] It is therefore important not to assume an automatic relation between decentralisation and increase in female employment

In examining the data for feminisation of the labour force it is useful to make a distinction between different referents of feminisation since these are often conflated Feminisation of the labour force has been used to refer to one or all of the following

(1) Increase in the female participation rate relative to men

(2) The substitution of men by women who take over jobs traditionally handled by men

(3) The increase in women's involvement in 'invisible' work, i e, family labour and homeworking and

(4) The changing character of industrial work on the basis of new technology and managerial strategies whereby work is decentralised, low paid, irregular, with part time or temporary labour contracts, i e, increasingly like 'women's work' (but which is not necessarily done by women) [Chhachhi and Pittin, forthcoming]

An analysis of trends depends on which aspect/s we refer to in identifying 'feminisation' Looking at the shift to export led growth in large-scale manufacturing in Turkey in the context of structural adjustment policies, Cagatay and Berik (1990) conclude that "the shift to export-led growth has been achieved without an accompanying or subsequent feminisation of employment" However they do document an increase in homeworking The role of the state is significant in the discussion on feminisation or defeminisation Lack of feminisation could be due to gender typing of industries in the context of labour repression, which reduces the labour cost advantage of women workers *vis-a vis* men

A major recommendation of SAP is privatisation to make industry more efficient and profitable Privatisation would have significant implications for women's employment An examination of figures for 1974 and 1988 of women's employment in the public and private sector shows that women s employment has risen more in the public sector rather than the private sector i e in sectors such as electricity, construction trade transport communication finance and insurance and community services In the mining sector, women's employment increased in the public sector by 149 8 per cent and declined by 86 27 per cent in the private sector In the finance and insurance sector women's employment increased in both the public and private sector by 352 8 per cent in the public sector and by 273 per cent in the private sector Generally speaking the manufacturing sector is largely privatised Here too women s employment increased by 205 per cent in the public sector and 108 8 per cent in the private sector (refer to Appendix Table 2)

State owned units are now under pressure to re organise Nationalised banks, in which 20 per cent employees are women, have declared 4 lakh people as surplus Railways have stopped recruitment The Post and Telegraph Department intends to retrench ing 2,00,000 workers [Patel 1992] Privatisation when it does take place will result in a drastic cut in the workforce and women will be the most potential targets

The issue of women's employment in the context of the NEP has to be seen in the broader context of the rise in general unemployment Projections on the effects of the economic reforms on the employment situation by economists state that even under the most favourable conditions of growth, unemployment as a result of the present policies of the government "will rise from less than 3 per cent in 1990-91 to about 5 per cent in 1993-94 This implies total open unemployment of about 18 million persons in 1992-93 and 19 million the year after" [Mundle 1993] According to this study, in the context of a low growth scenario, additional unemployment will increase to about 22 million in 1992-93, going up to 25 million by 1993-94

The projection of low growth might be closer to what is likely to happen given the continuing industrial recession, at national and international levels In addition,

government as well as management strategies to handle this recession as well as control labour, through decisions such as increasing automation, shifting production to remote areas, etc, would swell the ranks of the urban unemployed

Even though the government is ostensibly holding back on the exit policy, the process of job loss has been underway for some time One form has been through factory closures There has already been a sharp increase in the number of sick units in the country The number of sick units had increased by 37,000 between December 1987 and December 1988 and by December 1990 an additional one lakh units had become sick taking the total number of sick units to 3 46 lakh [CMIE 1992] According to a survey carried out by the Gandhian Labour Institute, 65 units become sick every day and at any time 98 per cent of the total sick units are in the small scale sector In the large-scale units, about two million workers are affected by industrial sickness in industries such as jute cement, textiles engineering paper, iron and steel In the small scale sector about 1 5 to two million workers are estimated to have been adversely affected An aspect of the liberalisation policy which has intensified this process is the removal of the threat of nationalisation of sick units This threat acted as a significant restraint on unscrupulous activities of business houses Now there is no check on maltreatment of workers or siphoning off profits into other activities [Thankappan 1992]

In another survey of 80 large scale plants in Bombay, 16 had closed down or were on the verge of a closure These employed workers ranging from 200 to over 3 000 Out of the rest except in one company there was a virtual ban on recruitment since the late 1970s and mid-1980s Amongst these, in 67 plants, the management had introduced 'Voluntary Retirement Schemes' to get rid of the workforce Most of these schemes were not voluntary in terms of the pressure that employers put on the workers, particularly older workers and women to leave their jobs In plants such as Hindustan Ferodo and Hindustan Lever, more than one-third of the workforce was asked to leave and lock-outs were imposed to achieve this purpose [Gothoskar Dudhat, Havla, Vaidya and Halal 1991]

What is going to happen to this large mass of unemployed men and women workers? Retrenched workers will enter the unorganised sector, looking for jobs in an already crowded sector Women workers already constitute the most exploited section of this sector Ela Bhatt has pointed out that it is the unorganised sector which is being hardest hit by the structural reforms [Bhatt 1992]

The entry of workers who have lost jobs in the organised sector, into the unorganised sector also has to be differentiated according to skill, gender, marital status On the basis of research on retrenched workers from the formal sector, in Sao Paulo, Brazil, Hirata and Humphrey (1991) point out that it was unskilled men, single parents (mothers usually) and older women who are forced into taking up jobs in the unorganised sector For women this was primarily in domestic services, cleaning, etc Adult skilled male workers on the other hand were able to remain in open unemployment till they could return to a factory job "The adult males, with the exception of older, unskilled men, were able to secure their identities as industrial workers, even if this meant periods of unemployment of five months or more " A similar process in relation to male workers from industries which have been recentl privatised can be seen in Pakistan. While al workers were retrenched with golden hand shakes, skilled workers were re-employe in the same industries while the unskille entered the unorganised sector [2]

The evidence emerging from interview we are conducting as part of an ongoin research project indicate that both male and female workers retrenched from th organised sector are finding it difficult t get new jobs Shobha was a permanen employee in a pharmaceutical company wh took the VRS eight years ago, rather tha agree to work as a contract worker when th management initiated a strategy t redesignate existing workers as contrac workers and employ new workers on con

The Year Book of 1984 does not give these figures for the year 1983

tract paying them much lower wages. She explained that "she had been looking after her sister's daughter since the last four years, after almost all our money from the VRS got over and all our hopes of getting another job were dashed. My husband was also working for PCI. He too was tricked into taking VRS. He too has tried to get several jobs, but all in vain. See both of us were very good in our work. The management could not point a finger at us, so we were tricked. But in the outside world our skills are meaningless. This we came to know when we began to look for work.

Given the tendencies identified above we feel it is too premature to state that a process of feminisation of the labour force has started in India. Far more research including case studies and time series data on changing trends in different sectors needs to be carried out before such a generalisation can be arrived at.[4]

A major problem with the notion of feminisation through 'flexible labour practices' is that it does not take into account the sexual division of labour in the production process and in the labour market. Since the inception of industrialisation there has been a clear sexual division of labour, for instance in textiles, mines and later in the chemical industries, engineering and electronics; women workers were assigned to only specific jobs, primarily assembly and packing, while men were assigned a wide range of jobs, including supervision, maintenance, etc. The relationship between industrialisation and women's employment has never been uni-directional. As Pearson states "how industrialisation affects the gender composition of the labour force within and outside factories depends on the specific context. There are various considerations: the kind of industrialisation strategy, the sectoral composition of newly established and expanding industrial production, above all the supply of men's labour and women's labour for industrial employment."

In India, Banerjee has pointed out that there is an all embracing ideology shared by employers, men workers and even accepted by women workers, which sees the male worker as a superior worker. "The jobs that women have got in industry has little to do with skill or capacities but ... went to women entirely at the discretion of male workers," reflecting the power position men occupied in society [Banerjee 1991]. In cases where men have taken over women's jobs this has usually been associated with a reorganisation of production due to technical change or an improvement in wages and working conditions. For instance, Banerjee notes in the electrical industry women did armature winding for electrical fans but as soon as the wage rates for that job went up, it was taken out of their hands. Such reversals, also noted in large scale industries such as pharmaceuticals and toiletries where women dominated jobs such as packing and assembly have been taken over by men, often lead to a redefinition of these jobs as men's work. On the other hand where management has employed women for jobs previously the exclusive preserve of male workers, these jobs are redesignated as women's work. In relation to flexibility and feminisation it is necessary to bear in mind that the "gender division of labour, which tends to confine women to relatively subordinate and inferior positions in the organisation of monetised production, is not overridden by 'flexibility'. Rather it structures the form that 'flexibility' takes" [Elson 1989].

The projection that NEP will create a demand for the labour of young unmarried girls in the export industries depends on competition in the world market. The shift of capital back to countries in western Europe, the developments in new technology (another feature of 'flexibility') which require closeness to markets, the increased pressure for protectionism in the west, the opening of eastern Europe as a site for labour as well as a market and the requirements of high quality products which demand skilled labour will all impinge on how far India will have access to the world market. There is no guarantee therefore that export industries will expand. In addition, an important factor affecting the possibility of women's employment in these industries, if they do expand, is that given the levels of general unemployment, it is possible that "at least a section of this male labour force will come to bid for those jobs which so far have been allotted to women. In which case, it remains to be seen how far the inherent preference for male labour on the part of employers, that we had earlier noted, will come back into play" [Banerjee 1991].

Multiple Survival Jobs

On the basis of the experience in other countries undergoing SAP, the prospects are that women workers would be involved in survival level jobs, probably two jobs, in combination with domestic labour. This will impinge on the time available for their domestic work. Inflation and wage cuts will reduce the family's purchasing power, forcing women to find even more time-consuming ways of cutting expenditure. Data on women's paid and unpaid work in the context of SAP shows that women's unpaid work has been intensified. In a small survey of 400 households in Buenos Aires in 1984 it was found that half of them were spending 40-80 hours week on household tasks (or 7 to 11 hours per day). One third, especially women with large families, were spending 80 hours and two thirds more than 80 hours on both jobs and family [Carmen and Iehn 1987].

Economic crisis situations lengthen the total number of paid and unpaid working hours of women. It is possible to inter relate

Chart

SAP Features	Effect	Women's Lives
* Export oriented cash crops * Cut in fertiliser subsidy * Devaluation of rupee * Cut in subsidy in PDS	High food prices	* more time processing * purchase in whole sale * low nutritional status
* Underemployment * Unemployment * Low paid work * Wage freeze * Withdrawal of workers benefit * Cut in employment schemes	Low income level	* multiple jobs * lower standard of living * fall in real wages * longer working hours * poverty level
* Cut in public expenditure * Expensive drugs	Poor health services	* no access * increase in child mortality * pre natal mortality * disease/illness * more health care at home
* Increased prices of water, fuel electricity	Deteriorating civic services and housing	* more time fetching water fuel * longer cooking time
* Higher land prices		* longer commuting time * scarce housing * unhygienic conditions
* Privatisation * Deregulation * Delicensing * Recruitment of flexible labour * Closures and job loss	Insecure livelihood	* subcontracting * retrenchment * VRS * unavailability of credit * low bargaining * Insecure life
* Loss of job opportunity	Increasing crime	* Increase in criminal gangs

some of the features of SAP with its economic consequences and effects on women unpaid and paid labour. A modified version of a chart, based on one developed by UNICEF for child welfare and development which shows such linkages, is presented below [UNICEF 1987]. These directly linked relationships are a part of a larger web of inter-relations between production and reproduction, domestic and wage labour, gender construction within the labour process and the sexual division of labour in the household (see the chart).

The linkages elaborated in the chart are not too far-fetched as India experiences the highest rate of inflation since 1983. The prices of essential commodities have risen from 2.6 per cent in 1984 to 11.8 per cent in 1990 to 16.7 per cent in 1991. The Public Distribution System (PDS) has so far provided the poor with subsidised food but is now in the process of being 'revamped', which means either suspended or restructured. As family income becomes insufficient, women will have to put in more time to make less stretch for more. They will spend more time in domestic labour with little help except from their older daughters. This burden of multiple jobs and extended domestic labour will sooner or later take a toll on their health. The combination of this with the pre-existing discrimination in food allocation to women and girls will result in a serious health crisis. A fall in nutritional levels will leave them prone to illness, disease and pre- and post-natal complications.

It is possible that working women will reach a point of total collapse but it may not be noticed for their oppression and vulnerabilities are easily masked by the family, explained away by the state and ignored or exploited in the marketplace. Given this situation it is imperative that we also focus specifically on women to develop organisational strategies which can strengthen them in confronting these economic pressures. These strategies could also lay the basis for transforming exploitative relations within the family, in relation to the state and in the market, thereby empowering working women as well as the communities they live in.

Alternative Perspectives

The economic reforms are now entering the second phase. So far the government has devalued the rupee twice (the exchange rate for the dollar went up from Rs 20 to Rs 25 and the second time from Rs 25 to Rs 31), many areas formerly earmarked as public sector units such as leather, chemicals, etc, have been delicensed. The 1993-94 budget has cut duties on consumer and other goods. The exit policy and a new Industrial Relations Bill are being discussed. The government is aware that the poor might be severely affected and has promised safety nets. The National Renewal Fund with its limited budget allocation is inadequate for the number of workers who will be unemployed as well as the number of workers who will be unemployed as well as the number of purposes it is supposed to be used for. Originally seen as providing funds for redeployment as well as retraining, it is now being used primarily for voluntary retirement schemes.

Economists and activists have challenged the government's claim that this form of structural adjustment is the only solution to the balance of payments crisis. The first issue which arises is the manner in which the negotiations with the IMF were conducted and the present policy is being implemented, i e, the issue of democratic participation. Trade unions, voluntary organisations, women's organisations and concerned individuals have demanded the right to information, specifically on the reasons for the present budget deficit, as well as accountability and acknowledgement of responsibility for the present economic crisis. Negotiations with the IMF were shrouded in secrecy when in fact in a democratic country there should have been a national debate or even referendum on this issue (Open Letter, FFWAP, 1992).

Clearly the new international development discourse on 'transparency' and accountability' needs to be actualised as well in the relation between the state and civil society. How can a government claim to express the will of the people when it misinforms, ignores and overrides the alternatives proposed by various groups and individuals.

Opposition to the IMF has been combined with proposals for alternative economic policies which could pull the country out of the present crisis. For instance, suggestions have been made for alternative methods to garner indigenous resources, by imposing austerity measures on the rich and their affluent consumption. The government could increase direct taxation on those who can afford to pay. If it summons up the political will, it can bring back capital into the economy by reducing the size of the estimated Rs 1,80,000 crore black economy, freezing of foreign accounts of Indians including Swiss Bank accounts (an estimate puts this to 150-450 thousand crore) and blocking smuggling and gold imports [NCHR 1992].

Reduction of defence expenditure which is growing every year is another option. In 1982 India's military expenditure was 53,193 million rupees (US $ 6,325 million) and in 1991 it rose to 1,65,157 million rupees (US $ 9,033 million). In south Asia, India is the largest buyer of conventional weapons.

Rather than expenditure for unproductive and destructive purposes, the same funds could be used for socially useful production and development purposes.

Since globalisation under IMF conditionalities and an environment of protectionist tendencies in western markets can only mean a continued subordinate role for developing countries with the constant threat of being turned into primary producers, efforts could be directed towards building south-south links which will strengthen the developing countries bargaining power vis a vis developed countries.[5]

Steps towards such links have been taken by worker leaders and trade union activists who have established networks at a south Asian level. Along with formulating joint strategies in relation to SAP and multinationals for workers' rights the resolutions also call for opposition to military action by one south Asian country against another and demand that south Asian governments establish economic and political links in the region.[6]

Resistance to attempts towards total control by multinational corporations and international agencies has also shown the possibility of alternatives as for instance the action by the Karnataka Rajya Raitha Sangha, a farmers organisation in Karnataka in organising a massive demonstration in fron of Cargill Seeds to protest against the gene theft by multinationals and against the pressures of the Dunkel proposals which led to the withdrawal of Cargill. The debates around the Dunkel proposals has brought to the fore alternative perspectives on agricultural development which would be ecologically sensitive and sustainable.

At a macro level economists have argued that the international monetary system need to be restructured so that the costs of adjustment are also borne by surplus countries. Mechanisms to ensure that developed countries also take responsibility for the economic crisis have to be evolved as well as ways to ensure that developing countries have more control within the international financial system.

Although alternatives have been presented the government has not responded to any of these proposals. At the national level, opposition to the NEP by different sections has continued. The established national trade unions have organised massive rallies in the capital to express their opposition to the erosion of workers' rights and the proposed policies. The first general strike was called on November 29, 1991 the second on June 16, 1992. A number of demonstrations have been held against the new Industrial Relations Bill and recently against the new pension scheme.

In resisting the onslaught of SAP on workers, trade unions are following a three-t approach struggling against job losses, c

sures and lock-outs, preventing privatisation of public sector units; forming workers' co-operatives. In some cases these struggles have been successful. The long and arduous struggle of workers of the UP Cement Corporation against the take over attempt by the Dalmias, forced the government to halt their plans for privatisation in October 1991. Workers have presented alternative plans on restructuring their industries without recourse to privatisation. National Projects Construction Corporation employees have provided an alternative proposal to turn around the sagging company. Kamani Tubes have already shown the possibility of forming a workers' co-operative. The Kamani Union used the support of professionals and management consultants to develop a financially viable alternative plan which was submitted to commercial banks for a loan to assist the buy over. In addition workers invested their gratuity and redundancy claims. After a long legal battle asserting the right of workers to take over the firm, the Kamani Union won and today run a manufacturing plant with over 600 worker shareholders. Subsequently, a number of similar worker-run enterprises were set up.

Such initiatives for worker-run co-operatives in the context of privatisation have also emerged in other south Asian countries. For instance in Pakistan there are now 10 successful worker/employee take overs. A significant development has been the links established between these enterprises at a south Asian level. In November 1993 a team of worker leaders and managers from these enterprises in India and Pakistan visited the Mondragon Industrial Co-operatives in Spain which has been highly successful in reconciling modern industry with ideas of social justice and democratisation.[7] Efforts are now underway to develop co-operative relations at the shop-floor level as well as to transform enterprises taken over into truly self-managed co-operatives. Further links are being established with co-operatives in China.

These initiatives are very significant but they are limited since they are concerned with workers in the organised sector. (So far very few initiatives have involved women workers.) Trade unions have yet to respond to the changing pattern of industrialisation with its emphasis on decentralisation and subcontracting. They have not been able to organise the growing number of workers in the small-scale sector or workers who are casual wage labourers or home-based, a major section of which are women.

Rather than established trade unions or political parties it is other organisations which have taken up the cause of workers in the unorganised sector and particularly of women workers. SEWA's pioneering work in making visible and organising self-employed women is well known. Annapurna in Bombay has organised the khanawalis (women who run home canteens). The Working Women's Forum in Madras has brought together thousands of women by giving them credit for self enterprise. The Tamil Nadu Construction Workers Union has been successful in organising hundreds of workers to demand benefits and social protection.

There are lesser known examples of small groups or church-based ones organising domestic servants, construction workers, beedi workers, etc. Most of these organisations have been quite flexible in responding to the varied needs of women workers. The Tamil Nadu Construction Workers Union, for instance, also takes up cases of wife-beating, death, health, marriage and other disputes. The Chhattisgarh Mines Sangram Samiti in Madhya Pradesh has set up a hospital The Chikodi Taluka Kamgar Union in Maharashtra, an organisation of tobacco workers has set up a shelter for women in distress. These organisations have formed new structures to allow for greater participation of union members, especially women which has initiated a process of democratisation. There are caucuses of women within the larger union, or dual organisations for workers' rights and women's rights, or united fronts for neighbourhood issues and women's rights.

Paradoxical as it sounds, today trade unions can no longer only organise their members on the basis of their identity as workers. Given present trends in industrial restructuring as well as communalism within the labour movement, it becomes essential that organisations recognise the multiple identities of workers, which include gender, caste, religion, ethnicity. The processes whereby these identities are constructed and the shifting basis of identity alliances has to be taken into account in organising at the workplace, within the community and the household.

Strengthening Survival Strategies

So far women's organisations have joined various forums to protest against the NEP and SAP. In addition it is imperative that we develop strategies to strengthen women workers as they face the onslaught of the economic reforms on their lives. We can learn from the struggles waged by women workers in other countries undergoing SAP. The strategies we develop will have to relate to the specifics of our economic situation and culture of struggle. They will have to constantly bridge the gap between the workplace, community, neighbourhood and household. These would be intermediate strategies which can provide support for women in the present context, yet contain within them the possibility for transforming exploitative relations and lay the basis for self-determination.

Such strategies have emerged as 'spontaneous' responses to the deteriorating standard of living in countries undergoing SAP. Women from low income households have had to evolve various survival strategies. Survival strategies have been seen as essentially defensive with little potential to change the general conditions under which individuals and households survive. Concerned with basic survival they are seen to be individualised, and limited to immediate objectives. However, these survival strategies do imply an engagement with the immediate environment and as Daines and Seddon (1990) point out they do have "the potential for the development of more effective, more sustained and more collaborative forms of struggle.." Cornia has documented and classified the range of survival strategies which the poor, particularly women have resorted to in the context of SAP. These are: strategies for the creation of resources which include increasing own production, increasing sale of labour, sales of assets, increasing production through voluntary labour exchanges and co-operative work and transferring income to aid poorer relatives; strategies for conserving and improving the use of existing resources; and extended family and migration strategies.

The potential of these survival strategies to become transformative ones is best seen in the evolution of communal kitchens (comedores populares) in Lima, Peru which emerged in the 1980s as a response to the deteriorating economic situation. Groups of 15-50 households jointly carried out bulk purchase and preparation of food. Women cooked the food on the basis of daily shifts every four or five days, with each household paying according to the number of meals required. Poorer households were either exempted or given food on credit. The communal kitchens thus became "instruments of redistribution in favour of the poor" [Dianes and Seddon 1990]. Women were freed from daily cooking and were able to engage in other activities as well as participate in political meetings. Preparation of meals became a collective task which represented an organisation and division of work which was radically different. Entry into public spaces led to interaction with NGO activists and feminists. "Thus women's responsibility towards their families and their children's health and future became a source of energy and action that has permitted them to break with traditional patterns. It has permitted them to enter the public sphere and even, in the last five years, to pass from protest to proposal, and to become active participants in proposing social policies. For example, in 1987 the National Coordinator of Communal Kitchens elaborated a proposal whereby urban family consumption was linked with agricultural production". Similarly the 'mothers' clubs' where

mothers took turns to manage child care centres have also freed women for other work

In our own context it is possible to develop similar initiatives. Women's groups can help local women to form consumer co-operatives for wholesale purchase of essential commodities. Organisations working with women in 'bastis' have already started organising around the PDS. The Sabla Sangh in Delhi for instance had a campaign around ration shops calling for controls over corruption, fairer prices and public display of items in stock. Representatives of these organisations could be involved in monitoring the ration shops to ensure fair prices and distribution. This was attempted in Bombay by groups of NGOs and women under the banner of Ration Kriti Samiti.

In a situation where neo-liberal calls for withdrawal of the state are intensifying, women's organisations will have to redouble their efforts to ensure that the state not only continues to subsidise food distribution but also extends support in other areas through the provision of services such as easy access to water, creches, etc. Existing services which are provided usually by NGOs could be extended. For instance running balwadis is a common activity for most organisations. However they are usually open only for a few hours for pre-school children. With the same infrastructure it is possible to extend balwadi hours for the whole day for small children of home-based workers.

Strategies and policies for working women have to incorporate the various dimensions of women's multiple identities. A policy for women's employment has to support strategies for changing gender ideology both inside as well as outside the workplace. Notions of masculinity and femininity affect skill definitions, wages and working conditions and the location of women within the production process as well as within sectors of industry. The integral link between the household, workplace and community affects women's work as well as their potential for organising. The issue of the sexual division of labour within the household has to be equally significant as an issue as are strategies to keep jobs for women or get jobs for women. In spite of the highlighting of the double/triple burden of working women, domestic labour as the major responsibility of women continues to be the most resistant to change. In Cuba in the 70s a law was passed which made it possible for women to take their husbands to court if they refused to share in housework. Although there have hardly been any convictions under this law the existence of such a legal regulation could play a role in forcing a questioning of the sexual division of labour.

The present trends towards flexible specialisation has led to a discussion on the dual character of flexibility. Part-time work for instance could allow greater choice about hours and patterns of work. However it is then necessary to ensure that flexible workers enjoy parity with full-time works in relation to wages, benefits and rights. A recent ruling in the European Community states that flexible workers should be guaranteed these rights. Employer strategies to reduce labour costs by decentralisation and subcontracting could be countered by extending labour legislation along the whole chain of subcontracting and making the large firm responsible for the rights of workers in the smaller units. Similarly the ESIS medical scheme should be extended to all workers.

At a macro level ILO conventions should be put forward as a non-negotiable conditionality in the context of economic reform. A legal provision for the registration of all workers, contract, temporary, home-based etc, who could be provided with identity cards could counter attempts to redesignate workers as self-employed and deny them their rights. This strategy has been followed by SEWA for bidi workers. A code of conduct for multinationals and other large companies could help in monitoring production and prices.

Most women perform low skill, manual jobs which gives them a weak position in the labour market. Training women to develop new skills and enhance existing ones has been recommended time and again. Attempts at training women such as the courses in non-traditional skills in carpentry, wiring, masonry, plumbing, etc, run by the YWCA has been very useful although there have been mixed reactions to these experiments. It takes time for society to accept women as technicians in these fields. In addition to these attempts it is necessary to campaign for the recognition of existing skills.

Training in technical skills could be combined with other educational programmes so that "if workers lose their jobs, they have acquired something of permanence —more self-confidence, more organisational and advocacy skills, more knowledge of how their society works" [Elson 1992].

Lack of credit facilities will affect women workers especially the self-employed. Banks will have to be pressured to respond to the poor sections of society. At the same time we have to assist women to gain access to family resources by insisting on joint ownership of land and house, including their names in identity cards, photopasses and ration cards. This could help in gaining access to formal credit sources.

Women in bastis often invest their savings in chit or rotating funds. Community organisations, unions, women's organisations can play a role in seeing that women are not cheated by monitoring these schemes or setting up their own saving schemes.

All these strategies require collective action at different levels pressurising the state, supporting working women in their daily survival and developing organisational forms which can empower them within the household, in the market and in relation to the state. A number of voluntary organisations have started programmes on health and provision of services like fodder, banks, credit, etc, given the deteriorating economic situation. While supportive programmes are necessary, these should not become a reason for the state to abdicate its responsibility to provide these services to its citizens. On the other hand, the NEP should be opposed along with presenting alternatives. A double-edged strategy needs to be followed which combines supportive strategies with organised pressure on the government to ensure that the poor do not pay even more for a crisis which was not of their making.

Notes

[An earlier version of this paper was presented at Sixth National Conference of Indian Association of Women's Studies at Mysore, May 31-June 3, 1993.]

1 The income tax exemption for women with an annual income of Rs 36,000 in the 1991-92 budget was presented as a major concession to working women. This would benefit a minor section of all working women, the majority (98 per cent) of whom work in the unorganised sector.

2 Karamat Ali, Pakistan Institute for Labour Education and Research, Personal Communication.

3 Interview, November 23, 1993 from the authors' ongoing research project on 'Working Women and Organisational Strategies in India'.

4 The only area where it can be definitely stated that such a process of feminisation has occurred is in primary school teaching profession. Women form 70-80 per cent of the teaching force and men by and large avoid such employment. Again given possible cuts in the social sector including education, which has been part of SAP in other countries, this area of employment could also be hit.

5 After examining evidence on labour markets in the context of SAP in 12 countries Horton, Kanbur and Mazumdar point out: "... in response to structural adjustment, labour has moved in the direction opposite to that usually associated with economic development. It has shifted back into agriculture, out of manufacturing and out of the public sector (although one might argue that the latter sector was too large, given the level of development reached). Recession plus adjustment have also resulted in an increase in informalisation, greater use of casual labour, decreased worker benefits, and declines in wage differentials for skill and possibly for education. These trends are observed even in the most successful adjustment cases in Asia." Developing countries have long resisted being relegated to the role of primary producers in the international economic order and it is

unlikely that structural adjustment which relies on a shift of labour into agriculture is going to be sustainable for long [Horton Kanbur Mazumdar 1991]

Textiles: A Study in Intervention

Tirthankar Roy

India's Textile Sector: A Policy Analysis by Sanjiv Misra; Sage Publications, New Delhi, 1993; pp 278, Rs 275.

ROUGHLY between 1956 and 1985, the textile industry in India was governed by a closely regulatory regime. The state intervened on mainly two fronts: competition among mills, powerlooms and handlooms; and consumer preference between cotton and non-cotton fibres. Competition was regulated by restriction on the mills and excise duties. Fibre-choice was directed by tariffs and taxes on non-cotton. This framework began to be dismantled from 1985 on realisation that interventions had been partly frustrated and partly damaging. Restriction on the mills was meant to protect handloom weavers, and thus several million jobs, but it resulted in a clandestine expansion of small-scale powerlooms. The demand for non-cotton grew despite high taxes. And in the course of the three decades, India, the premier textile manufacturer in the developing world in 1940, accumulated sickness in the cotton mills, and steadily retreated in the world market.

In official and scholarly writings on textile policy, elements of this experience have been discussed, specially the problems of sickness, demand and fibre-choice and sectoral market-shares. But comprehensive reviews, that describe the entire range of policies and assess their effects, have been rare. The book by Sanjiv Misra addresses that need. As a survey it is quite thorough, and will serve well the specialist as well as the lay reader. Further, the chapter on policy options is worth serious consideration from anyone interested in reforms.

The main weakness of the book, however, is that it defines its concerns essentially by the existing scholarly discourse, and insufficiently by changes in the industry itself. Being a rather derived study, wherever data are absent and opinions impressionistic, the book absorbs the limitations of the literature. It is also unhelpful in understanding the textile scenario that is evolving now, out of a partial wihdrawal of the government and expanded markets at home and abroad

A brief summary of the ground covered is in order. Per capita cloth consumption in India in metres stagnated from the late-1970s, but there was substitution of cotton by synthetics. The book stresses the durability of non-cotton among the factors that can explain the substitution as well as the stagnation in cotton cloth consumption. Fibre-choice is related to the issue of sectoral competition, for the three sectors specialised by fibre. In general, powerlooms specialise in synthetics and medium-fine counts of cotton; the mills in blended cloth and coarse-medium counts; and the handlooms belong at two ends, very coarse and finer counts. They are, however, dominant in fibres like the natural silks, which the book does not consider. Is the observed specialisation an outcome of comparative advantages? The usual answer to this question rests on relative labour and yarn costs; the mills pay better wages, but save on cotton yarn which they make. The book, however, argues that it is unequal excise duties that makes the crucial difference between mills and powerlooms.

Capacity-restriction, fiscal discrimination and fibre-preferences abetted sickness and idle capacity in the mills, which persisted because exit is costly. Interestingly, despite these problems, India remained a relatively low-cost producer of textiles in the world market; she lost out in exports probably due to misaligned exchange rates, and quality-differences. In an informative chapter, the book describes the impact of policy on fibre supply and fibre-choice: the distortions implied by an effective ban on cotton exports, by state dominance in the cotton market, and the growth of a relatively inefficient domestic manufacturing industry in man-mades under high tariffs. Incidentally, an important component of the industry, the pure spinning mills, receives rather scarce mention. The chapter on policy is largely anticipated by the description that precedes it. A deregulation process is already under way: still, many areas of reform need to be addressed, on which the chapter can be insightful.

But deregulation also underscores the fact that the industry will in future be subject to a dynamics in which the government plays a marginal role. It is important to understand this dynamics to avoid a too state-centric interpretation of developments and because policy-options will have to be sensitive to these endogenous changes. This issue, surprisingly, does not concern the book at all. We are told of myriad distortions but not of the sources of growth in the late-1980s or its implications.

Two examples will illustrate this point. First, obsolescence and slow pace of modernisation in the mills have been addressed in academic writings of the early-1980s. But the rate of modernisation has increased quite remarkably, though unevenly, across segments in recent years And as always, the mills include a score or so that are among the best-equipped in the world.

Perhaps there is more to investment decisions and strategies than restrictive or liberal regimes. Secondly, the role of handlooms in the new regime needs an explicit statement.

On handloom weaving, the book has little to offer beyond impressions and sterile debates. This is not entirely the author's fault, but of the literature he surveys, though greater care was needed in stating the issues. Since the 1950s, benefit-cost comparisons between types of loom (in fact, there are more studies in this class than the author cites) have yielded the scarcely earth-shaking result that for comparable cloth, handlooms can be profitable only at unrealistically high interest rates or low wages. In the face of such 'severe productivity handicaps', the 'unexpectedly slow decline' of handlooms is attributed by the author to state munificence and product-differentiation between sectors. Now, which is the primary reason for continuance, policies or specialisation? This is the crucial issue, for it shows precisely on what ground policies can be evaluated and how they could be reformed. If it is the former, it is sensible to acknowledge that very high fiscal and efficiency costs may be involved in protecting handlooms. But if it is specialisation, then apart from the fact that the benefit-cost comparisons stop making sense, the appropriate critique of policies becomes an open question. We can no longer believe that the state has no business with the handlooms other than humanitarian, but what should the involvement be?

The real contradiction, in my view, is that handlooms have been consistently seen as generation of employment rather than as a repository of specific skills. This is odd since the weavers do have an advantage in certain techniques of pattern-making. And this is ahistorical since it is precisely these skills that made India the origin of some of the most spectacular cloth the world has ever seen. As a result of the emphasis on number of people employed, quality and innovation have been de-emphasised, and handloom survival has been achieved at the cost of a certain de-skilling or at the cost of an erosion in their comparative advantage. The government has managed to save a lot of handlooms by making them intrinsically dependent on its aid.

A sensible policy must shift from protecting employment *per se*, toward salability, at home or abroad. There is no reason why export-optimism, or any other goal, must be inconsistent with preservation and utilisation of artisan techniques. Nor is there any a priori reason to believe that a policy determined to achieve the latter will be unduly costly. On the contrary, it is a plain truth that the image of Indian cloth, of having centuries-long practice at blending aesthetics with everyday-use, will survive just as long as the weavers do. To sustain the historical reputation of Indian artisan wares makes plain business sense.

To return to the book, it will indeed prove useful as a sort of reference, and as a survey of the literature on textile policy analysis. But events and issues in textiles may well be overtaking this literature. It is, therefore, a pity that the author let himself be guided too closely by the latter.

Transition from Stabilisation to Growth

Hiranya Mukhopadhyay

Economic Stabilisation and Debt in Developing Countries by Richard N Cooper; The MIT Press, Cambridge, Massachusetts, 1992.

THE book under review is an expanded version of two lectures given by Richard N Cooper in Stockholm in September 1988. One lecture was addressed to a lay audience, the other to a group of economists. Therefore many analytical and mind-boggling issues concerning stabilisation and debt problems are discussed in this book in a language that could be understood by everyone.

The first and third chapters of the book draw heavily on results from a study conducted by the World Bank to examine how developing countries coped with the first and second oil shocks and the debt crisis (partially attributed to the sharp downturn in the world economy during 1979-81). Furthermore, the author offers some lessons for successful stabilisation in chapter three which are based on the experience of 18 developing countries (including India). Chapter two presents the analytics of the standard disabsorption approach, popularly known as the 'expenditure reducing' policies. However, the orthodox cure is necessary but not sufficient for stabilising a major inflation which may be due to inflation inertia [see for example, Bruno 1993 and Dornbusch 1993]. The combined stabilisation and adjustment policies in Mexico in December 1982 corrected external disequilibrium to some extent but failed to contain inflation (it may be noted, Mexico is included in the sample of 18 developing countries). The author pays little attention to this issue in chapter two. Finally chapters four and five deal with the origins of the debt problem and suggest how this problem is likely to be resolved. Since it is not possible to go into details of the various aspects covered, I shall touch only on some selected aspects.

The discussion in chapter three mainly revolves around five important findings: (i) no correlation between the size of the external shocks and economic performance during the 1980s, (ii) statistically insignificant correlation between inflation and growth during the 1980s, (iii) countries with sharp disabsorption between 1978 and 1983 performed poorly, (iv) a stable real exchange rate is found to be essential for better performance, and (v) budget discipline not budget deficits as such is an important indicator of performance.

Let us discuss some of these findings in detail. The author cites two examples to support his first finding. Korea and Sri Lanka had large negative shocks but performed relatively better during 1980s while Nigeria and Mexico failed despite positive shocks. These examples indeed suggest a negative correlation between shocks and growth because a large negative shock might induce the country to undertake adjustment programmes. Corbo and Rojas (1992) report that structural adjustment programmes helped many intensive adjustment lending countries to perform better than the non-adjustment lending countries during the late 80s.

The crucial issue of trade-off between inflation and growth is another important aspect. The author's finding that inflation cannot explain the disparity in growth performance may be attributed to the weakness of cross-section analysis. Many countries for one reason or another might have encountered one of the four alternative possibilities in the growth-inflation frontier during the 80s. These possibilities are as follows:

(1) High inflation and high growth due to monetary expansion to ride out the storm (Brazil during the early 1980s). However, this cannot succeed in the long run due to distortions caused by high inflation [Bruno 1993].
(2) Low inflation and low growth due to the adoption of expenditure reducing policies. It is widely believed that revival of growth after stabilisation is delayed in many countries because the authorities are unwilling to attempt expansionary policies for fear of inflation. Breaking this impasse was the main task faced by the Salinas administration in Mexico in December 1988 [Lustig 1993].
(3) Low inflation and high growth caused by successful micro reforms (Korea during the 80s).
(4) High inflation and low growth, which may be the result of debt crisis and failed stabilisation programmes (Argentina during 1980-1990).

Therefore, insignificant correlation between inflation and growth across countries at a particular point of time does not necessarily imply the absence of relationship in a particular country of the sample over time. The causal link between inflation and growth is essentially a dynamic process, cross-section analysis may not reveal the true scenario.

This brings us to the most debated issue in literature, namely, the transition from stabilisation to growth. This issue is closely related to the third finding mentioned above. Hyperinflation may be cured with the help of massive disabsorption but is there any guarantee that growth will revive soon? The answer is no. Another interesting finding of the book might shed some light in this direction. Growth over the 1980s is found to be significantly (negatively) related to the annual variation in growth rates. Therefore, the author rightly conjectures that stable growth seems to be conducive to higher growth. This result, in my opinion, can be explained in the following way. Slow recovery in the growth rate in many countries may be attributed to slow recovery in private investment. Two important determinants of private investment are (i) stable output growth, and (ii) uncertainty factors in investment decisions. Investors are often reluctant to make fixed investment when they are uncertain about the future or they believe that the programme is not credible. Perhaps stable growth also boosts the credibility of the stabilisation programme and reduces future uncertainties. Nevertheless, the relevance of credibility should take the centre place in any discussion which seeks to analyse the transition from stabilisation to growth. Lack of credibility is held responsible for the failure of stabilisation programmes (especially exchange rate based stabilisation programmes) in Mexico, Argentina, Chile and Israel [Kiguel and Liviatan 1992].

Finally, Cooper suggests some solutions to the debt crisis. Some of them are highly innovative and practical. For example, the suggestion that the IMF can sell off a portion of its gold holdings to help poor countries with new low-interest loans or to subsidise interest rates on other advances to poor countries is very realistic.

On the whole, this book is very useful and an example of a well-written document. The book ought to be read by the students and all those who have something to do with adjustment policy formulation.

Communication and Development

Dipankar Sinha

Perspectives on Development Communication edited by K Sadanandan Nair and Shirley A White; Sage Publications, New Delhi, 1993; pp 256, Rs 250.

BOTH as a field of research and an area of activity, development communication has a dynamic core because it integrates two fundamentally important issues in human civilisation—development and communication—and their problems and prospects. There seems to be no end to the ongoing debate on the notion of development and the process of communication. As C A O Van Nieuwenhuije puts it in *Development Begins at Home: Problems and Prospects of the Sociology of Development*, development is like motherhood—everybody is in favour; but after years of wear and tear the notion is, for all practical purposes, variable. A major reason for this is that development, first and foremost, is concerned with the people—their emancipation and empowerment. On the other hand, communication as a process that disseminates data, information and knowledge has an indispensable role in promoting development in whatever form. The problem, however, is that the essential linkage between development and communication has not always been used to serve the interests of the people. 'Top-down communication' approach, based as it is overwhelmingly on the west-centric ideas, concepts and practice, often results in perpetuation of underdevelopment or stunted development with people, in both the cases, being forced to act as 'passive and apathetic' clientele.

There is still the other side of the coin. While it has long been realised by researchers and practitioners of development communication that the dominant development paradigm to which various development and communication strategies and approaches are tied would never bring transformation in the lives of the marginalised millions in the third world, the alternative strategies and approaches are yet to prove their transformational potential. With its root in neo-classical economic foundation, the dominant development paradigm propagates a trickle-down approach which, as we know, makes popular initiative and participation almost non-existent. But why is it that despite an impressive output of alternative literature in development the plight of the third world continues? No wonder then that the scholars of development communication need to conduct introspection in order to devise more effective ways and means to promote equitable, participatory and indigenous communication for development of the same kind. The book under review reflects a collective endeavour to confront the problems and provide solutions.

In 'Perspectives and Paradigms'—Part I of the book—Everett M Rogers in his contribution 'Perspectives on Development Communication' provides a historical overview of the dominant paradigm—its origin and nature—and the fundamental elements of what he calls 'alternative pathways to development'. Rogers, however, does not provide any in-depth analysis of the 'alternative pathways'. Rogers mentions that the realisation which dawned in the 70s in several third world countries that the dominant paradigm had failed to deliver the goods offered much scope to the advocates of alternative development. True, but the need of the hour is to explain why are the same states absolutely convinced today that the road to development lies through the west. Nair and White, however, can take credit for briefing us on the growing demands of alternative communication theory formulation as part of development strategy in the 90s. Their elaboration of the transactional model of development communication attempts to facilitate a paradigm shift by incorporating the concepts of community participation, socio-cultural change, decision-making, enabling (or enablement), grass roots participation and empowerment.

Some papers in this section contain a passionate plea for reorienting development and communication approaches in the context of non-western (and specifically Indian) societies. Indira Rothermund, for instance, argues in favour of imparting Indianness (read Gandhianness) to the discourse of development communication. In her paper, Rothermund shows how Gandhi became an effective communicator by using "reformulated religious and cultural idioms that were an integral part

of the Indian tradition for mass communication" (p 81). Rothermund's essay is brief but very interesting. Most of the works on Gandhi have him as 'the greatest mass leader' as their point of departure. With certain exceptions like Judith Brown, Yoginder Singh, John Fiske, and Rothermund herself in her other writings, few would venture to analyse Gandhi as a communicator. Rothermund illuminates us on how the Gandhian way of 'message design' based on traditional idioms, folk culture, symbols and indigenous terms led to the Gandhian model of development. The model, in fact, incorporates many of the fundamental concepts of alternative paradigm—popular initiative, popular participation, indigenous knowledge, cultural identity and dignity of human values.

In Part II which deals with 'Issues, Approaches, and Strategies', the focus is on the context-specific discussion on development communication. Yadava's paper maps the media scene in India to assert that "the mass media can hardly be an effective source of information for those who are living below the poverty line" (p 112). Blaming consumerism and escapism as values dominating the Indian mass media, Yadava laments that the opportunity to widen the base of informed and skilled people for participatory and balanced development is being missed by us. Focusing on rural India, S Seetharama traces the failure to communicate with rural masses in abundance of information flow, varying quality of information, lack of current information, unreliable information-dissemination agencies and lack of co-ordination and communication among information source-agencies. Conceiving media bureaucracy as an important segment of development infrastructure, Uma Narula develops a conceptual model of development communication as part of the need to conceptualise a perspective for a future media bureaucracy. This, Narula argues, has to be integrated with development of an orientation of a future development bureaucracy to a specific development approach in order to uplift the quality of life for the masses.

A large share of the introspective studies on development communication pertains to exploration of more appropriate and effective message-design and media dissemination. 'Message, Media and New Technology'—Part III of the book—has the main focus on the need to examine the origins of message-making and to explore the interface of traditional and modern media. D P Pattanayak extends his observations on television as a rural communication medium to conclude that the failure of modern technology to reduce 'information-deprivation' of the message-hungry masses ultimately leads to some significant questions: who designs messages? who has access? who participates? who controls and who communicates? how can cultural and linguistic diversity be accommodated and protected despite use of modern technology? D K Sujan seems to have provided an answer to Pattanayak's last question in visualising a judicious integration of traditional folk media—puppetry, 'lila', 'harikatha', folk songs, 'nautankis' and 'gatha'—and modern media to communicate development messages by 'utilising' language and cultural tradition. For V K Dubey and S K Bhanja the need is to demystify media use at the small community level for motivating people to identify their problems and find solutions realistically. Contractor, Singhal and Rogers, in their very informative paper, mention various perspective on technology-society interface to discuss how certain contingency factors—organisation, communication hardware, infrastructural development, audience research, to mention some—mediate the impact of satellite television in rural development in India. The paper assumes greater significance in view of the contemporary debate on the role and impact of satellite television in India.

The collection of papers in the book widens, to a significant extent, our perspective on the theory and practice of development communication. The papers reflect the sincerity of the contributors who, learning from their experience, advocate new ideas and approaches. However, a major limitation of the book is that it does not provide adequate attention to evaluation of existing political arrangements. Understanding of development and development communication definitely needs a thorough discussion on technical and technological issues but it should not be overemphasised. Is there any ground to assume that technological advancement necessarily leads to diffusion of power? Examples abound in today's world which show that advancement in modern technology leads to more and more control, both physical and mental, and less towards social and economic transformation. In empha-sising the essential role of communication as an instrument of building a durable and integrative national bond, attitudinal and motivational infrastructure and the milieu of change and progress, the advocates of development communication, in this book as well, ignore the international/transnational dimensions of communication. While a number of contributors in the book refer to the internal dimensions of the power-equations, their treatment of them remains either tangential or incomplete. The task of constructing an alternative paradigm of development is primarily political because it needs an 'offensive' against the statist approach of the power-brokers. If the advocates of equitable and participatory development feel shy of such confrontation, the paradigmatic surrender would continue. And obviously, there would be no change in the state of affairs created by those who control the affairs of the state.

Utilisation of Health Services in India

Brijesh C Purohit
Tasleem A Siddiqui

The pattern of utilisation in our country had some desirable outcomes, namely, growing popularity of indigenous non-allopathic systems and growth in private sector's involvement in expensive tertiary care As against the National Health Policy guidelines the regional disparities in health service utilisation among different expenditure groups of states as well as rural-urban disparities tend to continue Further in spite of inadequacy of health services and prevalence of inequality in utilisation, there has been no serious governmental initiative to encourage appropriate utilisation by means of devising health insurance and other cost recovery mechanisms

I
Introduction

THE earliest attempt at emphasising adequate utilisation of health services was made in the report of Bhore Committee (1946) The committee prescribed norms pertaining to staff, availability of per capita beds, and other norms pertinent for dispensaries and hospitals having different bed sizes Different committees over the years also pointed out the factors that affected utilisation of health services Those included among the former were lack of co-ordination of hospital services, close proximity of out-patient department with the hospital proper, skewed distribution of trained personnel in favour of urban areas, and wastage of time of highly trained medical professionals in routine duties that could be done by lesser qualified personnel [Bhore Committee 1946, Srivastava Committee 1975] In recent years the document on National Health Policy (1983) published in the wake of Alma Ata declaration, chalked out 17 specific goals to be achieved The policy also suggested a number of guidelines for reforming and improving efficiency of existing health services in the country Some of the guidelines are pertinent for the utilisation of health services The relevance of these guidelines emerge prominently, however, through their emphasis on such aspects as (a) dispersal of network of comprehensive primary health care services, (b) decentralisation of services through well worked-out referral system, (c) appropriate location of curative centres in terms of topography, density of population, distances and transport connections, (d) attainment of maximum utilisation of health facilities by means of avoiding duplication of facilities, and (e) devising different mechanisms in regard to repair, maintenance and proper upkeep of all bio-medical equipment The policy thrust on these aspects aims at highlighting the significant role that the appropriate and adequate utilisation of health services and facilities could play in achieving the policy objectives The emphasis in policy, however, assumes concentration of curative facilities and consequent lower utilisation in certain areas as well as an existence of inadequacy of them in some other areas

Attempts at exploring utilisation aspect of health services in India have been largely limited to micro level studies While there have looked into various aspects, namely, distance of facility from patients, type of care, availability of facility, cost of treatment, quality of care, awareness about existing facilities, as well as other socio-economic aspects of patients in a particular regional set up, owing to the micro nature of such studies it is not possible to get an overall picture at either state, regional or national level [Yesudian 1980, 1988, Khan and Prasad 1988, Duggal and Amin 1988, Purohit et al 1992] In this regard recently two macro level surveys have provided a good information base pertaining to various aspects of health services in the country [NSSO 1992, NCAER 1992] A detailed analysis of this newly-available data base could help us to explore the present status in health service utilisation

The present study aims at analysing the available information bases to have closer look at utilisation aspect of health services in our country and derive their relevance for existing national health policy The degree of utilisation is established in this study in terms of relative levels of health facility utilisation across the states

The study is divided into nine sections The next section looks at the all-India scenario This is followed by comparison of Indian states by classifying them in terms of low, medium and high expenditure groups. Section IV deals with a comparative profile of public and private facilities across the

TABLE 1(a) PERCENTAGE DISTRIBUTION OF TREATMENTS OVER SYSTEM OF MEDICINE (NSSO 1986 87)

Allopathic	Homeopathic	Ayurvedic	Unani/Hakimi	Any Combination of These	Others	
Not as In patients						
95 91	1 78	1 53	0 27	0 07	0 44	Rural

Indian states. The reasons for untreated spells, education and caste factors have been discussed in Section V. Insurance status and cost of treatment comprise Section VI. The next section contains the estimates of states and households expenditure on health care. Inequality in utilisation forms the focus in Section VIII. The conclusions comprise the final section.

II
All-India Scenario

As pointed out earlier, two major sources which providing the macro picture are the National Sample Survey Organisation (NSSO) and National Council of Applied Economic Research (NCAER). An exhaustive survey conducted by the former between July 1986 and June 1987 (NSSO, 43rd Round) provides information about various aspects of health service utilisation in India. Coverage of NSSO sample extends over 8,346 villages in rural areas and 4,568 blocks in urban areas [*Sarvekshana* 1992]. The latter's surveys conducted between May 1990 and July 1990 also covered similar aspects over the entire geographical area of the country. The sample encompassed 1,061 villages and 1,873 blocks in rural and urban areas respectively [NCAER 1992]. Though its sample coverage in comparison to NSSO survey is much less in terms of the number of villages and blocks, it provides a representative picture available for the later year, that is, 1990.

The NSSO survey distinguished its respondents between hospitalised cases and 'not as an in-patient' category. The survey revealed a dominant preference for allopathic system both in rural and urban areas. Around 96 per cent of treatment (not as an in-patient) undertaken was allopathic in rural as well as urban areas. Among hospitalised cases, the corresponding percentages remained around 98 per cent in both the areas. Indian systems of medicine were found to have been utilised at a very low level. Thus, among non-hospitalised cases, homeopathic system (around 2 per cent) generally remained the next important system. The same is true, however, with respect to ayurvedic system (around 0.50 per cent) pertaining to hospitalised cases (Table 1(a)).

Viewed in terms of types of hospitals, maximum number of in-patient respondents were observed to avail public hospital facilities. The former in rural and urban areas remained around 55 and 59 per cent respectively. In this regard, private hospitals as health care providers appear next in importance with their 32 per cent and 29 per cent of total hospitalised cases respectively from rural and urban areas. The situation with regard to treatment by source in non-hospitalised cases reveals higher utilisation of services of private doctors. It remained around 53 per cent and 52 per cent in rural and urban areas. This is followed by treatment at public and private hospitals in both areas (Table 1(a)).

It is pertinent to note that nearly 54 per cent respondents in rural areas and 57 per cent respondents in urban areas availed OPD care without any payment. Respondents who paid for services availed health care more in the private sector. As such, nearly 34 per cent of respondents in rural areas and 32 per cent of respondents in urban areas paid for health care in the private sector (Table 1(b)). Even in hospitalised cases, nearly 29 and 32 per cent of respondents in rural and urban areas respectively availed health services without payment. However, the wardwise break-up shows that utilisation of free wards was more (61 per cent) among rural respondents (Table 1(c)). Further, among the sick respondents who could not be treated a larger percentage (18.46 per cent) in rural areas cited the cause (for no treatment) as either non-availability of medical facilities, financial reasons or a long waiting period (Table 1(d)). The corresponding percentage of respondents with either of these reasons remained around 11 per cent in urban areas (Table 1(d)). Considering the average amount of payment made to a hospital, it is generally observed that health facilities in rural areas were cheaper. In fact, respondents availing health care in government hospitals in rural areas paid less (Rs 320) than their counterparts in urban areas (Rs 385). However, care in private hospitals remained more expensive than government hospitals both in rural and urban areas although private hospitals in rural areas were less expensive than their urban counterparts. In comparison to payment in government hospitals the rural respondents paid two and half times more in private hospitals. In contrast, respondents in urban areas paid correspondingly almost four times more in private hospitals (Table 1(e)). Further, taking into consideration factors like average duration of sickness treated and average number of days stayed in the hospital, a comparison of corresponding total expenditures depict the rural areas as generally cheaper than their urban counterparts (Table 1(f) and 1(g)).

Some of the trends in utilisation of health care seem to have undergone change be-

TABLE 1(e): AVERAGE PAYMENT MADE TO HOSPITAL BY TYPE OF HOSPITAL—RURAL AND URBAN SECTORS (NSSO, 1990)

Government	Private	All	
320.34	733 38	597 06	Rural
385 02	1206 01	933 33	Urban

Average Number of Days Stayed in the Hospital	Average Total Expenditure (Rs) for Hospital Treatment	
15.5	853 23	Rural
15 2	1182.95	Urban

TABLE 1(c): PERCENTAGE DISTRIBUTION OF TREATMENTS OVER PAYMENT CATEGORY, (NSSO, 1986-87)

No Payment	Under Employers Medical Welfare Scheme	Reporting Payment to: Government	Private	All	
Not as an In-patient:					
49 14	5 21	12.42	33 23	45.65	Rural
42 26	13.74	12.65	31 35	44.00	Urban
No Payment	**Under Employers Medical Welfare Scheme**	**Reporting Payment to Institution**			
Hospitalised Cases:					
23 16	6 18	70 66			Rural
19 61	12.95	67 44			Urban
Free	**Paying General**	**Paying Special**			
Hospitalised Cases					
60 71	32.46	6.83			Rural
55 22	31.79	12.99			Urban

TABLE 1(d): PERCENTAGE DISTRIBUTION OF UNTREATED SPELLS OF SICKNESS OVER REASON FOR TAKING NO TREATMENT (NSSO, 1986-87)

No Medical Facility	Lack of Faith in the System of Medicine	Long Waiting	Financial Reasons	Ailment Not Considered Serious	Other Reasons	
2 86	1 93	0 33	15 27	74.61	5.00	Rural
0 13	1 81	1.05	9 57	81.13	6.31	Urban

tween 1986 and 1990. As a result, some of the above observations get partially modified in the light of the later survey [NCAER 1990]. One notable feature, for instance, revealed through the NCAER survey is a slightly increased preference for the homeopathy system Treatment through the latter per illness episode (unlike the NSSO survey) has gone up to around 13 and 11 per cent in rural and urban areas respectively (Table 2(a)) Likewise an increase in preference for ayurvedic system is also noticeable from the later survey The growing popularity in these two systems has thus brought down the use of allopathic system to around 75 and 80 per cent in rural and urban areas respectively (Table 2(a))

Further, over the years there has been noticeable increase in use of facilities at private hospitals as well as medical shops The percentage of those availing facilities at public hospitals has fallen with commensurate increase in the percentage use of private hospitals per illness episode up to 43 and 44 per cent in rural and urban areas respectively (Table 2(b)) Similarly the use of medical shops as a source of treatment has been observed at higher levels and remains as around 11 and 14 per cent in rural and urban areas respectively Keeping partly in line with this trend, there has been an increase though proportionately lesser in magnitude in availing treatment from private doctors The latter has risen by 2 and 3 per cent respectively in rural and urban areas (Table 2(b))

Another interesting aspect comparable between the two survey periods relates to average cost of treatment per illness episode The latter as depicted by NCAER survey is very low and remained around one fourth of comparable figure from NSSO survey Thus, NCAER's corresponding figures for rural and urban areas are around Rs 152 and Rs 143 respectively These figures, in fact, depict very low rural urban differential and in this regard remain in sharp contrast with the earlier survey

III
State Level Differentials in Utilisation

The all-India averages as discussed above tend not to reflect variations across states Thus in order to look into state level differentials we presumed that the state level expenditure on health care will be a prominent factor in determining the availability of these facilities The level of utilisation in turn, is likely to differ significantly across states depending upon the availability of facilities and services Bearing this fact in mind we classified Indian states according to their per capita state expenditure on health The latest available estimates namely, for the year 1990-91, in this regard suggest an

TABLE 1(B) AVERAGE DURATION OF TREATED SICKNESS AND AVERAGE TOTAL EXPENDITURE PER TREATMENT BY SOURCE OF TREATMENT RURAL AND URBAN

all-India average per capita expenditure on health as Rs 116.52 [Reddy 1992]. We, therefore, adopted this expenditure estimate as our basis for classifying states into three groups.

All those states with a per capita health expenditure less than all-India average (i e, Rs 116.52) were considered among low expenditure group. The states with a per capita health expenditure equal to or more than the all-India average but less than Rs 200 per capita were considered to be in the medium expenditure group. The high expenditure states, each with health expenditure more than Rs 200 per capita, comprised the third group. Following this classification, there were as many as 12 states in low expenditure category. This included Andhra Pradesh, Assam, Bihar, Gujarat, Karnataka, Madhya Pradesh, Maharashtra, Orissa, Punjab, Rajasthan, Uttar Pradesh and West Bengal. The other groups, namely, medium expenditure states and high expenditure states comprised of respectively three and two states. Haryana, Kerala and Tamil Nadu fell in the medium expenditure category and Himachal Pradesh and Jammu and Kashmir remained among the high expenditure group.

OPD and In-Patient Utilisation

The information available across three groups of states, namely, low, medium and high expenditure groups suggests that percentage of population which utilised any of the health facilities at OPD remained the highest (92.23 per cent) in rural areas for the high expenditure group of states. In case of urban areas, the medium expenditure group of states was observed to be having the highest OPD percentages (89.82 per cent).

In a similar way, the medium expenditure group of states, both in rural and urban areas, depicted the highest number of hospitalised cases.

An interesting observation emerging from the information across three groups of states is that the highest percentage of OPD utilisation were observed utilising the services of private doctors. This holds true for rural as well as urban areas. For instance, as many as 47 per cent of respondents in rural areas among the low expenditure states availed services of private doctors, which is higher than the comparable rates in either medium expenditure (46 per cent) or high expenditure states (42 per cent).[1] Public hospitals, in this regard, occupy second place. A glance at the OPD rates suggests that in rural areas these rates in public hospitals are considerably higher for high expenditure states. In fact, percentage OPD availing public hospitals in rural areas is much higher in the latter (34 per cent) than the low expenditure group of states (19 per cent). A similar situation also prevailed in regard to the urban areas. Further, with exception of high expenditure states, OPD attendance in public hospitals remained higher in urban areas than their rural counterparts.

The third prominent place in terms of OPD utilisation is occupied by private hospitals. The highest rates (around 19 per cent) both in rural as well as urban areas, in this regard, are observed among the medium expenditure states. The percentage of OPD coverage through all other sources including primary health centres (PHCs), public dispensaries, nursing homes, charitable institutions, ESI doctors, and others remained in rural areas between 11 per cent (for medium expenditure states) and 20 per cent (for low expenditure states). Likewise, OPD coverage through all these above mentioned sources in urban areas, though much lower than their rural counterparts, remained between 8 per cent (low expenditure group) and 14 per cent (high expenditure group).

A comparative view of the states pertaining to hospitalised cases distinguished by type of hospitals suggests some noteworthy patterns of utilisation. It is, for instance, observed that the highest utilisation of public hospitals is made in the states belonging to high expenditure group. In rural and urban areas, rates for these states remained as 81.38 per cent and 87.36 per cent respectively. Further, with the exception of medium expenditure states, utilisation of public hospitals in terms of in-patients percentage was higher generally in urban areas.

Corresponding inversely to the state government's low average per capita ex-

penditure levels, the private rural hospitals were used more by respondents (27 10 per cent) among the low expenditure group of states. In urban areas a similar correspondence is not clearly observed, even though the highest expenditure group of states depicts the lowest use of private hospitals' inpatient facilities (9 32 per cent)

Further, the utilisation of PHCs (both in rural and urban areas) is observed to be the highest among the high expenditure group of states In contrast charitable institutions played a relatively more prominent role among low expenditure states The in patients who availed of such institutions in these states in rural and urban areas were estimated as 1 98 and 2 10 per cent respectively The same is true in urban areas in regard to nursing homes The percentage of in patients among the low expenditure states in urban areas thus remained as 6 90 per cent In a manner akin to private hospitals even the use of nursing homes and other types of hospitals with in patient facilities is observed more prominent in the group of states with low governmental expenditures

Disaggregation in terms of free vs paid wards suggests that in patient services were being utilised free of payment comparatively more among the high expenditure group of states (Table 3) As many as 91 25 per cent and 85 81 per cent of respondents, in rural and urban areas respectively, availed of health care in free wards in this group of states The lowest percentage in rural areas (60 48 per cent) were observed corresponding to the low expenditure states In urban areas, however the lowest number of respondents (52 41 per cent) hailed from the medium expenditure states, who availed in-patient care in free wards

Further disaggregation in terms of public, private, and other types of hospitals, reveals that more in patients at public hospitals, rural as well urban, had availed of free ward facilities In this regard, there is observed a correspondence with governmental expenditure levels Thus, urban respondents in high expenditure states (92 68 per cent) exceeded the comparable percentage in other groups of states Similar correspondence between high government expenditure levels and higher utilisation of free wards, even in private hospitals, PHCs, charitable institutions and nursing homes is also observed (Table 3) Except the rural public hospitals, this pattern holds true both for rural and urban areas Pertaining to free wards, with few exceptions, generally larger percentage of rural and urban respondents in lower expenditure states, availed of paying general wards in these categories of health institutions (Table 3) With regard to paying special wards, however, no such pattern is discernible (Table 3)

IV
Government vs Private Facilities

It is pertinent to observe the pattern emerging through a break-up of OPD as well as in patients across five types of facilities, namely, medicines, X-Ray/ECG/EEG, 'any other diagnostic treatment', surgical treatment and 'any other treatment' (Tables 4 and 5) With medicines being an exception, all-India ratios of government to private facilities in rural areas through all payment categories remained around 1 3 The corresponding ratios in urban areas were simi-

TABLE 6 PERCENTAGE DISTRIBUTION OF HOSPITALISED CASES OVER PAYMENT CATEGORIES FOR RURAL AND URBAN SECTOR

(*Per Cent*)

State Groups	Rural Payment Category: No Payment	Rural: Employers Medical Welfare Scheme	Rural: Reporting Payment to Institution	Rural: All	Urban Payment Category: No Payment	Urban: Employers Medical Welfare Scheme	Urban: Reporting Payment to Institution	Urban: All
Low expenditure group	23 35	6 17	70 48	100 00	19 58	13 83	66 59	100 00
Medium expenditure group	24 98	3 27	71 75	100 00	21 03	8 30	70 67	100 00
High expenditure group	32 75	8 33	58 92	100 00	26 82	12 76	60 42	100 00

larly observed around 1 2 7 The comparable ratios for in-patient care both in rural and urban areas were estimated to be in vicinity of 1 0 7 The pattern is thus suggestive of overall wider spread of private sector in providing OPD care

However, ratio of government to private services does not remain invariant across states In fact, variations in these ratios denote more involvement of government associated with rising levels of per capita state expenditure In rural areas, for instance, ratio of government to private facilities pertaining to different types of OPD facilities were estimated for low expenditure states as around 1 3 (Table 4) Whereas the estimates for other groups of states were respectively around 1 2 (medium expenditure group) and 1 0 70 high expenditure group) (Table 4)

Analogous estimates for urban areas connote decline in health care provision from private sector in groups with higher per capita state health expenditure (Table 4)

Higher levels of government expenditure further seems to be associated with more of free public faciltties being utilised both in rural and urban areas As a result it is consistently observed that lower quantums of free private health facilities have been utilised among higher expenditure states (Table 4) With certain exceptions, like other diagnostic facilities and any other treatments (both in rural areas) and medicines (in urban areas), this pattern holds true for all of above mentioned five categories of facilities (Table 4)

Utilisation of private sector's health facilities has been, however, at higher levels in categories where payments are being made by patients either partly or fully (Table 4) Pattern of utilisation in regard to these two categories also suggests that possibly beyond certain level of governmental expenditure, there is diminishing (or crowding out) of private sector's role This is brought out, in general, as we move from medium expenditure states and beyond it, through declining proportionate shares of private facilities in aforesaid two payment categories (Table 4) It is also pertinent to note that from low to high expenditure states there has been consistent decline in private sector's share in the category of treatment not taken (Table 4) Presumably it reflects that increasing levels of government expenditure and in turn increased health facilities as well as increased awareness about them has led to a decline in avoidance (in use) of health facilities

Utilisation of private sector's facilities has been relatively less in availing in patient care (Table 5) By and large pattern of utilisation remains almost similar to that in OPD care (Table 5) However, stronger tendency of private sector towards profit earning or cost recovery is obvious in in-patient care As such, proportions of private sector in either of above mentioned five types of facilities is many times more in 'on payment category' The share in the similar facilities from private sector remained, in contrast, negligible under either of free or partly free categories (Table 5)

V

Untreated Spells of Sickness: Education and Caste Factors

The causes of not getting treatment as classified by NSSO are four fold These include (i) no medical facility, (ii) long waiting, (iii) financial reasons, (iv) ailment not considered serious, (v) lack of faith in the system of medicine, and (vi) other reasons We have reclassified the untreated spells of sickness into two broad categories One of these included the reasons (i) to (iii) and the other included the remaining three The former was called as 'non availability and financial reasons' and the latter was termed as 'other reasons'

Percentage distribution of population which could not avail of health care in spite of being sick depicts an appreciable differential across education levels and caste groups It is, for instance, interesting to note that within the same state or same sector or across sectors, level of awareness about health facilities presumably associated with the level of education tended to influence perception of respondents about availability (or otherwise) of the health facilities

In general, the distribution of respondents across education levels depicted in that range within rural sector of untreated spells (of sickness) due to non-availability of facilities or financial reasons was much higher for illiterates relative to their counterparts in other educational levels Thus, the lowest to highest percentage (of untreated spells) for illiterate class across all-India aggregate in rural areas due to the above-mentioned reasons was between 10 and 18 per cent The comparable percentage for respondents with different education levels, namely, 'below primary', 'below secondary', 'secondary and above' remained respectively 1 5 2 4 per cent, 9-17 4 per cent and 1 2 per cent

Likewise in the urban sector, the all India range of untreated spells due to reasons of non availability across above mentioned categories of education levels were observed to be respectively 4 9 per

Category	Rural: Government	Rural: Private	Rural: All	Urban: Government	Urban: Private	Urban: All
Low expenditure group	232 88	778 60	543 97	336 22	1133 67	800 92
Medium expenditure group	338 91	722 06	632 74	350 98	849 88	682 65
High expenditure group	513 37	856 44	599 07	366 09	1082 83	413 81
All India average	320 34	733 38	597 06	385 02	1206 01	933 33

cent, around 1 per cent, 1-11 per cent and 10-22 per cent Observing that declining range is usually associated with higher levels of education, high range in the last category (namely, secondary and above) in urban areas possibly denotes more of lack of facilities Rather than lack of awareness about them it may also mean specific health needs emerging on account of better awareness

At individual state level influence of educational status comes out more prominently across the three groups In fact the pattern of untreated spells owing to non availability across individual states suggests that beyond per capita health expenditure status, higher education levels tend to be uniformly associated with reduced range of respondents having received no treatment due to non availability Similar observation holds true for rural as well as urban areas These observations indeed corroborate our earlier findings emerging from non parametric analysis of published as well as primary data [?]

In an analogous manner to education status significant differentials across scheduled castes (SC)/ scheduled tribes (ST) versus other castes are also observed Both in rural and urban areas untreated spells owing to non availability factor remained very low in the categories of SC/ST respondents The all India range for the latter in rural areas for instance prevailed between 3 6 per cent (SC category) and 1 3 per cent (ST category) in contrast to general categories which was around 37 per cent

Corresponding urban differentials (owing to caste) in untreated spells (due to non availability) could also be considered as high observing the relative ranges relating to SC ST and other castes which remained respectively as 0 31 4 per cent, 0 005 0 72 per cent and 53 62 per cent Even state level variations across three expenditure groups depict uniformity in pattern of influence emerging from caste factor [?]

VI
Insurance Status and Cost of Treatment

Paymentwise status of respondents also depicts that higher per capita government expenditure favoured more free in patient facilities In fact, as many as 33 per cent of rural and 27 per cent of urban respondents in high expenditure group of states availed free health care Conversely, lowest percentage of free utilisation of health facilities in either rural (23 35 per cent) or urban areas (9 58 per cent) was observed for low expenditure states Further, the pattern connotes that free utilisation was relatively more in rural areas relative to their counterparts (Table 6)

The coverage under employer's welfare scheme remained low In rural areas it varied between 3 27 per cent (medium expenditure group) and 8 33 per cent (high expenditure group) In urban areas, similar coverage remained higher and ranged between 8 30 per cent (medium expenditure group) and 13 83 per cent (low expenditure states) Inclusive of both the non payment categories namely, 'no payment' and 'employers' medical welfare scheme' thus approximately 40 per cent of respondents in either of urban or rural areas in high expenditure states utilised free health care In low and medium expenditure states such free utilisation however ranged around 30 per cent

It emerges therefore, that nearly 60 70 per cent respondents availed health care at their own cost This would imply that large amounts have been spent by household sector and the same in relation to governmental health care expenditure would provide better picture with regard to total per capita expenditure and households' spending propensity towards health care Prior to such estimation it is pertinent to look into some relevant aspects like average duration of stay average expenditure per illness and per person hospitalised payments made to hospital and the like

In rural as well as urban areas, average duration of treated sickness in private sector is less than that of the average duration in government sector (Table 7) With exception of medium expenditure group, probably shorter duration is one of the factors which underlies lower treatment expenditure in private sector (Table 7) Simultaneously longer duration of treated sickness in public hospitals could be considered indicative of over use of government facilities In this regard, however, there does not emerge any systematic pattern across the state groups (Table 7)

In terms of average duration of stay it is observed that rural respondents had longer stay in hospital (Table 8) This may be due to nature or quality of the treatment in rural areas On the contrary urban respondents following hospitalisation paid more than their rural counterparts (Table 8) In general duration of stay varies between 13-18 days (in rural areas) and 12 14 days (in urban areas) Corresponding to it, hospitalisation expenditure ranged between Rs 800 891 (rural areas) and Rs 834 1158 (urban areas) Any pattern denoting systematic variation across the three expenditure groups was found non-existent (Table 8)

There prevailed however, discernible systematic pattern across state groups, in regard to amount of payment made to government hospitals (Table 9(a)) These payments had a range of Rs 233-513 (rural areas) and Rs 336-66 (urban areas) and seemed to be rising as one moves from low to high expenditure states (Table 9) Comparable range in payments to private hospitals could be observed as Rs 722-856 and Rs

Table 9(b) Estimates of State Government and Household Expenditure in India (All India and State Group 1986 87 and 1990)

State Groups	1986 87[1] Per Capita State Government Expenditure	Per Capita Household Expenditure	Per Capita Total Expenditure	Government Household Expenditure (Per Cent)	HHE/PCI (Per Cent)	1990[2] Per Capita State Government Expenditure	Per Capita Household Expenditure	Per Capita Total Expenditure	Government Household Expenditure (Per Cent)	HHE/PCI (Per Cent)	Difference (1986 90) Per Capita State Government Expenditure	Per Capita Household Expenditure	Per Capita Total Expenditure	Government Household Expenditure (Per Cent)	HHE/PCI (Per Cent)

2 For state government expenditure Reddy K N (1990) and for household expenditure NCAER (1990)

850-1134 (Table 9). It had no movement, however, in line with state expenditure groups (Table 9)

VII
Cost of Health Care

An idea about cost of health care borne by government and households is provided in Table 9(b)[4] In 1986-87, the states and households in India had spent together per capita an amount of Rs 160 54 Nearly 39 per cent of which came from state governments and the rest around 61 per cent came from households Groupwise across states, the per capita expenditure was highest in the high expenditure group (Table 9(b)) An interesting feature to observe is that in low and medium expenditure groups, where state's health outlay is lower than high expenditure group, households contributed larger proportion to total per capita health expenditure Thus in contrast to 42 per cent contribution in high expenditure group, households among low and medium expenditure groups had contributed respectively around 62 and 57 per cent (Table 9(b))

In the duration between 1986 and 1990, per capita expenditure had risen almost by 68 per cent On an average, in 1990, per capita health expenditure in India is estimated to be Rs 269 71 Of this, nearly 43 per cent came from state governments and around 57 per cent was from households Across groups per capita outlay remained highest (Rs 393) for high expenditure states Conversely the lowest (Rs 242) was observed for low expenditure states Like the pattern in 1986 it was observed again that more household contribution to per capita outlay came forth in states with lower government spending (Table 9(a))

Between 1986 and 1990, there has been general increase in both government and household components of health care expenditure (Table 9(a)) All India average and group averages, however, depict that relative to households, state's contribution has gone up (Table 9(b)) The relative growth of state component (above the households counterpart) at all-India level remained around 13 per cent Exceptional case of low expenditure states suggests however decline in state's contribution by around 5 per cent (Table 9(b))

Another pertinent feature further emerging from above estimates in unchanging proportion of per capita income being spent by households In both years, namely, 1986 and 1990, an average Indian household thus spent around 3 per cent of its per capita income (Table 9(a)) Except for high expenditure states, the change in this proportion between 1986 and 1990 has been marginal (Table 9(b)) Presumably this invariant propensity to spend on health care shows that Indian households treat health care as an essential commodity

VIII
Levels of Inequality in Utilisation of Health Care

The discussion in Section V highlights that besides government expenditure other factors, namely, education and caste status of respondents also have significant bearing upon awareness and thereby affect access and pattern in utilisation of health care facilities[5] However, as mentioned in Section VI in most instances, households have been contributing more towards per capita health expenditure than the government. It is likely, therefore, that the ability to spend might have determined utilisation patterns of health care services One way of looking into spending ability of households would be to categorise them into different expenditure fractile groups With the presence of felt need for health care, willingness to spend matched with ability would determine access and utilisation in health care in favour of higher expenditure fractile groups Existence of inequality caused on this count would be denoted by looking into ratio of uppermost to lowest expenditure fractiles The value of this ratio exceeding unfty would

Note LES MFS and HES denote respectively low, medium and high expenditure states

denote an existence of inequality and bias in favour of higher expenditure group of respondents within any state These results for each group of states pertaining to different aspects are presented in Table 10

These ratios reveal notable prevalence of inequality among all groups of states in regard to pattern of utilisation and expenditure on health care facilities The main features depicted through analysis of these ratios include the following (a) In rural areas, as many as 58 and 33 per cent of states respectively among low and medium expenditure groups depicted higher utilisation of allopathy system of hospital by upper fractile groups In this regard urban areas however, have lower degree of inequality (Table 10(a)) (b) Distribution of OPD by system of medicines suggests higher utilisation among low expenditure states by upper fractile urban respondents in four systems namely, allopathy ayurvedic, unani/hakimi and others The same was true in medium expenditure states relating to ayurvedic system only Among rural respondents evidence suggests systems like homeopathy (among low expenditure states) and unani/hakimi (among medium expenditure states) to have been utilised more by upper fractiles Generally, upper fractile groups in high expenditure states and particularly rural OPD respondents seemed to have derived more access in homeopathy and unani/hakimi systems (Table 10(a)) (c) Viewed across different sources of treatment (namely, public private, etc) pattern of utilisation favouring upper fractile groups is found more dominant in low expenditure groups (Table 10(a) item 3) In most of the state groups rural respondents in upper fractile groups seemed to be visiting more public hospitals, dispensaries private and ESI doctors Urban upper fractile respondents utilised relatively more of facilities at private hospitals and nursing homes (Table 10(a)) (d) Distribution of rural OPD respondents by payment categories in both low and medium expenditure groups of states depicts that respondents in upper fractiles utilised more facilities in any of the payment or non-payment categories (Table 10(a), item 4) However, in high expenditure states disparity is observed only among urban respondents who paid for health services in private institutions (e) It is observed that males in rural upper fractiles among low and medium expenditure states had utilised more of in patient facilities In contrast, females from rural upper fractiles of high expenditure states and urban upper fractiles among low expenditure states had availed of more in-patient facilities (Table 10(a), item 5) (f) Ability to pay for services had considerable influence in availing health services both in public and private sectors A cursory glance at comparative figures for average payments made to government and private institutions reveals that, except rural OPD in medium and high expenditure group, upper fractiles paid more than twice their counterparts (Table 10(b), item 1) Further it is observed that though there was marginal difference between stay days of upper and lower fractiles in either of wards in government or private hospitals, the upper fractiles generally spent around twice or more during their hospital stay (Table 10(b), items 2 and 3)

IX

Conclusions and Policy Implications

The utilisation of health services has been discussed in this study from various angles The degree of utilisation is seen through a comparative picture across three state categories viz, low medium and high expenditure groups The possible reasons for different degrees of utilisation have been also discussed The main findings of the study and their implications in regard to the National Health Policy are summarised as follows

(i) In accordance with the guidelines of the National Health Policy the planned efforts in the country have also led to the development and increased utilisation of Indian and other non allopathic systems of medicines This is revealed through, for instance, by increased percentage of respondents utilising these systems The percentage utilisation of homeopathy, for instance, has gone up by around 10 per cent in rural as well as urban areas In a similar way the percentage utilisation of ayurvedic system has risen by 7 and 2 per cent in rural and urban areas respectively This suggests that the thrust in the National Health Policy to encourage indigenous systems has indeed helped in the development of these systems

(ii) The level of governmental expenditure had direct influence on the availability as well as utilisation of various health facilities in the country As such the level of utilisation has been higher in states which have relatively higher per capita expenditure on health care On the contrary, the states with lower per capita governmental expenditures have depicted lower levels of utilisation

(iii) It has been observed that majority of out patients had utilised the services of private doctors This is followed by utilisation of public and private hospitals The inpatient care however has been availed more at the public hospitals The pattern thus indicates that the government institutions have been utilised more for getting inpatient care This suggests that unlike the policy guidelines the role of lower level government institutions, like PHCs, has not increased The reasons for this include lack of adequate facilities in such institutions and the presence of proportionately high numbers of private practitioners working in

iii) Paying special ward	1.62	1.83	0.00	0.84	1.96	1.55

Note LES MES and HES denote low medium and high expenditure states respectively

rural as urban parts of the country Even the information available from the latter survey of NCAER also suggests that between the years 1987-90 there has been no substantial change in this pattern of utilisation

(iv) The distribution of in patients across three types of wards namely free general and special also suggests that the free wards of public health institutions namely public hospitals and PHCs, have been utilised more in each of the state groups Unlike this the other types of wards, namely, paying general as well as paying special have been utilised more at the non-governmental institutions This outcome in terms of ward utilisation has been in line with the policy guidelines which suggest that expensive tertiary care should be encouraged more in private sector

(v) It is observed that the utilisation levels in OPD as well as in patient services have been higher in rural areas relative to their urban counterparts The pattern in rural areas also bears an inverse correspondence with the level of government expenditure on health In the high expenditure group of states, for instance both OPD and in patient utilisation has been lower than their counterparts in other expenditure groups It therefore, emerges that more of the per capita expenditure on health in high expenditure states is going towards expensive care in urban sector

(vi) The breakup of health facilities in terms of five items namely medicines X ray/ECG/EEG, any other diagnostic treatment, surgical treatment and any other treatment, depicts wider spread of private sector in OPD care and the latter has come forth more in rural areas

It is also observed that whenever government expenditure is higher for instance in high expenditure group of states the private sector has shown a decline in its *pro rata* contribution to health facilities The analysis across three expenditure group of states denotes that crowding out of private health sector is evident with levels of government expenditure growing beyond a certain point

(vii) The analysis of reasons for untreated spells of sickness suggests that non availability and financial reasons remained more prominent in rural areas due to factors like low education and preferential treatment for SC/ST

(viii) It is interesting to observe that the households in India have tended to consider the health care as one of the necessary commodity This observation emerges from the fact that in both the years namely, 1986 87 and 1990, the proportion of households income being spent on health has remained almost invariant around 3 per cent The states where the government expenditure levels have been lower the households have tended to spend more This suggests that there seems to be some minimum expenditure level which has been maintained through households invariant spending propensity This situation, coupled with the fact that the coverage of health insurance across different groups of states has remained only around 3 8 per cent, suggests an urgent need for initiating appropriate insurance schemes which has also been highlighted in the health policy document

(ix) It is generally observed that duration and cost of hospital treatment in government sector has been higher than the private sector hospitals In this regard the latter survey of NCAER indicates that cost of hospital treatment in urban areas has gone up relative to the rural counterparts Consequently the rural urban disparity in terms of treatment cost in private sector has indeed widened This may be attributed to the capital intensive nature of specialities in private urban hospitals Though the overall resource implication of such outcomes are debatable, yet it falls in line with the National Health Policy s objective to encourage private sector s participation in expensive type of care that may avoid diversion of government funds from cheaper and essential primary health care

To sum up our analysis of macro level information suggests that the pattern of utilisation in our country had some of the desirable outcomes in terms of (a) growing popularity of indigenous non allopathic systems and (b) growth in private sector s involvement in expensive tertiary care Nonetheless as against the National Health Policy guidelines it is distressing to note that the regional disparities in health service utilisation among different expenditure groups of states as well as rural urban disparities tend to continue Further in spite of inadequacy of health services and prevalence of inequality in utilisation there has been no serious governmental initiative to encourage appropriate utilisation by means of devising health insurance and other cost recovery mechanisms There lies therefore, an urgent need to look carefully into some of these aspects such that the policy guidelines could be really implemented in a satisfactory manner

Notes

[Authors are grateful to Ford Foundation for financially supporting this study at IIHMR Jaipur]

1 In urban areas however almost similar attendance rates relating to private doctors (52 per cent) is noticeable both for low expenditure as well as high expenditure states

2 See for instance Purohit and Siddiqui (1993)

3 The influence of caste factor in availing health care using primary data is also highlighted in other studies See for instance Purohit et al (1992) and Purohit and Siddiqui (1993)

4 For an earlier estimate of health expenditure in the year 1984 85 see for instance Giridhar et al (1987)

5 Further So long as poverty remains the issue of equity in health care is kept alive ' (see for instance Mueller 1986 p 131)

Industrial Disputes in India

An Empirical Analysis

Bibhas Saha
Indranil Pan

The present paper tries to identify some of the determinants of industrial disputes (both strikes and lock-outs) by developing an econometric model using disputes data for 19 industries over seven years from 1980 to 1986. The dependent variabe of the model is industry-wise mandays lost per employee from disputes and independent variables are the degree of trade unionisation, average factory size and average monthly earnings oj an employee. It is found that in more unionised industries, mandays lost from disputes are likely to be less compared to less unionised industries. In contrast, industries with larger average factory size will have greater mandays lost. Employees' monthly earnings seem to be a weak variable having ambiguous and almost insignificant effects on mandays lost.

I
Introduction

COLLECTIVE bargaining is a way of distributing organisational rents (i e, economic profits) among workers and employers. While the size of the organisational rents constitutes the scope of the bargaining, the relative shares of the two parties are determined by a number of factors such as union power, skills of bargaining, labour laws and regulatory framework. In an actual process of bargaining, parties sometimes deliberately pull out from a negotiation for some strategic reasons and such strategic pull outs are generally followed by strikes, lock-outs and other types of agitations which are called industrial disputes.

The subject matter of this paper is industrial disputes in Indian industries. The frequency of industrial disputes in India is very high compared to the industrialised countries. For instance, between 1980 and 1982, the Indian industrial workers were reportedly engaged in 2055 strikes per year (on average) which resulted in a loss of 14 million mandays per year. The corresponding figures for France between 1977 and 1983 were only 494 and .38 million respectively [Windmuller *et al* 1987]. In terms of the combined data on strikes and lock-outs, which will be referred to as industrial disputes, the Indian industry from 1984 onwards, however, witnessed a declining trend unlike in the preceding 10 years; in the early years of the 80s, the trend of industrial disputes was increasing.

Maintaining industrial peace is as important for a worker as it is for an employer. Disputes tend to reduce the size of the organisational rents and inflict damages on both sides. From a dynamic point of view, disputes pose problems for rationalising labour and capital. Such problems are indeed becoming visible in the context of exit of sick units. However, economic theory on negotiations and strikes predicts that in a real world negotiation, disputes may become unavoidable because each side might have different information about the gains from bargaining. Yet the duration of disputes can (and should) be reduced through appropriate regulatory and legal mechanisms. Additional policies can also be aimed at achieving this objective. Therefore, we need a clear understanding of what factors influence the frequency and duration of disputes.

The present paper tries to identify some of these factors by developing an econometric model using disputes data for 19 industries over seven years from 1980 to 1986. The dependent variable of the model is industrywise mandays lost per employee from disputes. Its determinants that are incorporated in our model are the degree of trade unionisation, average factory size and average monthly earnings of an employee. The degree of trade unionisation reflects the bargaining strength of the workers and average factory size is meant to capture some of the effects of employment regulations which apply on the basis of factory size. The single most important cause (responsible for 30 per cent) of disputes as shown in *Pocket-book of Labour Statistics, 1980-90* is workers' wages, bonuses and other payments. Therefore, we have included employees' earnings as a variable in the model. A dummy variable is also used to pay special attention to the historic textile strikes (that started in October 1981 and lasted more than one year) and similar disputes in other industries for the years 1981 to 1984. Two more important variables, market demand which plays an important role in determining organisational rents and the degree of employers' unionisation which can be read from the employers' affiliation to trade associations, could not be used for some data related problems and their exclusion certainly limits the scope of our analysis.

The main results are as follows. First, there is a negative relationship between mandays lost and trade unionisation and a positive relationship between mandays lost and factory size. Employees' earnings show insignificant and ambiguous relationship with mandays lost. In other words, in more unionised industries, mandays lost from disputes are likely to be less compared to less unionised industries assuming other factors unchanged. In contrast, industries with larger average factory size, will have greater mandays lost than that with smaller average factory size.

Secondly, the year 1984 which is one of the worst years of the decade in terms of disputes and which witnessed some important amendments in the Industrial Disputes Act, seems to be generating an effect similar to structural breaks.

Thirdly, our model can also be used to relate to the pattern of disputes in the 80s. The profile of the disputes in the 80s has two distinct phases—increasing up to 1984 and decreasing afterwards. The effect of employees' earnings, though statistically not very significant, is dissimilar in the two periods and in fact coincides with the profile of disputes. Thus employees' earnings can be regarded as a factor affecting the profile. Among the other two variables, the effect of factory size might have been dominant in the increasing phase of the profile and the effect of trade unionisation in the declining phase.

The negative correlation between mandays lost and trade unionisation nullifies the popular perception which is gaining ground in recent years that trade unions are largely responsible for disputes. It also raises an important question whether stronger trade unions are inclined to more strikes and disputes. Theoretically a strong trade union is more able to implement a threat of strike; but whether the trade union would actually carry out the threat or not, depends on the toughness of its opponent and its own expectation about the outcome of the strike. In fact, the strong threat of a strike can itself avert the strike by making employers more willing to negotiate. From the other end, employers also find it difficult to impose a

lock-out when confronted by strong unions. Thus, strong trade unions can help to keep negotiations from turning into disputes. However, one should also consider that if there were no unions (or were only weak unions), the employers can appropriate all organisational rents. Such an outcome, although unfair, is indeed dispute free. Therefore, the effect of trade unions on disputes as such as ambiguous. In fact, the revelation of information through negotiation, learning and expectations of a negotiating trade union about the outcome of a dispute play crucial roles in containing or extending the duration of the dispute.

In our model due to data related problems we cannot distinguish between strike and lock-outs and thereby we are unable to speculate the relationship between disputes and trade unions. However, we can say that the observed negative relationship between mandays lost and degrees of trade unionisation is perhaps a result of heavy lock-out incidence witnessed from 1982 onwards. Although we do not have firm or industry level data on lock-outs, we suspect that such lock-outs were more frequent in industries where the workers were weakly unionised.

The positive correlation between mandays lost and average factory size has some implications for employment regulations. Collective bargaining in large factories normally follows a formal course within the framework of Industrial Employment Act and Industrial Disputes Act and it is expected that bargaining in this environment would be more dispute free than otherwise. But our model casts some doubts on the efficacy of such regulations in reducing the frequency of disputes. It may also imply that an employer with adequate bargaining power which is presumably the case with the owners of large factories, is more willing to exercise lock-outs as bargaining strategies.

The paper is organised as follows. In the next section, we present a brief overview of the literature which provides the context of our work. The regulatory framework of industrial relations is very important in understanding the structure of disputes. Since these regulations are not directly incorporated in our model, we discuss them separately in Section III. Section IV presents a bird's eye view on aggregate strikes and lock-out during 80s and late 70s. The main model and the results are discussed in Section V and VI respectively, while some further comments are saved for the concluding section.

II
Economic Literature

The economic literature on industrial disputes which has been mainly a literature on strikes, has developed in two disjoint branches—theoretical and empirical. While the theoretical literature has tried to explain why strikes take place, the empirical literature has examined the relationship between strikes and other closely related variables such as wage, inflation and unemployment rates.

The problem of explaining strikes is quite old and still, in a sense, unresolved. The main difficulty of providing a theory of strike which was first discussed by Hicks (1965) and later came to be known as the Hicks paradox, lies in the very nature of the problem. If there is a theory of strikes that predicts the incidence and outcome of a strike, then the employer and workers can avoid the strike by agreeing to the same outcome in advance; but then the theory would cease to hold. This paradox indeed became a bottleneck in almost all strike models.

However, Hicks suggested two avenues of research—reputation and private information. Hicks argued that workers (or their unions) engage in strikes to maintain their reputation as hard bargainers. This argument, although very appealing, has not yet been utilised to develop a satisfactory model The second argument of Hicks—that is, private information—has led to a substantial volume of research. In private information models [Hayes 1984], a financially weak firm whose profits are not known to the workers, cannot convince the workers about its inability to meet high wage demands and therefore, accepts strikes as a price for lower wages. These models were the first to point out that industrial disputes play an important role in transmitting information from the informed to the uninformed party and such information transmission can significantly alter the course of disputes.

The empirical literature on strikes has been preoccupied with different questions Some of the questions are: Are strikes procyclical? Is there an inverse relationship between strikes and wage increase? A number of serious studies in the context of the US, the UK and Canada, have found significant negative relationship between strikes and real wage increases and between strikes and the unemployment rate [Ashenfelter and Johnson 1969, Abbott 1984]. Although, most of the empirical studies are rarely seen to be backed up by theoretical models, they have been considered valuable for bringing important facts into light and providing materials for theoretical research.

In the context of India, the literature on strikes and disputes is at its infant stage as the problem of industrial disputes has not received much attention from the economists, even though journalists and legal experts have been writing on this problem for many years (see *Economic and Political Weekly*, January 18, and March 11 and 18, 1989 for some interesting reports on disputes). Our work, being primarily empirical, tries to identify some determinants that can explain the problem of industrial disputes over a significant part of the 80s. Such findings can be useful in providing directions for more detailed research and have the additional merit of verifying the popular perceptions of the problem.

III
Regulatory Framework

Industrial relations in India are regulated by three major acts: (i) the Trade Union Act, 1926, (ii) the Industrial Employment (Standing Orders) Act, 1946 and (iii) the Industrial Disputes Act, 1947. The Trade Union Act allows registration of unions in an industrial establishment with no restrictions on the number provided that a union has at least seven members from the establishment. The Industrial Employment Act (in short IE) was intended to make labour contracts complete, fair and legally defensible. Under this act, the employer is required to inform his employees of their rights and obligations, the terms and conditions of work, conditions of recruitment, discharge, disciplinary actions, etc. However, until 1982, the scope of the act was limited only to establishments employing 100 or more workers. A 1982 amendment of the act made it applicable to all establishments employing 50 or more workers.

Any dispute on terms and conditions of work arising from the Industrial Employment Act comes under the purview of the Industrial Disputes Act (ID). This act underwent a number of significant amendments in 1976 and then again in 1982 and 1984. Apart from providing an elaborate process of government mediated conciliation, voluntary arbitration and a three-tier system of adjudication, the ID Act tried to reduce the incidence of strikes and lock-outs by making strikes and lock-outs legal only under certain conditions. Under this act, regular (but not the casual or 'badli') workers are eligible for lay-off compensation or retrenchment benefits if the factory size (in term of employment) is at least 50. However, lay-offs, retrenchment and closure in factories employing 100 or more workers, will be considered illegal if the employers do not obtain prior written permission from the relevant state government. This particular clause of the ID Act has been a subject of controversy in the context of the recent debate on exit policy. This clause was introduced in 1976 during emergency as part of a more direct control on the employers and employment. At that time the specified factory size was 300 which was later revised to 100 in the 1982 amendment of the ID Act.

Like many other regulations in India, employment regulations also work on the

basis of the factory size. If we summarise the main benefits of the regulation from the point of view of the workers, they can be called bargaining rights (from the Trade Union Act), income security (from the IE Act) and job security (from the ID Act). The term security should be understood in the sense of eligibility of receiving compensation and in the sense of restrictions on lay-off or closure. While the bargaining right is granted in virtually all factories (employing at least seven workers), income security is provided only when the factory size reaches 50 and employment security is confined to factories employing 100 or more workers. Therefore, in studying industrial disputes one should consider various sizes of factories coming under the realm of different regulations and analyse the consequent impact on bargaining strategies of each party. In large factories where the workers enjoy all the benefits of regulation, bargaining follows a formal process often culminating into legal battles. As a contrast, in small factories where the workers enjoy only the trade union rights and not the benefits of IE or ID Acts, trade unions heavily rely on their political nexus to create informal pressure on the employers. To sum up, larger factory size leads to (i) more organisational rents, (ii) more powerful employees, (iii) more powerful employer, all of which can contribute to serious disputes. This observation has motivated us to include factory size as a determinant of industrial disputes in our econometric model. Factory size, as we know, is also important for regulating capital and products which can influence the incidence of disputes as well by affecting the size of the organisational rents.

In evaluating employment regulations, Mathur (1992) notes that in manufacturing industry where the employment security is highest, 78.5 per cent of establishments employ less than 50 employees and another 10.8 per cent of establishments less than 100 employees, leaving bulk of the workers outside the scope of regulations. An econometric study by Fallon and Lucas (1991) claims that the 1976 amendment of the ID Act restricting the employers' right to lay-off or retrench (in factories employing 300 or more workers) has led to a significant reduction in industrial employment.

An important question to be answered in this regard is whether the employment regulations have really acted as a deterrent for industrial disputes or have reduced the duration of disputes. Evidence suggests that they probably have not. The interpretation of the acts itself has been a problem and a source of disputes. There have been innumerable court cases where the employees wanted their units or organisation to be declared as 'industry' and themselves as 'workmen', which are crucial for the applicability of the ID Acts.

It is also not clear whether the threat of government intervention in the form of conciliation and adjudication has helped quicker settlements or not. For example, between 1980 and 1988, about 16 per cent of the disputes per year were disposed by office of the Controller of Industrial Relations machinery after a delay of at least four months. However, the rate of settlement through government intervention rose steadily from 27.5 per cent in 1982 to 48 per cent in 1987. But there is a danger that official agencies can act like a 'captive regulator' and activate a biased outcome In fact, a standard practice is to influence the government to declare a strike or a lock-out illegal and there are many loopholes in the acts that can be utilised to this end. For example, an employer in a larger firm opting for a closure is required to serve a notice to the government at least 90 days in advance asking for permission. However, according to the ID Act, if he does not receive any response from the government within 60 days, the permission for closure would be deemed to have been granted. Clearly, there is an incentive for the employer to influence the relevant administrative agency to delay the response beyond 60 days. Thus the scope of 'legal' disputes itself is quite large.

The regulatory framework is crucial for understanding industrial relations and the above discussion should be viewed as supplementary to our econometric analysis, although we have tried to capture some indirect effects of regulations through the variable factory size.

IV
Strikes and Lock-Outs

In this section we review some data on the two types of disputes—strikes and lock-outs. After the lifting of Emergency in 1977, the number of both strikes and lock-outs increased dramatically. In fact, between 1977 and 1983, the number of strikes was consistently at a very high level as reflected in Table 1. After 1983, the number of strikes declined sharply. In contrast, the number of lock-outs has shown a much greater increase from 1982 onwards. The data on mandays lost reveal the same pattern. Mandays lost due to strikes were remarkably higher over a period of seven years from 1978 to 1984 which almost coincided with the years of greater number of disputes. The year 1980 registered a higher number of strikes but with a very small number of mandays lost. But the year 1977 can be considered exceptional, as it had the third highest number of strikes, but with the lowest number of mandays lost indicating smaller duration of strikes and/or involvement of fewer workers. Similarly, mandays lost due to lock-outs showed an increasing trend with the increasing number of lock-outs. It is also noteworthy, that from 1978 to 1984, the number of mandays lost due to strike has always been far greater than that due to lock-outs. It is only after 1984 that mandays lost due to lock-outs settled around 20 million and exceeded mandays lost due to strikes which came down to a level of 12 to 14 million.

The average intensity of a strike in terms of mandays lost as reflected in mandays lost per strike has generally been in the order of 10,000 mandays with the exception of two years, 1982 and 1984 which correspond to the years of prolonged textiles and jute strikes. Moreover, from 1982 onwards, this figure is showing a declining trend implying that on an average each strike is getting less costlier (in terms of mandays lost). On the contrary, each lock-out has been four times more costlier on average than strikes. While the year 1982 registered highest mandays lost per lock-out, the trend after a short dip between 1982 and 1985 has again been rising. In fact, mandays lost per lock-out in 1988 is almost as high as that in 1982. Thus,

TABLE 1: STRIKES AND LOCK-OUTS

Year	Strikes Number	Strikes Mandays Lost (Million)	Strikes Mandays Lost Per Strike (Thousand)	Lock Outs Number	Lock Outs Mandays Lost (Million)	Lock Outs Mandays Lost Per Lock-Out (Thousand)
1976	1241	2.8	2 25	218	9.9	45.41
1977	2691	1.3	48	426	11.9	27.93
1978	2762	15.4	5 57	425	12.9	30.35
1979	2709	35.8	13 21	339	8.0	23.59
1980	2501	12.0	4 79	355	9.9	27.88
1981	2245	21.2	9 44	344	11.0	31.97
1982	2029	52.1	25 67	454	22 5	49.55
1983	1993	24.9	12.49	495	21.9	44.24
1984	1689	39.9	23 62	405	16.0	39.5
1985	1355	11.4	8 41	400	17.5	43.75
1986	1458	18.8	12 89	434	13.9	32.02
1987	1348	14.0	10 38	451	21.3	47.22
1988	1304	12.5	9.58	441	21.4	48.52

Source: Pocketbook of Labour Statistics.

it can be said that if workers are blamed for indulging in more strikes, employers should be held even more responsible for rampant imposition of more costly lock-outs.

Thus one characterises the years of the late 70s and early 80s as the era of strikes dominance and the later part of the 80s as the era of lock-outs dominance. However, it appears puzzling why the lock-outs incidence increased significantly in the later part of the 80s, since the 1982 amendment of the ID Act (which came into force in 1984) actually strengthened the hands of the workers by restricting the employers' ability to lay-off. To solve this puzzle, we can think of two factors that have possibly influenced the pattern of disputes: (i) high GNP growth rate, (ii) technical change and rationalisation of labour. High GNP growth rate has perhaps helped easier resolution of strikes The high growth rate has also required technical changes and rationalisation of labour. Many large firms which are restricted from laying off or retrenching workers, have probably taken resort to strategic lock-outs to put pressure on the workers to quit or to opt for voluntary retirement. So the increasing number of lock-outs should not be viewed simply as a sign of increase in the bargaining power of the employers. It can also be a strategic ploy for rationalising labour.

V
Model and Methodology

(a) *Choice of Variables*

Having described the importance of the regulatory framework and the interesting pattern of disputes that has emerged in the 80s, we set out to identify some determinants of disputes and test their statistical significance. The dependent variable we have chosen is mandays lost (in short, ML) from industrial disputes. Since the data on mandays lost combine not only the duration of disputes but also the number of workers and the number of workshifts per day, the costs of disputes are not comparable across industries. So we redefine the variable on per employee basis by dividing the total mandays lost from disputes in an industry by the total number of employees of that industry. However, since we are using the total number of employees rather than the total number of workers involved in disputes as the basis of normalisation, the resultant figures are likely to understate the actual duration. Therefore, our results should be interpreted only in terms of average (per employee) duration of disputes. Another important point to note is that the data on mandays lost from industrial disputes cover both strikes and lock-outs and in this respect, our model is different from other empirical models in the literature which are concerned only with strikes.

The variables that are chosen as possible determinants of disputes are the degree of trade unionisation (TU), average monthly earnings of an employee (ME) and average factory size (FS). With an industry being the unit of observation, all data correspond to the two-digit level of aggregation. The data sources are *Annual Survey of India, Indian Labour Yearbook* and *Pocketbook of Labour Statistics*.[1]

The variable TU is defined as the number of employees listed as trade union members in an industry divided by the number of employees of that industry. One problem with this variable is that its data set probably suffers from irregularities, because the number of trade union members is reported only from the unions submitting returns and therefore it is natural to suspect that many other unions have been left out. However, industrywise comparison reveals that this problem is not so serious across all industries. For example, cotton textiles do show expectedly high degree of unionisation whereas the jute industry can be suspected to be poorly represented. Despite this data problem, there are compelling economic reasons to include this variable. Trade union membership is an important constituent of bargaining power. It not only helps the workers to steer a negotiation along a planned and formal path, but also enables them to lobby in the government through political affiliation.

The variable ME captures some of the important causes of disputes. Of all the disputes at least 30 per cent is caused by issues relating to workers' incomes. The figures on employees' earnings cover not only wages but also other payments made to the employees. Mandays lost per employee is expected to be negatively correlated to earnings of the employees.

The average factory size (FS) is obtained by dividing the total number of employees in an industry by the number of factories. Admittedly, by averaging out we are ignoring the distribution of factory sizes within an industry which itself is an important factor. Ideally, one should study the effects of factory size both within the industry as well as across the industries We have ignored the within industry effect for simplifying reasons.

The main motivation of the variable FS is to capture some of the effects of employment regulations which we have discussed in Section III We know that in large firms, workers enjoy both income and employment security through IE and ID Acts and to protect their secure positions, workers in these firms invest heavily on trade unions, political affiliation and legal assistance. To counter this, the employers also hire specialised expertise on disputes and personnel management. Besides, the process of resolving disputes is generally overseen and monitored by government agencies. Therefore, one can expect that disputes will be resolved much more quickly in large than in small firms. Our study tries to verify this perception.

Apart from the above-mentioned variables, we have included dummy variables for the years 1981 to 1984 to pay special attention to the historic textiles strikes and similar disputes in other industries. In these four years, mainly two industries—cotton textiles and jute—showed very high levels of disputes which are also responsible for inflating the figures for total disputes unlike in the years before and after this period. Therefore, we tried to separate out the effects of such industries by introducing a dummy variable for them.

It would have been more satisfactory if we incorporated employers' unions into our analysis. The employers' unions (or trade associations) play an important role in disputes that concern the entire industry. Also in matters of firm-specific disputes, the employers' ability to arrive at a favourable settlement may depend on whether the employers are associated with a major trade association or not. But the available data on employers' unions are quite incomplete and so underreported that the degree of unionisation of the employers reduces to almost zero for all industries. This has discouraged us from using this variable.

Another important variable that has been left out is market demand. Disputes are believed to be strongly correlated with the fall and rise in market demand for the products produced by the industry. However, there is a problem of finding variables that can suitably capture the market demand. As proxy for demand, variables like sales

TABLE 2: MEAN OF ML, R^2 AND F

Year	Mean of ML
1980	2.36
1981	4.30
1982	2.84
1983	6.26
1984	7.85
1985	4.05
1986	4.75

$R^2 = 0.84$ Adj $R^2 = 0.8$ $F = 29.78$

TABLE 3: ESTIMATES OF INTERCEPT AND COEFFICIENT OF DM

Year	Intercept Estimate	Intercept t-Ratio	DM Estimate	DM t-Ratio
1980	.601	.79	—	—
1981	74	53	8.75	12.82
1982	2.58	1.12	13.49	8.42
1983	3.09	.88	28.47	9.93
1984	10.54	2.61	33.91	10.54
1985	5.69	1.25	—	—
1986	14.92	4.14	—	—

revenue and production figures have been used in the literature. But these variables give rise to serious simultaneity bias as they are correlated with disputes [Fisher (1991) for a discussion on this problem]. Therefore, we refrained from using such proxies and had to be content with fewer variables to maintain consistency in our methodology.

(b) *Model*

Now we present the basic model where variables are both year and industry specific. Ignoring the year-specificity for the time being let us write the basic regression equation for a given year as

$$ML_i = b_0 + b_1 TU_i + b_2 ME_i + b_3 FS_i + e_i, \quad i=1,2,\ldots,N \qquad (1)$$

where i refers to industry and e is the random error term. e is assumed to be normally distributed with zero mean and variance σ^2. Later when the time subscripts will be used, σ^2 will be denoted as σ^2_u for a given t. N is the number of industries. Writing in the convenient vector form, we can suppress the subscript i,

$$ML = b_0 + b_1 TU + b_2 ME + b_3 FS + e \qquad (2)$$

where ML, TU, ME, FS and e are Nx1 vectors. Now in order to identify the model in terms of years, let us add a time subscript t to the variables expressed in vector forms in (2),

$$ML_t = b_{0t} + b_{1t} TU_t + b_{2t} ME_t + b_{3t} FS_t + e_t, \quad t=1,2,\ldots,T \qquad (3)$$

We have covered 19 industries (i e, N=19) for 7 years (i e, T=7) from 1980 to 1986. However, as we mentioned earlier, apart from the above three variables we would like to use a dummy variable (DM) in the years 1981 through 1984 to separate out the effects of textile strikes and similar disputes in few other industries. The variable DM is defined as follows:

In 1981, DM = 1 for Tobacco, Cotton textiles, Jute and Electrical machinery industries,
= 0 otherwise.
In 1982 and 1983, DM = 1 for Cotton textiles and Jute industries,
= 0 otherwise.
In 1984, DM = 1 for Cotton textiles, Jute and Textile product industries.
= 0 otherwise.

Thus we rewrite (3) as

$$ML_t = b_{0t} + b_{1t} TU_t + b_{2t} ME_t + b_{3t} FS_t + e_t, \quad t=1,6,7 \qquad (3a)$$

and

$$ML_t = b_{0t} + b_{1t} TU_T + b_{2t} ME_t + b_{3t} FS_t + b_{4t} DM_t + e_t, \quad t=2,3,4,5. \qquad (3b)$$

For brevity of notations we denote the left hand side (vector) variable as y and combine the right hand side (vector) variables in a matrix x to wrtie them in the familiar matrix form:

$$y_t = x_t \beta_t + e_t, \quad t=1,2,\ldots,7 \qquad (4)$$

where $X_t = [TU_t, ME_t, FS_t]$ or $[TU_t, ME_t, FS_t, DM_t]$ and $\beta'_t = [b_{0t}, b_{1t}, b_{2t}, b_{3t}]$ or $[b_{0t}, b_{1t}, b_{2t}, b_{3t}, b_{4t}]$ depending on t. y_t and e_t are 19x1 vectors. X_t is a 19x4 matrix and β_t is a 4x1 vector for t=1, 6, 7. For all other t, the dimensions of x_t and β_t are 19x5 and 5x1 respectively.

Since we are interested in finding the sensitivity of ML with its determinants not only for a given year, but also over the years, we have pooled our cross sectional and time-series data in a larger model where we can allow changes in intercepts as well as slopes across the years. The estimation technique that we have used is generalised least squares (GLS) (see Judge et al 1988: p 444). The GLS estimates are asymptotically more efficient than the OLS ones. In the present context, the added advantage of the GLS method is that it takes account of the possible excluded factors that may have affected the mandays lost from disputes in more than one year. For example, workers' expectations, government's policy and the employers' union power that affected the duration of the prolonged textile strikes have not been included in the model. But their effects are present in the error term. Since such effects are likely to spill over in other years, the corresponding error terms are also likely to be correlated. The GLS method makes a correction for this problem which was not possible in year to year separate OLS regressions.[2]

After pooling the cross-sectional and time-series data, we write our model as

$$Y = X\beta + e \qquad (5)$$

where Y and e are 133x1 vectors. The number 133 corresponds to 19 observations for seven years. X is a 133x32 block diagonal matrix, where the blocks are given by x_t–s as defined in (4). The coefficient vector β, the dimension of which is 32x1, consists of 32 coefficients which correspond to 7 intercepts, 4 dummy variables and 3 basic variables in all seven years.

The computation of GLS estimates requires estimates of variances and covariances for all seven years. Let us denote the variance-covariance matrix as Σ, a typical element of which σ^2_{tt}. Σ is a 7x7 matrix. Consistent estimates of σ^2_{tt}–s are obtained as

$$\sigma^2_{tt} = \frac{\sum_{i=1}^{N} \hat{e}_{it}\hat{e}_{it}}{N^*}$$

where

$$N^* = N - \frac{\sum_{t=1}^{T} k_t}{T} = 19 - \frac{32}{7} = 14.43$$

k_t being the number of regressors in the t-th year. Since different equations have different number of regressors, an average number of regressors can be used for all equations to obtain the consistent estimates of variances and covariances. The estimates of the error terms $\hat{e}_{it}$, are obtained from OLS regressions. These estimates are also unbiased when each equation uses the same number of variables [Judge et al 1988: p 452]. The resultant estimates of the variance-covariance terms are collected in the matrix $\hat{\Sigma}$.

The GLS estimator for β is

$$\hat{\beta} = [X'(\hat{\Sigma}^{-1} \otimes I)X]^{-1} X'(\hat{\Sigma}^{-1} \otimes I)Y$$

where $\otimes$ is the Kronecker product sign and I is a 19x19 (i e, NxN) identity matrix. Applying the Kronecker product method, each term of $\hat{\Sigma}^{-1}$ is multiplied by the 19x19 identity matrix and the resultant matrix $(\hat{\Sigma}^{-1} \otimes I)$ reaches a dimension of 133x133. The numerical estimates of β are reported and discussed in the next section.

Results

(a) *Positive Relationship with Dummy Variable*

The estimates of the coefficients of the variables and other relevant information are presented in separate tables for the ease of reading although they are obtained from a single regression as discussed in the preceding section. The mean values of ML which will be used in the discussion of the regression results are reported in Table 2. The value of the F statistic and R^2 as shown in Table 2 confirm that the explanatory power of the model is satisfactory.

Now let us discuss the estimates of the coefficient of the individual variables. The dummy variable, DM, used in the years 1981 through 1984, is significant and positive (Table 3). Its estimate shows a steady increase from 1981 to 1984. This has special relevance for cotton textiles, jute and other industries for which the dummy variable is used. For such industries, the regression equation predicts a level of mandays lost per employee, substantially greater than that for other industries. The difference is given by the estimates of the coefficient of the dummy variable. For example, in 1984, for the cotton textiles, jute and textile product industries, the level of mandays lost ignoring the effects of other variables is estimated to be 44.45 (intercept + coefficient of dummy) mandays, whereas the same figure for other industries is only 10.54. The large difference between the two levels is consistent with the fact that the textiles industries witnessed prolonged disputes during this period. It is noteworthy that the estimate of the intercept shows an increasing trend for all industries barring textiles and few other industries for which the dummy variable is used. For such industries the intercept term increases up to 1984 and then declines.

(b) *Negative Relationship with Degree of Trade Unionisation*

One of our main finding is that the degree of trade unionisation, TU, bears significant and in general negative relationship with mandays lost per employee. Except in 1980 and 1985, the variable TU maintains a negative sign. In economic terms, the estimates indicate that if the degree of unionisation in an industry increased by 0.1, the mandays lost per employee would have decreased by .427 in 1981 (for example) and by 3.85 in 1984 (Table 4). These reductions can be regarded as substantial when we note that the average mandays lost was 4.30 in 1981 and 7.85 in 1984.

Interestingly, the variable reveals a curious pattern. Its magnitude increases from 1981 till 1984,and after 1984 it falls in 1986 barring the year 1985 when the variable is insignificant and positively signed. The year 1984 is important in many respects. It recorded the second largest mandays lost from overall disputes and strikes, in particular, between 1976 and 1988 (Table 1) and in this year some important amendments of the ID Act came into force. This can have an effect similar to structural break which is appearing not only in the variable TU but also in FS and ME.

The negative sign of the coefficient runs counter to the popular perception that trade unions are responsible for industrial disputes. Although one can expect positive correlation between strikes and unionisation on the ground that more unionised workers are capable of carrying out a threat of strike, sometimes a credible threat of strike can itself be deterrent against its own realisation essentially by making the employers more willing to negotiate. Moreover, employers also may find it difficult to declare lock-outs when confronted by strong trade unions. Therefore, the relationship between unionisation and mandays lost from disputes can be negative.

One can suspect that from 1982 onwards, when the mandays lost from lock-outs achieved and stayed at a high level, the attempts to impose lock-outs or continue for a longer period were probably thwarted in more unionised industries, which in turn justifies the negative sign of the variable TU. However, we would like to add a qualification. One factor that can, to some extent, accentuate the negative relationship is the presence of casual or badli workers who actively participate in disputes and are not necessarily reported as union members. In the jute industry, for example, 43.8 per cent workers are casual. This makes the reported degree of trade unionisation much smaller than what it is. Since the jute industry had a large share in industrial disputes, the estimates might have been affected by such problems.

(c) *Positive Relationship with Average Factory Size*

The second most important finding is that mandays lost per employee increase with average factory size (FS) in an industry. The variable is positively signed for all years except 1980 and it is not significant only in 1981 (Table 5). The estimates of the coefficient of FS can be interpreted in the following way. If the average factory size increased by 10 employees, then in 1986 (for example) ML would have increased by .042. Now given that the average mandays lost over all industries in 1986 was 4.75, the increase of .042 constitutes approximately 1 per cent. It

might appear from similar calculations for other years that the sensitivity of this variable is very weak and to exert a noticeable effect on mandays lost per employee, factory size has to increase substantially However, we should note that in an industry employing thousands of employees, such small increases in per capita terms will translate into a large increase in aggregate

Like TU, this variable also shows the same pattern with its estimate increasing till 1984 and then decreasing afterwards Thus 1984 seem to be providing a break in the pattern of sensitivity of MI with its determinants We should mention that this is not a result of using a dummy variable for 1981-84 In an experimental regression where we used the same model excluding the dummy variable the same pattern was observed but with different magnitudes of the estimates

The economic implication of the estimates of the coefficient of FS is that in industries dominated by large factories disputes which are supposed to follow a formal course because of various employment regulations, seem to continue for a longer duration than in industries dominated by small factories Since labour in small factories is hardly regulated our result casts doubts on the efficacy of disputes acts and employment regulations as deterrent to disputes

There may be a number of reasons which can explain the positive association between ML and FS First, in large factories because of a bigger workforce and complexity of management, the issues bearing potential for conflicts are manifold Secondly, protected by income and employment security under IE and ID Acts, workers may not have an incentive to settle the dispute early before referring it to government mediated reconciliation Thirdly, similar tendency can also be present among the employers As we have explained earlier, prolonged lock-outs can be used as a means of rationalising labour

(d) *Weak Relationship with Average Monthly Earnings of Employees*

Unlike the other two variables the average monthly earnings of an employee appears to be a weak variable It is significant only in two years—1981 and 1986—and of the estimates in these two years, one is positively signed (in 1981) while the other has a negative sign The estimates indicate that this variable, when significant, can be said to have strong effects on ML For example, consider the estimate of the coefficient of ME in 1986 If average monthly earnings increase by Rs 100 mandays lost per employee would decrease by 55 which constitutes a share of 11 per cent in the average mandays lost in 1986

What is interesting about this variable is that its sign follows almost the same pattern as the data on industrial disputes Industrial disputes data show an increasing trend up to 1984 and after that the trend declines The variable is positively signed for all the years except 1982, till 1983 and then switches into a negative sign This shows that a negative relationship between wages and mandays lost from strikes obtained in Ashenfelter and Johnson (1969) and Abbott (1984) may not be extended to wages and aggregate disputes Although better paid workers are believed to be having fewer reasons to go on strikes their managements may have an interest to launch a lock out to save on labour costs or to make the worker accept a wage cut Therefore positive relationship with mandays lost from disputes and employees' earnings is also possible

(e) *Combined Effects of Exogenous Variables*

The individual effects of the degree of trade unionisation and average factory size are found to be opposing each other while the average monthly earnings of an employee although showing poor statistical significance shared its effects first with the average factory size and later with the degree of trade unionisation The net yearwise effect is a result of an interplay of these variables The combined effect of these variables can be used to relate to the pattern of disputes in the 80s Mandays lost from disputes showed a declining trend from 1984 after reaching a height in the early years of the 80s In 1980 the degree of trade unionisation and employees' earnings had dominant effects Then up to 1984 the effects of employees' earnings, factory size and the special problems associated with cotton textiles and jute industries played dominant roles in generating an increasing profile of disputes After 1984, monthly earnings and unionisation probably played a role in reducing industrial disputes

VII
Conclusion

The present paper has tried to identify some of the determinants of industrial disputes using an econometric model While trade unions have been found to have exerted a declining pressure on disputes, large factories are seen to be prone to much longer disputes However, our model has excluded some important variables such as employers' unions and market demand We also have not distinguished between industrial disputes in the private and the public sectors For more satisfactory modelling one should not only include such variables but also look at strikes and lock-outs data separately Furthermore the model should be applied with more disaggregated data Nevertheless we believe that our model has found some interesting results which can be utilised to evaluate disputes acts and employment regulations

Notes

[We would like to thank Kirit Parikh for suggesting a normalisation which we have used in the empirical specification of the model Anindya Sen and Shubhashis Gangopadhyay made some comments on an earlier version of the paper We also thank Soumen Majumdar for helping us write a computer programme which has been used in the estimation part of the paper Any remaining errors are our responsibility]

1 Our data correspond to the following industries food products tobacco cotton textiles, wool and silk jute and hemp textile products, wood and furniture paper leather rubber chemicals non metallic minerals metals and alloys metal products machine tools electrical machinery transport equipment, other manufacturing industries electrical and gas and water

2 OLS estimates are found to be slightly different They are upwardly biased for TU, DM and almost so for ME But for FS OLS estimates are lower The variables TU and ME show a change of signs for one year each in 1980 and 1983 respectively The levels of significance improve with GLS estimates for the variable FS

Managing exports in a multilateral world

By S. M. Datta, Chairman, Hindustan Lever Limited

BALANCE OF INDIA'S TRADE

Over the previous decade, India's foreign trade had operated at a steady deficit of around $ 6 billion every year. Trade deficits, particularly in such modest degrees, are not uncommon in developing economies because export revenues are often overtaken by the growing need for capital goods, components, ingredients and, in most cases, of energy imports as well. The deficit is usually neutralised by surpluses in invisible flows such as Tourism and Remittances. The particular cause of worry in our situation was the unfortunate combination of this recurring trade deficit with a very low level of invisibles inflow and the rapidly rising burden of servicing our debts.

However, a sea-change has taken place following the overhaul of India's foreign trade policy which started in early 1992 almost simultaneously with measures to restructure the economy. The initial devaluation of the Rupee has helped to improve the competitiveness of India's exports, despite its subsequent strengthening against European currencies. The Rupee-denominated Russian trade has collapsed but the new debt servicing arrangements are beginning to take hold, giving rise to hopes of an early resumption. The complex system of export subsidies is being gradually dismantled, thereby shifting the emphasis from system manipulation to market development, and volume growths are taking place despite the trauma of the initial adjustments. Although the economy, particularly its manufacturing sector, grew at a slow pace in 1992 and 1993, exports have surged ahead by an estimated 20 per cent in 1993-94. The trade gap has narrowed considerably to $ 3.3 billion in 1992-93 and an estimated $ 0.7 billion in 1993-94. The reduction in the trade gap has been accelerated by the sharp decline in imports following the disappointing growth in industrial production.

Imports do contribute to economic growth by facilitating industrial output and consequent value-addition to primary products. Judicious imports of intermediates and consumer goods help supplement domestic output to stabilise prices and thereby stimulate demand. In energy-deficient countries like India, energy imports keep the wheels of industry and transport moving. Thus, imports are an essential component of any modern economy and exports become necessary only to pay for purchased goods and services. India's moderately high foreign debt, which, at the present level of $ 85 billion, amounts to nearly 30 per cent of the Gross Domestic Product (GDP), places an additional demand on exports to finance the debt servicing requirements.

The much-discussed GATT negotiations have signalled a step-jump in the volume of world trade by as much as $200-300 billion a year, and some of this growth will arise in the very sectors where India has a latent strength

PROSPECTS FOR GROWTH

The volume of India's exports is quite modest. The average annual level of $ 18 billion achieved in the last five years amounts to only 6 per cent of the national GDP and less than 0.5 per cent of the world's export trade. China, the neighbouring giant, has an economy not much larger than ours and yet manages to export over $ 100 billion worth of goods and services. Admittedly, the proximity to the entrepot trading hub of Hong Kong gives China an enormous advantage over India but it should not be too difficult to double India's export volume within two years and maintain an annual growth rate of 15 per cent thereafter. This would enable us to tide over the debt servicing problems of the coming three years and yet have the surplus to finance the imports needed to stimulate the domestic economy. Should this proposal appear too ambitious, we have only to recall that the resultant increase in export revenue over a five-year period will only equal the current annual increase in China's exports.

Potential in agri exports

The probable sources for this growth in exports are easily discernible. Agriculture accounts for nearly 30 per cent of the Gross National Product (GNP) but provides only a sixth of the total exports and that too mostly in specialised areas such as oilseed extractions and tobacco. Out of the total value of our agricultural produce, about 40 per cent comes from cereals, about 12 per cent from fruits and vegetables and about 7 per cent from sugarcane. These areas witnessed some policy relaxation in 1993-94, and as a result, during the April-December period, exports of rice recorded a value increase of 28 per cent, and sugar/molasses export value went up by 123 per cent. As

India establishes its reputation as a reliable exporter of quality agricultural produce, access to the markets to semi-processed and processed foods would become easier and the value-addition will increase at an accelerated pace.

Textiles, garments and leather products

Textiles and garments will provide the second most important opportunity for enhancing exports. Garments already account for nearly one-eighth of our total exports and faster growth has been held back as much by the quota system under the Multi-Fibre Agreement as by the low productivity of the cotton crop and the average underdeveloped status of our textile industry. Exports of manufactured leather products have made rapid progress in recent years despite the unorganised status of the domestic industry and now accounts for 7 per cent of our exports. A properly planned reorganisation of our animal husbandry sector and of abattoirs would undoubtedly help leather exports grow but even otherwise the industry is now mature enough to handle imports of raw hides and semi-processed leather for further value-addition.

Export of services

The significant size of India's pool of technically trained and skilled manpower base and the diversified nature of its industry and services hold the promise of a rapid growth in exports of services. The financial sector in India has the requisite size and potential to lead this drive provided the efficiency and the productivity of the sector is rapidly upgraded and modernised by the quick implementation of the reform measures outlined in the recommendations of the Narasimham Committee and the Malhotra Committee. Similarly, the excellent scientific and technological research capability already available in India would provide another avenue for services exports after the patent laws are suitably harmonised.

The foregoing examples are meant to illustrate the immense potential for growth in the value of India's exports, which will generate the resources for investment in an economy growing at an accelerated pace. But these value growths will have to take place in a situation where the principal markets, represented by the OECD countries, have been suffering from economic stagnation for a number of years. More importantly, India will have to compete for its share of this market with China and the South-east Asian countries, who are admittedly more adept at this game. However, there are three hopeful developments which could provide relief. First, democratic pressure for better economic performance in the G-7 countries has brought about a significant change in their national priorities. The governments of these countries are now committed to policies which will lead to economic growth, and some are already showing signs of a return to sustained growth. Second, the agenda of the developing countries, as represented by the G-15, is shifting from the political sphere to the economic arena, and the scope for improving South-South trading relations is coming under greater scrutiny. The recent liberalisation in South Asian trade is a case in point. Third, the conclusion of the much-discussed GATT negotiations have signalled a step-jump in the volume of world trade by as much as $ 200-300 billion a year, and some of this growth will arise in the very sectors where India has a latent strength.

INDIA'S EXPORTS AND GATT

The General Agreement on Trade and Tariffs (GATT) was established as an international forum in 1948 by 23 signatories, among whom 11, including India, were developing economies. The objective of GATT was to create a World Trade Organisation (WTO) which would oversee the smooth conduct of world trade and prevent the trade-originated conflicts commonly encountered in the pre-War years. The plan to establish the WTO has been long delayed by persistent opposition from the US Congress but it is now likely to materialise very soon. The essential benefit of GATT arises from the commitment to extend Most Favoured Nation (MFN) status to all the signatories and to provide equal treatment to all members. This explains the rapid increase in the number of signatories from the original 23 to the current level of 125.

The new treaty will provide increased market access to all the members, the brunt of which will, naturally, be borne by the largest economies of the world who will share most of the pains, as well the gains, arising from the entirely desirable outcome. The rapid rise of Japan's economic power behind the high wall of rigid protectionism has, meanwhile, tempered the free-trade idealism of the immediate post-War years among the Western democracies who are now genuinely concerned about their ability to compete and survive in the world market and thereby sustain their living standards. This underlying worry has triggered the aggressive responses from, for example, France and the United States. Admittedly, the special and differential treatment extended to developing countries under the original agreement has been watered down to some extent in the revised treaty but the focus will continue to be on the sharing of the G-7 markets among the various economically developed nations.

From the viewpoint of India's factor advantages in agriculture, textiles, leather and services, the new treaty provides significant gains which outweigh by far the balancing concessions. In agriculture, physical barriers will be replaced by tariff barriers which will be reduced by an average of 36 per cent over six years in the case of developed countries, and by an average of 24 per cent over 10 years in the case of developing countries. India will not have to comply with the provisions regarding subsidies, be-

cause these are already less than the prescribed minimum levels. Even the market access provisions will not apply, at least until the balance of payment situation improves. The reduction of subsidies and non-tariff barriers in industrialised countries promises to open the way for agricultural exports from India. In textiles, the Multi-Fibre Agreement will be absorbed into the new treaty over a 10-year period. It will be a slow process, because merely 49 per cent of the quotas will be abolished in the first nine years, and the rest will disappear only in the last year. But this slow release could very well act in India's favour if steps are taken to improve the quality and cost levels in the garment industry to match those of South-east Asian countries within the first few years. In services, India should win greater access for the movement of professional people, which will lead to higher export earnings in several areas such as computer software and consultancy. On the other hand, India may have to grant greater access in financial services and telecommunications. The latter could become a major worry if the standards of efficiency and services in the Indian industry are not improved speedily. Now that the USA has agreed not to press for the immediate consideration of the social clauses, the treaty will not affect two other areas of major export potential, namely, leather, and gems and jewellery.

STRATEGY FOR EXPORT GROWTH

The conclusion of the GATT negotiations marks the endorsement of the concept of Managed Trade by its members. In this environment, it would be easier to achieve the export growth objectives by first selecting a number of limited targets and then creating a joint government-industry effort to exploit the country's natural competitive advantages where they exist and to create factor advantages through concerted action when such natural factors are absent. Industry is perhaps too wide a term to be used in this context because such focused activity can take place only at the enterprise level. This is essentially the model which Japan had used to drive its productivity and competitiveness to world status in sectors like electronics and automobiles, while leaving some of their consumer goods industries in a relatively unsophisticated state. According to press reports, the Indian Space Research Organisation has also adopted this approach to progress the missile programme. The model, therefore, is demonstrably applicable in the Indian environment.

Despite the drastic changes in the Government support policy, the disappearance of the Rupee-denominated Soviet trade and the consolidation of business portfolios, Hindustan Lever has increased its export revenues from Rs. 162 crores in 1990 to Rs. 255 crores in 1993

The developments in our socio-political milieu in the last four decades would, however, make it extremely difficult to introduce the much needed prioritisation in our export efforts through the prior selection of the possible winners. This task was attempted by the Board of Trade two years ago and it ended by picking up as many as 39 extreme focus areas. In this situation, the government can only adopt a backstage role for effectively accelerating the development of major export capabilities. This way, enterprises can be gently persuaded to move in the desired direction without significantly distorting the fiscal and the regulatory regime in favour of one or the other segment.

Administrative support and direction should generally occur under four major headings. Among these, the creation of the right policy environment is the most crucial one which the government needs to provide. The development of mainline agricultural exports, for example, will require the removal of restrictions on movement, refashioning the minimum export price systems and enabling enterprises to carry out the necessary background development work without major hindrance from the land ownership procedures. In the case of textiles, the entire gamut of activities must be reviewed, starting with the development of hybrids, the procurement and export of cotton, the spinning and weaving of mono- and multi-fibre fabrics and the restrictions on the development of the organised sector garment industry. Most export operations need imported inputs on grounds of quality and economy, and as long as the Rupee continues to be convertible within narrow limits, we must pay attention to facilitating the supply logistics through appropriate procedural changes. Similarly, the flexibility needed in servicing export markets requires a corresponding removal of rigidities in the associated capital and labour markets.

Focus on productivity and quality

It is now widely accepted that quality and productivity are the two most essential criteria needed to ensure competitive advantage in all markets and, more particularly, in export markets. Improvement of quality and productivity requires the guided and directed adoption of new technology, as well as its subsequent upgradation through continuous innovation. For example, in agricultural technology, we have to examine not only the development of varieties and hybrids along with a clear definition of the desired package of agronomic practices, but we must also attend to technological

issues like irrigation, fertiliser application and pest control consistent with world standards on chemical residues, and post-harvest storage and handling. In textiles, the necessity for improving our technology base in spinning, weaving and processing is now well understood but the technically backward handloom and powerloom sectors are also in need of urgent technology inputs not only for improving quality and productivity but also to conform to the social clauses which will definitely come into play in the near future.

Making the infrastructure robust

The importance of the physical infrastructure in promoting industrial competitiveness is undeniable but so far our attempts to guide public investment into such areas have met with indifferent success Now that private capital is being gradually inducted into the infrastructure sector, it would be worthwhile pondering whether the initial efforts would be better directed at the selective development of regions with direct linkage to ports, where handling facilities can be dramatically improved without confronting the powerful labour lobby. Needless to say, such directed development must also carefully sidestep the somewhat contrary policy situation with respect to Export Oriented Units and Export Processing Zones.

Fiscal and financial incentives are prominent among the various persuasive mechanisms that governments, both central and state, have liberally used for directing and guiding the development of industries and enterprises. The GATT treaty provides ample scope for non-specific incentives and these should continue to be used judiciously to encourage investment in exports as well as to compensate for the transactional hurdles and costs which still haunt Indian industry.

EXPORTS IN HINDUSTAN LEVER

When Hindustan Lever started developing its export business over 30 years ago, its objective was to create a sustainable stream of foreign exchange earnings which would be large enough to finance the needs of the growing business. During the decade of the 80s, this was overlaid by an element of compulsion imposed by the Foreign Exchange Regulation Act. This pressure has now been lifted and the original objectives are now back in full force Meanwhile, the stagewise relaxation of controls on the import trade are opening up new business opportunities which, in turn, call for the generation of larger export revenues. Therefore, despite the drastic changes in the Government support policy, the disappearance of the Rupee-denominated Soviet trade and the consolidation of business portfolios, Hindustan Lever has increased its export revenues from Rs. 162 crores in 1990 to Rs. 255 crores in 1993 while maintaining the net foreign exchange earnings at a minimum level of 80 per cent. This 17 per cent growth rate has been achieved through a carefully modulated programme of investment in manufacturing and quality, the development of new markets and international partnerships, and the establishment of brand names in the international market.

In Services, India should win greater access for the movement of professional people, which will lead to higher export earnings in several areas such as computer software and consultancy

The direction of India's export trade in the post-Marrakesh period is likely to move in favour of primary commodities and their downstream products, as well as textiles and leather derivatives. Over the years, Hindustan Lever has built up a strong presence in the export of commodity agri products and has been successful in establishing a truly international brand in Indus Valley, which is now being extended across a range of food products. Additionally, it has built up a successful international sourcing business in garments and leather products. Three new projects, one in speciality leather and leather products, a second in sweet water aquaculture and a third in value added marine products will be commissioned this year. These projects will generate significant additional export volumes and accelerate the growth in export earnings. When deployed to procure raw materials and ingredients, these foreign exchange earnings will improve the quality and reduce the manufacturing cost of the products sold in the domestic market.

Over the past four decades, India has developed an extensive and highly diversified industrial base but only at a very high cost, arising from insufficient technology inputs and needing the protection of a very high tariff barrier. The New Economic Policy aims to replace the import substitution regime by a self-financing strategy for imports which is robust enough to stand up to international competition. The success achieved by this strategy in the just concluded financial year should encourage the policy makers to remove the many anomalies which still persist. The GATT treaty will ultimately lead to an emphasis upon strength and competitive ability in the domestic market as the basis for enhancing exports. The well diversified export manufacturing base established over the years in Hindustan Lever holds the promise of a flourishing growth in its export performance under the influence of the New Trade Policy.

This is the text of the speech delivered at the Annual General Meeting of Hindustan Lever Limited held in Bombay on April 22, 1994 If you wish to obtain this speech in booklet form, please write to: The Communications Department, Hindustan Lever Limited, P O Box 409, Bombay 400 001

Situations/HLL/01/94

Food Security in South Asia

Performance and Prospects

P S George

The prospects of south Asian countries achieving food security during the coming decades will depend on a number of simultaneous measures towards increased food production especially through technological change, population control, creating adequate buffer stock and target-oriented programmes for the poor.

THE concept of food security has undergone substantial changes during nearly two decades starting with the World Food Conference of 1974 which was organised in the wake of the world food crisis of 1972-74. In the early years food security implied arrangements for providing physical supply of an adequate minimum level of foodgrains for the population in the developing countries during years of normal as well as poor harvests [Andersen 1985, Sarris and Taylor 1976, Gale 1976, Valdes 1980, Konandreas 1975, George 1985]. However, it is now recognised that the ultimate aim of food security is not only provision for the physical availability of adequate amounts of foodgrains for the entire population on a stable basis throughout the year, but also to assure that all population including the poor and vulnerable sections have economic access to foodgrains [Bhalla 1993, Sarma 1992]. This also implies that satisfactory production levels and stability of supply should be matched by a reduction in poverty and an increase in the effective demand to ensure economic and physical access to food for the poor [FAO 1987]. This paper reviews the experience of food security in south Asia with special reference to Bangladesh, India, Nepal, Pakistan and Sri Lanka during the last two decades and makes some observations on the perspectives during the next two decades.

The countries in south Asia have a number of common features such as high man-land ratio, large share of agriculture in gross domestic product, high proportion of labour force in agriculture, weak infrastructure, low per capita income and a high proportion of population below poverty line [Tyagi and Vyas 1990]. The region is also characterised by relatively poor natural resource endowment especially good quality land, low labour productivity, low level of yield per unit of land and slow growth in cereal production during the 60s. Following the land utilisation policies influenced by the colonial regime and the severe food crisis in the 60s and early 70s, there is an emphasis on achieving self sufficiency in foodgrain production. Rapid population growth and increased income levels during this period has contributed to a substantial increase in food consumption requirements, which could not be met in full due to slow production growth and inability to import food on account of unfavourable foreign exchange position. Most of these countries have a high incidence of rural and urban poverty. It is estimated that south Asia which accounts for about 30 per cent of the population of the developing world accounts for about 47 per cent of the poor in the developing world [Islam 1992]. Most of these countries have some form of intervention in the foodgrain markets to increase the food consumption levels of the vulnerable segments of the population.

Food Production Trends

During the last two decades south Asian countries have witnessed some major changes in food production. The annual growth rate in Bangladesh remained more or less the same during 1970-79 and 1980-91. Both India and Pakistan had improved the annual growth rates during these two periods (in India the increase was from 2.68 per cent to 3.84 per cent and in Pakistan it increased from 3.15 per cent to 4.10 per cent). Nepal and Sri Lanka had experienced substantial changes in the growth rates. While Sri Lanka had the highest annual growth rate in the region (4.03 per cent) during 1970-79, it had the lowest growth rate (0.09 per cent) during 1980-91. On the other hand, Nepal had an impressive performance where the annual growth rate increased from the lowest level of 0.62 per cent during 1970-79 to the highest level of 4.75 per cent during 1980-91.

A comparison of the growth rates of population and food in these countries indicate that in spite of the high population growth during the 70s the growth rate of food production in India, Pakistan and Sri Lanka exceeded the population growth rate, but food production growth rate lagged behind population growth rate in Bangladesh and Nepal. During 1980-91 also the situation was the same in Bangladesh, India and Pakistan, but Nepal improved the position with food production growth rate exceeding population growth rate and Sri Lanka moved in the opposite direction. In terms of per capita food production there was a negative growth rate in Bangladesh and Nepal during 1970-79 but during 1980-91 growth rate of per capita food production was negative in Bangladesh and Sri Lanka.

Cereals accounted for the bulk of food energy intake in south Asia. During the 70s, the growth rate of cereal production lagged behind population growth rate in Nepal only. However, in the 80s the growth rate of cereal production in Nepal was higher than the population growth rate, but the opposite situation prevailed in Pakistan and Sri Lanka, which is a matter for serious concern. A summary of the relative position in relation to population, food and cereals is available in Table 1 and the details are presented in Appendix 1.

Table 1: Growth Rates of Population, Food and Cereals

	Food		Cereals	
	1970-79	1980-91	1970-79	1980-91
Bangladesh	–	–	+	+
India	+	+	+	+
Nepal	–	+	+	+
Pakistan	+	+	+	–
Sri Lanka	+	–	+.	–

(+) Production growth rate above population growth rate.
(–) Production growth rate below population growth rate.

Table 2: Dominant Factor Responsible for Growth of Cereal Output

	1970-79	1980-91
Bangladesh	Y	Y
India	Y	Y
Nepal	A	A
Pakistan	Y	Y
Sri Lanka	A	Y

(A) denotes area; (Y) denotes yield.

An analysis of the factors contributing to production increase of cereals indicates that during both 70s and 80s improvements in yield accounted for the major share of the increase in Bangladesh, India and Pakistan. In Nepal during both these periods increase in area contributed to the major share in production increase. In Sri Lanka, area expansion was the dominant factor during the 70s, but during the 80s there had been no increase in area and all the production increase was accounted by yield (Table 2).

The growth rates of area under cereals presented in Appendix 1 indicate that during the 70s, the annual growth rate in area under cereals ranged between 0.58 per cent in Bangladesh and India and 4.22 per cent in Sri Lanka. However, in the 80s there was a small negative growth in area under cereals in Bangladesh, India and Sri Lanka. Nepal had the highest growth rate of 3.12 per cent. Pakistan had a positive growth rate of 0.84 per cent which was below the rates for the 70s. During the 70s the annual growth rate of yield of cereals was negative in Nepal and Sri Lanka (-1.26 per cent and -1.22 per cent). Though both these countries have recorded positive growth rates of yield during the 80s, the absolute levels were still low at 1.42 per cent in Nepal and 0.98 per cent in Sri Lanka. Bangladesh and India have improved the growth rate of yield during these two decades, but Pakistan has indicated a decline in the growth rate of cereal yield from 2.63 per cent during the 70s to 0.89 per cent during the 80s. Thus the extensive phase of agricultural development has ended in south Asia, with the possible exception of Nepal. While the intensive phase has begun in Bangladesh, India and Pakistan in the 70s, there are doubts about Pakistan's ability to sustain the growth rates achieved. Nepal and Sri Lanka are yet to achieve major increase in yield levels.

To achieve the desired effect of food security through stability in consumption levels, it is important to achieve some level of stability in domestic production levels, especially since the other options of trade and aid may have only limited scope in the south Asian region. The variability in area, yield and output of cereals during the 70s and 80s was analysed using the coefficient of variation. The result of this analysis presented in Appendix 2 and the summary in Table 3 indicates that the variability in output of cereals increased during the 80s in Bangladesh, India and Nepal and it has declined in Pakistan and Sri Lanka. The increase in the variability in Bangladesh and Nepal was associated with increase in the variability of both area and yield, but in the case of India yield variability was solely responsible for increased output variability. The decline in the output variability in Pakistan and Sri Lanka was associated with reduced variability in both area and yield.

Table 3: Changes in Variability of Area, Yield and Output, 1970s to 1980s

	Area	Yield	Output
Bangladesh	+	+	+
India	–	+	+
Nepal	+	+	+
Pakistan	–	–	–
Sri Lanka	–	–	–

(+) indicates increased variability in the 80s
(–) indicates reduced variability in the 80s

Table 4: Percentage of Population Fulfilling FAO Nutrition Requirements

	1972-74	1978-80	1984-86
Bangladesh	80.3	79.9	83.2
India	91.5	96.2	99.7
Nepal	87.5	90.5	93.2
Pakistan	89.1	95.2	97.1
Sri Lanka	97.0	102.4	109.6

Food Consumption

Food availability within a country is determined by local production, changes in stock and net effects of trade and aid. It is generally expected that variability in consumption is likely to be less than the variability in production as a result of adjustments in stock levels and trade. Among the south Asian countries, India and Pakistan had maintained large quantities of grain reserves from internal procurement. Though there is an argument that such reserves tie up capital needed for infrastructure development, there are strong arguments in favour of building up reserves on the ground of food security and stability of farm income.

While data on production of food items in the south Asian region are readily available, there is a paucity of data on consumption mainly due to the difficulty in obtaining reliable data on stock changes. However, it may be noted that during the 70s and 80s, south Asia witnessed a satisfactory record of growth in foodgrain production. Imports have not played a major role in the net availability except during a few years of acute scarcity. Further there is a decline in the quantities of foodgrains received under food aid. With the exception of a major famine in Bangladesh during 1972-73, there was no serious food insecurity, which can be considered as a famine situation, in the south Asian region in the past two decades.

In spite of the fact that food production growth rate exceeded population growth rate in most of the countries in this region, the average food consumption levels in some countries are very low. During 1972-74, none of the countries under consideration had met the normative daily per capita energy requirements specified by the FAO. However, by mid-80s there had been substantial improvements so that Sri Lanka had exceeded the requirements by 10 per cent and the shortfall was only marginal in India and Pakistan. Bangladesh and Nepal were still not able to meet adequate energy requirements.

The average energy intake is a poor measure of food security, especially in the context of a large segment of the population remaining below poverty line. It is estimated that the proportion of population below poverty line ranged between 24 per cent in Pakistan and 51 per cent in Bangladesh [Islam 1992] and it is this category that suffers most on account of instability in food availability. Most households below the poverty line are facing serious food insecurity. While it is often recognised that the long-term solution for food insecurity of poor households is to provide them adequate employment and income opportunities, there are practical difficulties in getting quick results from growth-oriented income policies. The countries in the south Asian region have implemented three broad categories of programmes, viz, labour-intensive public works programmes, market intervention programmes and special feeding programmes [Von Braun 1992]. Both Bangladesh and India have implemented programmes for creating durable assets through public works programmes that em-

Appendix 1: Growth Rates of Population and Production

ployed rural poor. Market intervention programmes that originated during the second world war were continued in India, Bangladesh and Pakistan in the form of fair price shops, target-oriented food subsidies and public distribution system. Sri Lanka had also introduced a food stamp programme. Direct feeding programmes, especially for the vulnerable segments of population such as children and pregnant women, are common in most countries in the south Asia region. High cost, leakages and other administrative problems associated with these programmes have often come in the way of providing full benefits to the needy population.

Prospects of Food Security

Based on the developments during the last two decades it is possible to make some observations on the prospects of food security in south Asia during the coming decades with reference to physical availability, instability and achieving household food security by the vulnerable sections of the population.

On the aggregate demand side, population and income growth are two important factors contributing to the growth of food demand. According to speculative estimates of the World Bank [World Bank 1993], Sri Lanka would achieve a net reproduction rate of one by 2000, Bangladesh and India by 2015, and Pakistan and Nepal by 2030. The UN population projections [United Nations 1991] indicate that the annual growth rate will range between 1.20 in Sri Lanka and 2.81 in Pakistan during 1990-2000 and between 1.03 in Sri Lanka and 2.35 in Pakistan during 2000-2010. Thus by the turn of the century all countries other than Sri Lanka will have an annual population growth of around 2 per cent or more. The average annual growth rate of per capita GNP during 1980-91 ranged between 1.9 in Bangladesh and 3.2 in Pakistan. Assuming an income elasticity of around 0.4 for food, it is likely that the effective demand for food would grow by 3-4 per cent per annum. If the poverty alleviation programmes initiated in this region achieve the desired goals, the growth in demand would be of a much higher order. Since it is unlikely that most of these countries would generate adequate foreign exchange reserves to finance sizeable commercial import of food and that food aid is becoming less important, increased efforts should be made to step up domestic food production. In the context of limited opportunity for expanding land available for food production, most of these increases should come from increased yield per unit area of land through improved technology. Thus the countries in this region will be required to give more emphasis on yield increasing technologies in order to maintain the growth rate of foodgrains above the population growth rate. Vigorous efforts to step up population control measures could reduce the need for substantial increase in land productivity.

It may be recalled that during the 80s variability in food production has increased. In spite of the emphasis on improvements in irrigation it is likely that in the coming decades variability would either increase with the adoption of new technology or at best it could remain at the level of the last decade. Therefore, measures to stabilise local availability assume special significance. As global measures have not found much relevance in the region, measures at the regional and national levels assume great importance. Though India, Pakistan and Bangladesh have already taken steps to build up national stocks, the infrastructural facilities are not fully developed for storage of adequate buffer stock. From a practical point of view it may be necessary that the countries in the region create adequate food reserves to meet seasonal and annual variability in production levels within a specified limit and depend on regional and global facilities beyond this limit.

It has been established that the impact of household food insecurity is most serious among the vulnerable segments of the population. South Asia which accounts for a large number of population in absolute poverty will be required to continue both direct and indirect measures to alleviate poverty so that food security can be within the reach of these households. Since it is unlikely that special employment and income generating activities alone can meet this challenge within the near future, south Asian countries will have to continue their dependence on measures for subsidised food distribution and direct feeding programmes. However, in order to minimise the drain on the exchequer, such measures should be strictly target-oriented and there should be a plan for phased withdrawal once the desired household food security is achieved. Judging from the past experience of such programmes in the region, it is important to mobilise administrative and political support for such target orientation. The proposed measures of decentralisation and local level decision-making efforts in some of the countries in the region could possibly overcome the problems involved in effective target-orientation.

To sum up, the prospects of south Asian countries achieving food security in the broader sense during the coming decades will depend on a number of simultaneous measures towards increased food production especially through technological change, population control, building up adequate buffer stock, target oriented programmes for the poor and generation of income and employment opportunities.

[This is a revised and enlarged version of a paper presented at the 15th International Congress of Nutrition, September 26-October 1, 1993, at Adelaide.]

Secularism and the Intellectuals

T N Madan

THE last half a dozen years or so have witnessed a heightened interest among Indian intellectuals in exploring the significance of the ideas of 'secularism' and 'secularisation'. This is a welcome development for we have been since independence living on many unexamined or half-examined ideas, which have thus become the 'foundation myths' of our times. Secularism certainly is one of them. Even today it is not clear whether it stands for the rejection of religion as 'false consciousness', or whether it means that the state shall treat the followers of all religions equally, without discriminating against some or favouring others. The ambiguity of connotation is sometimes sought to be overcome by employing the phrase 'Indian secularism' to denote the combination of a multi-religious society and the non-discriminatory state. This and other aspects of secularism merit close and critical scrutiny. Andre Beteille's article 'Secularism and the Intellectuals' (*EPW*, March 5, 1994) is one of the more thoughtful and lucid expositions of the subject that I have read recently. I trust it will generate a useful discussion.

Personally, I agree with the general thrust of Beteille's argument and also with most of the points that comprise it. Some of my emphases would be different, however. Also, I think a few misunderstandings should be removed. This has become necessary because Beteille has constructed his argument partly in response to a lecture entitled 'Secularism in Its Place' that I delivered in 1987 and which was published later that year [Madan 1987]. Since then I have published a number of essays on secularism, fundamentalism and religion [e g, Madan 1989, 1991, 1993], developing my argument which I had introduced in a couple of earlier articles [e g, Madan 1986], but Beteille has not taken notice of any of these except fleetingly of a newspaper article [Madan 1994] Obviously, his interest lies in a particular aspect of my argument rather than in it as a whole, but this has resulted in the misunderstandings I mentioned above.

Let me recall that 'Secularism in Its Place' was written eight years ago at a time when most secularists seemed complacently confident that 'scientific temper', the mantra given by Jawaharlal Nehru, would, if vigorously propagated, fulfil its promise of establishing secularism in India. There were not many intellectuals then who either showed awareness of the limitations of secularism as a worldview or displayed any great unease about the recrudescence of religious fanaticism in the form of communalised politics or fundamentalist movements. Although Punjab was already in violent turmoil and the Shah Bano case had attracted wide attention, the future of the nation, judged by the prevailing discourse on secularism, did not seem to be in greater jeopardy than before. In any case, the remedy was secularism and more secularism. To the best of my knowledge only a few intellectuals had dissented with this dominant discourse, Ashis Nandy [1981, 1985] being the most notable among them.

I myself had begun to feel apprehensive that the secularist discourse tended to underestimate the staying-power of religion in society and also ignored the fact that religion itself could be a powerful resource in the struggle against religious extremism. I did not believe then, and do not do so now, that what needs explaining is religious tolerance rather than its opposite. The invitation to address a special session at the annual meetings of the American Association of Asian Studies, at which Asianists from many parts of the world were expected to be present, afforded me an excellent opportunity to present my views on the prospects of secularism in India. I did so in a deliberately provocative but carefully-worded text, and it did make an impact, although of course not everybody agreed with me.

As Beteille has pointed out, I expressed doubt about the success of secularism as a worldview, as a political ideology, and as a societal blueprint. What he has not done, however, is to cite the reasons I gave for my conclusions. Several other critics have similarly quoted the statement in question in a truncated form [e g, Bailey 1991: 226; Baxi 1992: 89]. The omission is grievous. Let me therefore put the record straight and quote the part of the argument that has been left out by Beteille and the others.

> It [secularism] is impossible as a credo of life because the great majority of the people of south Asia are in their own eyes active adherents of some religious faith It is impracticable as a basis for state action either because Buddhism or Islam have been declared state or state-protected religions, or because the stance of religious neutrality or equidistance is difficult to maintain since religious minorities do not share the majority's view of what this entails for the state And it is impotent as a blueprint for the future because, by its very nature, it is incapable of countering religious fundamentalism and fanaticism [Madan 1987: 748].

It will be seen that what occurs in my text primarily as a statement of the facts on the ground and only secondarily as my interpretation of them, appears, because of partial quotation, as an acerbic ideological attack on secularism. Now, I do have my reservations about this Enlightenment ideology, more so about the received wisdom regarding it, and so have many other scholars [e g, Toulmin 1990]. The statement in question was intended to state some of them and to draw attention to their implications for the Indian political experiment. A couple of my critics have, however, jumped to the conclusion that, since I have reservations about secularism as presented in the prevailing discourse, I must therefore be a supporter of communalism. This is patently absurd.

To return to the lecture itself, I had cautioned dogmatic secularists that in a democracy it is not easy for a minority to impose its will upon the majority. Beteille has referred to this argument also. There is, however, a double misunderstanding here. First, I did not say that the secularist minority was trying to impose secularisation upon the majority: what I mentioned specifically was the ideology of secularism. I agree with Beteille that it is 'useful'—I would say it is imperative—to distinguish between secularisation (in Beteille's words, "a social process that unfolds itself on its own, as it were") and secularism ("an ideology that some members of society strive consciously to espouse and promote"). I myself have made this very distinction several times over in my writings. For instance, I distinguished between secularisation as a 'process' and as a 'thesis' in the 1994 newspaper article to which he refers. I agree with him that not all of the secularisation that has occurred in Indian society "has been the work of a minority of intellectuals determined to impose their will on unsuspecting masses of people" [Beteille 1994: 560]. I do, however, maintain that those intellectuals who proclaim that religion is not only a 'fake' but also necessarily evil, and therefore present secularism as a morally superior soteriology, are trying to impose their will on the people.

Beteille makes a further point, namely, that "those who wrote [the Indian] Constitution were more representative [of the Indian people] than the authors of the Dharmashastras" (ibid). This is obviously true, but my argument was not about the representativeness or otherwise of the secularist minority: my argument was about the secularists being a minority and about the limitations which a democratic polity places upon the elected representatives of the people. They can lose their mandate to represent and may not therefore espouse

positions that their supporters reject or about which they feel unenthusiastic. The 1993 assembly elections sent precisely this warning to BJP. The issue, let me reiterate, is not of representativeness but of authority and influence. I do not think we have much evidence that the secularists have either of these in a greater measure than all their opponents.

To draw attention to the limitations of the original ideology of secularism and its Indian version, and of their promoters, does not necessarily imply that one rejects the ideologies totally or the institutions that embody them. Critiques may well result in the strengthening of the institutions concerned if the necessary corrective or reinforcing measures are carefully put in place. Beteille alleges that I believe that "the attempt to adapt [secularism] to the Indian environment is a snare and a delusion" (1994: 560). Actually what I am more sceptical about is the easy confidence of secularists regarding unproblematic adaptation. It was in this context that I made a distinction between 'transfer' and 'translation' of ideas [Madan 1987: 754].

Beteille concludes: "How we view the prospects for the co-existence of religious and secular ways of life will depend in part on how we think of religion"(1994: 561). My position on this may be quoted from the penultimate paragraph of my lecture: "the only way secularism in south Asia, understood as interreligious understanding, may succeed would be for us to take both religion and secularism seriously, and not reject the former as superstition and reduce the latter to a mask for communalism or mere expediency. *Secularism would have to imply that those who profess no religion have a place in society equal to that of others, not higher or lower*" [Madan 1987: 758, emphasis added].

But there is something else also that worries Beteille deeply, and this merits attention. "What causes the most anxiety to secular intellectuals is a conception of religion which demands that every aspect of every individual's life be brought under religious scrutiny and control" [Beteille 1994: 562]. He refers to it as the 'totalising aims' of religion, more demanding in some cases than in others. The crucial question is, he writes, "how much space will be allowed within society by doctrinaire religion for the growth of secular ideas and institutions" (ibid: 564). I agree that this is a key question and, as Beteille acknowledges, applies to all doctrinaire ideologies, religious as well as secular.

Now, it seems that I did perhaps overemphasise the holistic character of traditional relgions, particularly Hinduism, in the 1987 essay. Both Beteille and F G Bailey assert this in their critiques. Quoting from my essay 'Religion in India' (1989), Bailey points out that when I write that "religion is constitutive of society, and the traditional vision of life is holistic", I can be understood as saying that 'society is religion, an ideology' [Bailey 1991: 223]. An almost identical sentence exists in 'Secularism in Its Place': "For Gandhi religion was the source of absolute value and hence constitutive of social life" [Madan 1987: 752].

It seems that in the passage from the concrete case (Gandhi's position) to the general thesis (holistic character of Hinduism) I may have overstated my argument. It would obviously be a throw-back to an untenable Durkheimian sociological extremism to envisage a society in which the secular is non-existent, and I did not mean to propose such a monistic thesis. In 'Religion in India' I wrote: "the point is not that the religious domain is not distinguished from the secular, but rather that the secular is regarded as encompassed by the religious" [Madan 1989: 116].

I would like to emphasise that I do not read the Hindu tradition (so-called) as a denial of the existence of what may be called secular elements, but rather as a statement of a particular kind of relation between the religious and the secular, namely, the hierarchical (encompassing of the contrary). Although I use the language made familiar to us by Louis Dumont, the idea of encompassment itself may be derived from the key concept of purushartha, or the triple goals of human endeavour (dharma, artha, kama) as presented in, say, the Arthashastra or the Manusmriti.

Moreover, my reference to the traditional view of the hierarchical relationship of the sacerdotal and the royal functions is relevant to the extent that the Hindu tradition does not provide us with a dualistic view of the kind which Christianity does, although it admits of a diversity of religious traditions within its broad framework and outside it. The Christian distinction between the sacred and secular domains (two kingdoms, two cities, two swords, etc) is widely held to have contributed to the success of the modern ideology of secularism in the west. As I pointed out in 'Secularism in Its Place', a Hindu or a Sikh, or a Muslim for that matter, would find it more difficult to make sense of the notion of 'privatisation of religion' than, perhaps, a Christian does.

This does not mean that Indians have first to be converted to Christianity before they may be expected to appreciate the virtues of secularism in the sense of its being the ideology of secularisation. It only draws attention to the need for greater efforts on the part of Indian intellectuals to clarify the notion of secularism in a context-sensitive manner, drawing upon India's pluralist traditions. Contrary to what Beteille seems to think, there is sufficient historical and ethnographical evidence that it is the masses of this country, Hindus and Muslims alike, who are comfortable with religious pluralism and indeed practise it. The traditional elite, from whom the great majority of today's intellectuals are descended, disapproved of such pluralism as the superstitious ways of the masses.

Not only have Indian intellectuals to make greater efforts to clarify the notion of secularism, they also have to devise the most effective ways of communication, carrying the people with them, although not in the manner of politicians. Unless they do this, the intellectuals will succeed only in convincing one another. Secularism has to be rescued from the preventing semantic conflation, but this should not mean the imposition of one particular meaning on it. And it has to be made into a national ethos. This will take doing and it will take time. As Beteille puts it, "Secularism had become a shibboleth in Nehru's India, and it is the intellectual's obligation to bring every shibboleth under scrutiny" (1994:559). And this is precisely what I meant to convey through the title as well as the text of my 1987 lecture, 'Secularism in Its Place'. I am not therefore sure that I understand why he found the idea 'strange'.

We help Nature keep her true colours.

As reputed manufacturers of vital chemical products, we've been in the forefront of promoting safety and environment protection.

Our commitment to preserve the environment, improve safety and enhance the health and welfare of our employees and the surrounding community manifests itself in every facet of our operations - right from our choice of technology to process selection and engineering design.

Effluent treatment plants at both our factories render liquid wastes harmless. Sophisticated pollution abatement equipment keep emissions within tolerance limits.

Our R&D wing develops products that are environment friendly, searches for ways to recycle waste and constantly evaluates the effectiveness of our own pollution prevention and control efforts.

We've designed education programmes to inform, train and encourage our employees to actively participate in achieving safety and environmental protection goals; safety inspections and safety audits to assure continuous control; and, onsite and offsite disaster control plans to aid effective response to a wide range of emergencies.

It's all part of our integrated effort to keep our operations safe and harmless.

And to ensure that we help Nature keep her true colours.

Communal Consciousness

To what extent do different cross-sections of society share the communal ideology which provides legitimacy to communal riots? To understand this, we need to explore people's perceptions and opinions on the communal division and related issues. A study of individual identity and communal consciousness and how they get manifested in the political arena based on a survey in Surat city. 1133

Waiting for FDI

Inflow of foreign direct investment into India is likely to increase, but this is contingent on the maintenance of high rates of industrial growth. Even so, inflows anywhere near the Chinese level seem quite out of the question. By contrast, international subcontracting by foreign firms could play a major role in India's manufactured export growth. This is an aspect which has attracted little attention in terms of policy. 1141

Food in Russia

The maintenance of living standards, public health, even life itself are gravely threatened by the scarcity of food in Russia. These circumstances are more the product of the unaffordability of food than its absolute unavailability. 1147

Changing Agenda

Internal positions in the women's movement need to be redefined as the external reality changes or else the movement will become redundant in the face of the newer challenges. This is a major lesson of the riots in Bombay following the destruction of the Babri masjid which dealt a severe blow to the premise that women have a separate existence away from their communal identity. 1123

High Cost

All that the railways' accelerated gauge conversion programme is likely to achieve is to extend the facility of broad gauge travel to people of some favoured areas, but at the cost of irreparable damage to the railways' finances and to real capacity expansion. 1109

No Celebrations

January 1, 1994 was to be celebrated in Mexican history as the opening day of the North American Free Trade Agreement. The rebellion in Chiapas changed all that. 1119

Questioning Liberalism

Intellectual and political debates since the 1980s have focused on the increasing inability of the Indian state to manage the economy and respond democratically to pluralist pressures. Although the points of departure are many, what is suggested is a new political agenda for the state, one that entails a redefinition of its underlying liberal principles. 1112

Broadening Movement

The peasant movement in Bihar which began on the issues of the most depressed sections of the landless peasantry has now caught the imagination of wider masses in Bihari society. 1111

Children's World

The authors of the UNICEF's annual *State of the World's Children* reports do not, for the most part, swallow the nostrums of the World Bank, so eagerly lapped up by our own policy-makers. 1116

LETTERS TO EDITOR

Education and Women's Empowerment

WHILE generally agreeing with the proposition that education of women in developing countries helps them to take an active part in socio-economic development, and is a critical factor in reducing fertility levels and infant mortality, one should not run away with the impression that education alone is good enough to reach these objectives. At the 'Education for All' summit of nine high population countries in Delhi, the question of gender gap in schooling came up at a panel discussion on girls' and women's education, population issues and women's empowerment.

The educational situation of girls and women at the ground level in most of the developing countries diverges considerably from the norms set, and the rhetorical claims made, by the governments of these countries. The majority of 'out of school children' in these countries are girls. Of the 948 million illiterate adults worldwide, over 60 per cent are women—the bulk of whom, needless to add, are concentrated in the developing countries. According to UNESCO estimates, in south Asia, sub-Saharan Africa and the Arab states, two out of every three women do not have basic literacy skills.

As for the causes of this gender disparity, a number of reasons were cited at the above-mentioned panel at the education summit. In many societies girls simply do not have any value other than their reproductive function, as a result of which parents do not 'invest' in the girl child from whom they expect no return on their investment; even if educated, or trained in vocational skills, these girls, their parents feel, will get employment only in marginal enterprises with scant remuneration; since girls will get married off into other families anyway, it is useless to invest scarce resources (of poor parents) in educating girls who will be of no help to their parents. From this list of identifiable causes of the 'gender gap' in education, one may infer that poor parents in developing countries treat their girl children not as objects of parental affection, but by the yardstick of their utilitarian value—or its absence.

But it is not as simple as that. As one of the panelists at the Delhi summit - -Nafis Sadik of the UNFPA—added, perhaps as an afterthought "It should also be noted that even when parents are inclined to send their daughters to schools, often the school situation is unfavourable—for example, the distance is too great, the facilities are inadequate for girls' needs, female teachers are lacking, and the curricula are poorly designed." Is it then the traditional patriarchal values (often internalised by the women themselves) or the lack of infrastructural administrative facilities that obstruct the access of girl children to literacy and schools—or both? It is necessary to go into these twilight areas of literacy and primary education programmes for girls and women.

Further, even when literate, or employed, do women automatically get empowered to take control of their lives? The only panelist who raised this question at the Delhi summit was Shabana Azmi, who gave a fictionalised account of the real life situation of a literate maidservant employed in a Bombay household who maintained her entire family by her earnings, and yet had to face harassment from her husband, an unemployed drunk who regularly beat her up. This is a common fate of female domestics in the metropolitan cities. As long as oppressive social values (e g, sanction and acceptance of male dominance) prevail and opportunities for independent living are denied, employment or literacy alone cannot bring empowerment to women. Instead of facing squarely this basic problem that was posed by Shabana Azmi, the capital's press corps covering a news conference pounced upon her for using living characters for fictitious purposes. Thus, the main topic was turned into a non-issue with the reporters flying off at a tangent, which again proves the point that even in the profession of journalism, education or employment alone does not make newspersons sensitive to controversial social issues, as long as the craze for trivialising serious subjects prevails in newspaper columns.

A Reader

New Delhi

On Secularism

ANDRE BETEILLE's article 'Secularism and Intellectuals' (March 5) is no doubt enlightening. His earnest efforts to give an exposition of the distinctions between secularism and secularisation could be considered positively provoking. However, the article does not indicate the indelible impact of the Renaissance and the French and Russian revolutions leading to secularisation. This was responsible for the tremendous transformations giving rise to the stimulating, salutary and sublime sway of humanism reflected in innovative implications of values of life: Liberty, Equality, Fraternity, Justice, Love and Peace. Nor has the article brought out the remarkable role of Jawaharlal Nehru in giving importance to secularism in the Constitution of India.

After having read the article, one is tempted to pose a question: Has Andre Beteille succeeded in making the distinctions between secularism and secularisation as comprehensive as they ought to be? Very few will give the affirmative answer.

ECONOMIC AND POLITICAL WEEKLY

New South Africa

SOUTH AFRICA's first multiracial elections have passed off smoothly, just as, almost unbelievably, has the entire process of the country's transition to black majority rule after F W de Klerk released Nelson Mandela from prison and lifted the ban on the African National Congress in 1990. The violence witnessed in the run up to the elections died down after the Inkatha Freedom Party's last-minute decision to enter the polls. In the end the most serious complaints appear to be only about the slow counting of votes. Not bad at all for a country whose racially oppressive political arrangements had, till just a few years ago, produced such bitter hatreds and bloodshed internally and universal opprobrium internationally.

The results of the elections again have run true to expectations. With some 15 million of an estimated 22 million votes counted at the time of going to press, the ANC is far ahead of the other parties, though somewhat short of winning the two-thirds majority in the national parliament which would enable it to have its own way in framing the country's permanent constitution. De Klerk's National Party has polled just over one-fifth of the votes and Mangosuthu Buthelezi's IFP about 8 per cent. The Indians and the coloureds have confirmed their known racial biases by voting for the white National Party, thereby contributing to the ANC's loss of two of the nine provinces (Kwazulu-Natal to the IFP and Western Cape to the National Party). In the other seven provinces, of course, the ANC has won most handsomely. The one party to have done more poorly than expected is the black radical Pan-African Congress, which is perhaps to be attributed, apart from that party's lack of resources compared to the well-oiled election campaigns of the ANC and the National Party, to the general conciliatory mood among the blacks in the euphoric atmosphere generated by the rapid progress to black majority rule. Even Buthelezi's decision finally to contest the elections appears to have been forced on him by the dominant sentiment among the rank and file and lower level leaders of his party against being left out of the polls.

Momentous as the smooth conduct of the elections and the ushering in of majority rule unquestionably are, apartheid was not just a political or legal phenomenon. The economic and social inequities systematically engineered by white rule go deep and will, of course, long survive the legal and political demise of apartheid. And the task of eliminating them will not necessarily be rendered more manageable by the essentially peaceful and conciliatory nature of the transition. By taking the initiative in formally dismantling apartheid and thereby emerging as one of the two architects of the new South Africa, F W de Klerk has in fact manoeuvred the whites into a position of considerable moral advantage, erasing as it were their long history of the most brutal racial oppression. This is undoubtedly going to count with Nelson Mandela's government of national unity in the measures it contemplates to curtail white privileges. The ANC has already forsworn any significant land redistribution by agreeing that the principle of 'willing seller, willing buyer' must operate and that the white owners should be entitled to fair compensation. Given Mandela's understandable emphasis on completing the process of national reconciliation, the tasks of racial restitution can also come to be so formulated as to benefit essentially the existing and aspirant black middle classes. A whiff of this can be caught already in the commitment to equalise civil service salaries between whites and blacks here and now, much before any steps have been thought of, for instance, to protect black tenants of white landlords or to improve the condition of black farm labourers. The civil service, of course, provides a quick and easy means of providing jobs to black youth with the requisite educational advantages; the resultant proliferation of the bureaucracy together with the generalising of white salaries and perquisites should produce an early flowering of a black middle class and the illusion of elimination of racial disparities.

Nor is the fund of international goodwill for the new South Africa going to make it easy for Mandela's government to resist the temptation to look for quick results and short-cuts in meeting black aspirations. The Clinton administration has already promised a doubling of US assistance to South Africa. The IMF had in December last year come forward with a $ 849 million loan to help compensate South Africa for export losses and to help pay for food imports made necessary by a severe drought. Both the IMF and the World Bank indicated at their recent meetings in Washington that they will not be found wanting now that South Africa has rejoined the comity of nations as a respectable member. With money thus flowing in from outside, at least in the short run, the government can be led to believe that, lo and behold, it can do a great deal to improve the blacks' lot -for instance, the 2.5 million jobs in a decade, the 3,00,000 housing units every year, the provision of clean drinking water and electricity to remote areas and so on which the ANC has promised in its election manifesto—with a minimum of unwelcome imposts on the whites (and on the swelling ranks of upwardly mobile blacks). By the time the all too severe limits of such economic salvation on the cheap are discovered, it may well be too late. While so much needs to change in South Africa, the few exceptions should perhaps be the low ratio of foreign debt, the positive balance of payments and the proven record of export growth and import substitution with which the country emerged from its period of international ostracism.

AKALI UNITY

Ineffectual

WHAT is significant about the latest events in Akali politics—culminating in the so-called Amritsar declaration—is not that the Akalis have come together under one umbrella. Nor even that their first and politically most potent demand is for a separate Sikh state. For, neither the attempt at unity nor the demand is news to those familiar with Akali history. What is significant is, first, that the Akalis have attempted to unify under the pressure of a religio-political authority, the jathedar of the Akal Takht. And what imbues the event with significance in this regard is that not so very far back they had *disintegrated* due to the pressure of a similar authority—the authority bestowed upon different persons or a combination of them at different points of time by a religio-political militant movement. Together, this attempted unity and the earlier disintegration signify that Akalis are not now, nor were they in the immediate past, an independent political force in their own right: they were, and are, just a potentially available political front for a religio-political force out to create a theocratic state. Which makes the religio-political force and not the Akalis the pivot around which the Sikh politics in the immediate future would move.

The second point of significance lies in this very centrality of the religious authority in Sikh politics that these events once again bring to the fore. The roots of this centrality go back to the very origins of the Sikh community which emerged and took shape as a religio-cultural entity as well as a political force as the result of a single linear process. The power of the religious authority to shape Sikh politics in our day and the absence of a strong secular force which could challenge this power from a purely political front show that the process which has cemented the religious and the political in the Sikh community continues to operate. It is this absence of a large enough crack between the religious and the political in the latter-day Sikh tradition that continues to make it different from, particularly, the Judaeo-Christian traditions which had similar origins but have, over the centuries, succumbed to the secularising pressures of modernity.

Since we live in an era in which modernity is either on the wane or has become confusedly mixed with what has come to be known as post-modernity, and since this latter is characterised by a re-efflorescence of the religious element in all traditions, we are likely to witness, at least for a time, a continuation of the influence of the religious authority in Sikh politics on a purely objective plane. Subjectively, however, no historical force has been beyond the moderating pressures of a counter force. In the context of Punjab, if such a counter-force has not yet fully emerged from within Sikh politics, or if it has failed so far to strengthen itself sufficiently to adequately exert against the powerful religio-political authority—the refusal of Parkash Singh Badal so far to join the unified Akali Dal and the statements of Akali Dal (Longowal) general secretary, Kanwaljit Singh, against the nature of the current unity moves show that the elements of such a counter-force do exist, howsoever tentatively and weakly, within the Sikh and Akali communities—then these pressures must come from outside Sikh politics. These pressures, needless to say, must be democratic and secularising in their essential make-up, for such precisely are the elements missing in current Sikh politics. Finally, to the extent that these moderating pressures would have to come from other political entities/formations, to that extent the Akalis, despite their sizeable numerical presence and following, would substantively remain marginal in the overall politics of Punjab. This holds a lesson for the Akalis.

VSNL FIASCO

Lessons to Learn

THE events leading up to the deferment of the much publicised $ 1 billion Euro issue by Videsh Sanchar Nigam (VSNL) should provide yet another warning of the untenability of hasty and wrongly-sequenced reform. Though there are many proximate causes of the fiasco linked to developments in the domestic and foreign financial markets, the root cause lies in the government's unsustainable economic policies—an obvious consequence of pandering to the appetites of foreign investors and fund managers.

Initially VSNL was to raise $ 500 million (Rs 1,500 crore) through the Euro issue, which amount was itself considered high, but the department of telecommunications became more ambitious towards the early part of 1994 and the size of the issue was upgraded to $ 1 billion. At the instance of the lead managers, disinvestment of VSNL shares in the domestic market in the latest phase was avoided so as not to conflict with the GDR issue abroad. Many other PSUs were also allowed to raise money through Euro issues in the form of GDRs, though Euro bond issues have been discouraged as they would raise India's external indebtedness. This was in the wake of the euphoria created by the success of some 25 companies mobilising about $ 2.5 billion through issues of GDRs or Euro-convertible bonds in 1993-94 and foreign institutional investors' sizeable investment in the Indian capital market. The interest of foreign fund managers and FIIs in the Indian capital market was stimulated by the ultra-liberal facilities offered by the government. The tax on dividend or interest accrued to foreigners on their holdings of GDRs, Euro-convertible bonds and Indian shares and securities has been fixed at a flat 10 per cent; similarly, they have to pay only 10 per cent tax on long-term capital gains on such investments. Initially, there was a two year lock-in period for conversion of GDRs into shares but this was removed in November 1992. While foreign fund managers thus succeeded in creating a sense of euphoria, domestic companies were enthused to mobilise funds from abroad because, as part of the capital market reform, all conditions regarding the end-use of funds were done away with. Also, interest rates on these borrowings are much lower than those in the domestic market. Despite the country's credit rating being low, the easy availability of liquidity in the international financial markets made foreign investors look for Indian company floatations.

The government adopted the same approach when the central cabinet accorded approval for the $ 1 billion VSNL issue on March 9. The foreign resources were being sought as a substitute for budgetary resources. The telecommunications sector was a coveted one among the multinationals and hence also among the Euro fund managers. At the same time, it was clear that the raising of some Rs 3,000 crore through GDRs by VSNL had no basis in the organisation's investment programmes. The book value of VSNL's gross fixed assets at the end of March 1993 was only about Rs 500 crore. The Eighth Plan had proposed for VSNL an outlay of Rs 800 crore for the five-year period, that is, Rs 160 crore per year. In the Annual Plan for 1993-94, the Planning Commission showed VSNL's annual expenditure at Rs 397 crore in 1992-93 and Rs 286 crore in 1993-94. On the other hand, the telecom sector's total outlay was pushed up from Rs 5,073 crore in 1992-93 to Rs 6,324 crore for 1993-94 and this had to be funded almost entirely by the resources mobilised by the telecom sector itself. In order to justify the Rs 3,000 crore GDR issue, VSNL has now come out with three major new projects outside the Eighth Plan.

On the face of it, there are substantive domestic and foreign market causes for the VSNL debacle. First, market conditions abroad have undergone significant changes. When the issue was approved on March 9 there were already signs of a slump, particularly in the so-called emerging stock markets, as a consequence of the hardening of US treasury rates and a surfeit of international equity issues since January this year. Investors are interest sensitive and prefer US assets when the US economy is doing well and yield rates on government bonds there are reasonably attractive. Second, practically every one of the 21 GDR and nine Euro bond issues of Indian companies (which together raised over $ 2.67 billion) during the past 15 months has been quoted at a discount; the discounts have ranged from 5 to 40 per cent. Thirdly, domestic stock markets in India experienced a downswing. Finally, a number of specific factors also emerged as constraints on the VSNL issue. Apart from the absence of any definitive programme for productive use of the funds, the original indicative price mandated by the cabinet at Rs 1,400 to Rs 1,600 ($ 44.60 to $ 51.0) per share turned out to be too high

and the foreign investors began putting pressure for the price to be reduced to the range of Rs 1,100 to Rs 1,200 per share. The foreign managers also raised doubts about VSNL's profitability which, according to market perception, depended on the volatile cost-sharing arrangement laid down by the department of telecommunications. Market reports indicated that the firm Morgan Stanley, which was initially favoured for the lead manager status and replaced at the last minute by the joint global co-ordinators, Salomon Brothers and Kleinwort Benson, apparently carried on a campaign to denigrate the issue. A secret document circulating in the European markets, hinting at a number of problems with the VSNL issue, has been attributed to the above source. It has also been suggested that the company's shares are overvalued in the domestic share markets, that the VSNL's profits would be much lower now because as a corporation it would have to pay corporate tax while earlier it was paying only annual dividend to the general revenues. Further, it has been revealed, obviously to the dismay of foreign investors, that there were serious differences between the minister of state for telecommunications, Sukh Ram, and the Telecom Commission chairman, N Vittal and, further, that no drastic reform in the direction of privatisation would take place until teledensity had reached 3 per cent, probably by the turn of the century. All these factors have obviously played a role in forcing the government to postpone the VSNL issue.

The lessons to be learnt from the episode are wide-ranging. The flow of funds into third world markets is largely governed by the liquidity position in the international financial markets. As a result, foreign investors and fund managers prove to be fair-weather friends. When they are in possession of liquidity, they put tremendous pressure on the governments of developing countries. In the Indian case, they had initially refused to respond because they thought that the price-earning ratios on the Indian share markets were prohibitively high. Then US interest rates fell and the second half of 1993 and early 1994 saw significant fund movements into the Indian and other 'emerging' markets where share prices shot up. The further rise in P/E ratios and the country's low credit rating did not evidently deter the FIIs. Foreign merchant bankers and their Indian associates have been arguing that even 0 1 per cent of the trillions of dollars of pension and other funds held abroad would fetch India more than $ 10 billion a year of portfolio investment. But what the VSNL experience has also shown is that the attempt to grab funds just because they are available can boomerang with the smallest of adverse developments. Now for quite some time the 50-odd Euro issues planned for this year will face an uncongenial environment in the foreign financial markets as the focus will be on the poor industrial and corporate performance here and there will also be misgivings regarding India's macro-economic stability.

KASHMIR

Certificate Denied

THE government of India has quite evidently got carried away by its own propaganda over its self-proclaimed success at the UN Human Rights Commission conference in Geneva some weeks back in having convinced all and sundry of the righteousness of its case on Kashmir. How else is one to account for its expectation that the group of 11 envoys, eight of them representing countries which are members of the Organisation of Islamic States, would hand it a good conduct certificate after a strictly stage-managed visit to the valley?

The least the ministry of external affairs could have done was to be discreet. If the visit of the group of envoys to Kashmir was part of the bargain that had to be accepted at Geneva to stave off a formal resolution charging India with human rights violations in Kashmir, as it undoubtedly was, it should have tried to get it over with as little fuss as possible. Instead it chose to claim, and the claim was as usual lapped up and prominently reported by the country's press, that the envoys' group had returned from Kashmir fully convinced of Pakistan's support for terrorism there. What is more, it was added for good measure, the envoys were thoroughly satisfied with the arrangements laid out for their visit which had left them free to go where they pleased and meet whomsoever they wished to. To anyone with the slightest notion of the situation in Kashmir, it was evident that these claims had more than a whiff of brazenness about them. And now they have boomeranged on the government.

One of the members of the group of envoys, Iran's ambassador in India, has been constrained to issue a formal statement charging the Indian government with "misleading the diplomatic group" and "not fulfilling the terms" under which the envoys had agreed to be taken to Kashmir. Now, if the government's propaganda were to be believed, persuading Iran of the justice of India's position in Kashmir had been the major success of Indian diplomacy at the UNHRC conference, causing that country to pressurise Pakistan to withdraw its resolution against India. In his statement, issued by the Iranian News Agency and broadcast over Iranian radio, the Iranian ambassador to India has pulled no punches: the pre-arranged itinerary of the envoys' visit "never materialised"; they had not been allowed to meet the leaders of the Hurriyat Conference, nor representatives of the people of Srinagar nor the ordinary people anywhere else; they were not allowed to go to Sopore and Bijbehara, scenes of two of the worst massacres by the security forces; they were also not taken to the Hazratbal shrine, as had been promised, and so were unable to verify the Indian government's claim that the army siege of the shrine had been lifted. In every case, the government of India had pleaded security considerations, giving the lie to its claim of the situation in Jammu and Kashmir being near-normal now. The Iranian ambassador's statement thus concludes, "the Srinagar visit has been incomplete and the aim of clarifying the situation in Kashmir is yet to be achieved. In Delhi we were told that the situation in Kashmir had improved and we had hoped to visit large areas of the state. The situation is totally upside down."

Confronted with the Iranian ambassador's statement, the government has now sought to take the position that the envoys' visit had never been meant to be a fact-finding mission What else was its purpose then? And had not the government itself earlier claimed— when it thought it could get away with that claim—that the envoys had, after their visit, endorsed the government's position in regard to the situation in Kashmir? The fact appears to be that the government has been led into an embarrassing diplomatic *faux pas* and all because the authorities have lost sight of the vast gap between their own propaganda and the reality in Kashmir.

Another reminder of the gap between the two has been provided by the findings of the National Human Rights Commission on the firing by the Border Security Force on the protest march against the army siege of the Hazrathal shrine on October 22 last year in Bijhehara town in which at least 37 people had been killed and some 73 injured. When the massacre occurred the authorities had claimed that the BSF had been forced to open fire after militants in the crowd had started shooting and this was what had been widely publicised by the official media and the newspapers. Now, on the basis of the evidence before it, the commission has found that "there were no armed militants in the crowd, the members of which were shouting political slogans and slogans against the siege of Hazratbal shrine by the defence forces". The firing by the BSF had been without any provocation and also without any warning. Confronted with the commission's report, the home ministry has predictably taken the stand that as "the terrorists in Kashmir are mostly operating from urban/built up areas and are mixed up with civilians, the BSF, while tackling the militants, cannot avoid involvement with the civilian population". The plea is, of course, totally irrelevant since what had happened in Bijbehara was that the BSF had opened fire, in the commission's words, at "an unarmed crowd of citizens because the latter were shouting slogans and complaining against the conduct of the armed forces".

The point, of course, is that the conduct of the security forces in Bijbehara, as in countless other instances, was not an aberration; it was essential to the government's strategy of 'pacification' of the Kashmiri people. But, when the government simultaneously seeks certificates of good behaviour from the international community, some odd situations are bound to arise.

IMF-WORLD BANK

US's Negative Role

THE International Monetary Fund (IMF) and World Bank have just concluded another of their joint semi-annual meetings. In recent years the annual and semi-annual meetings of the Bretton Woods institutions have been increasingly dominated by three factors: the interests of the industrialised countries; the stellar performance of the east Asian economies and the attempt to impose the alleged lessons of their experience on the rest of the developing world in Asia, Africa and Latin America; and the intransigence of the US in regard to practically every aspect of the functioning of the world financial and trading systems and in particular the roles of the multilateral institutions

At the latest semi-annual meeting there were some sharp exchanges on the IMF managing director's strong case—now being reiterated for more than a decade—for the allocation of additional special drawing rights (SDRs) which has been persistently opposed by the US Recommending in the Interim Committee that additional SDR 36 billion be created, Michel Camdessus argued that in the present situation where either countries get fresh SDR allocations or reduce imports, "it is an absurdity to constrain resources of countries interested in buying goods to fuel their growth", particularly at a time when economic activity is still sluggish in the industrialised countries. The IMF staff has been pointing out how there has occurred a shortage of liquidity in the world economy in relation to the growth of trade in goods and services and other activities and further that the available liquidity was very inequitably distributed with many poor countries facing acute shortages Reiterating the time-worn American stand that an additional SDR allocation would create excess liquidity and produce inflation, US treasury secretary Lloyd Bentsen stonewalled: "I am not persuaded that there is a general shortage of reserves of liquidity in the world economy. Therefore, I see no basis for a large allocation of SDRs". With this it was easy for the Interim Committee to shelve the issue for further consideration by the IMF's executive board and recommend instead that the developing countries should pursue strong structural adjustment programmes, ignoring the fact that countries in Africa, west Asia, south Asia, and Latin America continued to face an uncongenial world economic environment.

Despite the failure to get a fresh SDR allocation, the IMF managing director has proposed the institution of a cofinancing trust accounts (CTAs) system ostensibly to support both the developing countries and the 'economies in transition' of east Europe, but primarily to accommodate the pressing and large-scale balance of payments needs of the latter Even with regard to helping the 'economies in transition', America has been dragging its feet. The big bully attitude of the US is now being felt in all multilateral agencies, particularly when it concerns allocation of funds. It is known how, with its veto power, the US has been reluctant to release funds for the quota increases in the IMF and World Bank and, more significantly, for IDA replenishment. Even in regard to the latest subsidy account of the IMF's enhanced structural adjustment facility (ESAF) to which 24 developing countries have provided 21 per cent of the total contributions and which the IMF managing director hailed as representing the broadest possible participation, the US's contribution has been only SDR 73 million, while that of Britain is SDR 82 million and Japan and France SDR 250 million each; India has contributed SDR 11.3 million.

Apart from getting the Interim Committee to agree to commend a detailed study of the systemic risks associated with highly expanded trade in exotic financial products called derivatives, the US has proposed and got approved by the Development Committee the setting up of a task force to review the role that multilateral institutions, including the World Bank, play in the economic development of the third world The hidden agenda to constrict the activities of the IMF and World Bank became clear when Lloyd Bentsen said, "just as these institutions promote reform in member countries, they must also be alert to reforming their own administration and operation".

It is the same tactic to divert attention from more purposeful support for industrial and infrastructural development and social sector activities that was notable in the deliberations of the Development Committee. At the instance of the committee, World Bank president Lewis Preston has decided to sponsor a conference in early 1995 to study the impact of the Uruguay round on the developing economies. Secondly, with the aim of focusing increasingly on population and social sector issues and thrusting an integrated population policy on developing countries, the Development Committee agreed that the three objectives of development that deserved attention were improvement of primary school enrolment, improving access to family planning and related health services and reduction in maternal and child mortality in developing countries.

PALESTINE

PLO on Trial

THE latest agreement between Israel and the PLO, signed after more than seven months of protracted negotiations on May 4, is a mixed bag. While it concretises Palestinian self-rule in Gaza Strip and the West Bank town of Jericho, it leaves unresolved many of the issues that had delayed this agreement in the first place. The agreement nevertheless marks a step forward in the process that began with the signing of a pact on September 13 last year promising Palestinian self-rule in these areas. At the same time, it shows that Israel is not willing to give up its security interests in these areas even if it means compromising the PLO in the eyes of the interested Arab states, other Palestinian organisations and the Palestinian people.

Some of the crucial issues which had stalled the progress in negotiations were: (i) size of the area around Jericho to fall under Palestinian self-rule; (2) control of the border crossings from the self-ruled territories to Egypt and Jordan; (3) future of the Jewish settlers in these territories; and (4) release of the Palestinian prisoners held by Israel. While final decisions on the first three issues have for the moment been deferred and negotiations on them will continue, Israel will vacate the Gaza Strip and 64 sq km around Jericho within three weeks from signing of the agreement after which PLO will take charge of these areas. The first step towards this will be the deployment of 9,000 Palestinian police personnel. Meanwhile, Israel will release those of the 8,400 Palestinian prisoners, nearly 5,000, who are not involved in the murder of Israeli citizens and who are not members of the radical Islamic group Hamas that opposes the peace process.

The focus of attention will now shift from the Israel-PLO negotiations to the self-ruled territories of Gaza and Jericho. The clinching of this deal has opened up another role for the PLO: in addition to continuing the struggle for an independent Palestinian state, it will now have to govern the territories that have been handed over to the Palestinians, at least till the elections to the new governing bodies are held later this year. Apart from putting a new burden on PLO's already thinly-spread administrative and manpower resources, it will make it vulnerable to a new line of attack from organisations like Hamas which will try to project PLO rule as an oppressive and, possibly, a comprador regime protecting Israeli interests in the Palestinian territories.

A lot will depend, in this context, on how the PLO governs these territories and what kind of governing institutions it puts in place or allows to emerge. Given the fanatic opposition of the radical groups, it may like to deal with them with a firm hand. However, the fact that the radicals enjoy a great deal of popularity, particularly among the youth, and that the PLO will have to face elections in a few months may force it to adopt a softer and more diplomatic approach. Those who like to see the emergence, eventually, of a democratic Palestinian state, would pitch their support, no doubt, to the latter course. They will have to temper their optimism with caution, for Yasser Arafat is known to be a man with authoritarian leanings, a fact which is resented within the PLO. This indicates another question for the observers of Palestine to ponder. In the new environment that has now been created in Palestine, how long will Arafat remain the dominant leader in-charge of Palestinian as well as PLO affairs?

Gee El Woollens

GEE EL WOOLLENS is entering the capital market on May 11 with a public issue of 40.18 lakh equity shares of Rs 10 each at par. The issue is being made to part finance its Rs 4.82 crore project for expansion of spinning capacity from 600 tpa to 1,500 tpa as also for setting up a tufted and loom carpet unit by way of forward integration. The project is being set up at Bikaner in Rajasthan and is expected to go on stream in September this year. The company's equity which stands at Rs 33 lakh at present will go up to Rs 4.4 crore after the issue. The lead managers to the issue are SBI Caps and POL Leasing. Gee EL has reported a turnover of Rs 1.75 crore and a net profit of Rs 10.8 lakh for the nine-month period ended September 1993. It has projected a turnover of Rs 4.1 crore and net profit of Rs 30 lakh for the 18-month period ending September 1994.

Kesari Chemicals

Kesari Chemicals (KCL), a company engaged in the manufacture of H-acid, a dye intermediate, is undertaking a forward integration project into black-B (a reactive dye) and is also modernising its H-acid capacity. The former project is expected to entail an investment of Rs 3.05 crore and the latter of Rs 1.5 crore. To partly meet the cost of the two projects, the company has entered the capital market on May 5 with a public issue of 34.03 lakh equity shares of Rs 10 each at par. The issue closes on May 10 and is lead managed by Sterling Securities. The company's equity after the issue will go up to Rs 4 crore from Rs 60 lakh at present. While the H-acid modernisation project is expected to be completed by next month, the forward integration project is expected to go on stream by October. The company has projected a turnover of Rs 7.3 crore and a net profit of Rs 87 lakh for 1994-95.

Jai Mata Industries

Promoted by Jai Mata Rolled Glass, Jai Mata Industries is setting up a project to manufacture coarse cotton yarn of 4s to 14s count. The project cost has been estimated at Rs 8.5 crore and it is being funded entirely by equity. To this end, the company is entering the capital market on May 9 with a public issue of 81.34 lakh equity shares of Rs 10 each at par. The promoters will have a 30 per cent share in the post-issue equity capital of Rs 8.2 crore. The issue is being lead managed by SBI Caps and PNB Caps. The project is being set up at Rohtak and the company claims that it will be able to sell its entire output of 3,000 tonnes in Panipat, Sonepat and Ludhiana. According to projections, the company is expected to post a net profit of Rs 1.4 crore on sales of Rs 8.8 crore in 1994-95.

Lakshana Cotton

Part of the Sri Ramakrishna group of Coimbatore, Lakshana Cotton Spinning Mills has been manufacturing cotton yarn since 1982. It now proposes to enhance its capacity from 19,512 spindles to 22,392 spindles involving a capital outlay of Rs 2.9 crore. To part finance the project, the company entered the capital market on May 5 with a public issue of 22.20 lakh equity shares of Rs 10 each at par. Lead managed by Ceat Financial and 20th Century Finance, the issue closes on May 10. Having posted losses for two years, the company is optimistic of a net profit of Rs 75.8 lakh for 1994-95 on net sales of Rs 10.3 crore. The project is scheduled to commence commercial production in April 1995 though the company is confident of advancing this to October this year.

Vivid Chemicals

Originally set up to manufacture beta naphthol, a raw material for tobias acid which is a dye intermediate, Vivid Chemicals started manufacturing tobias acid itself. It is now augmenting its capacity of tobias acid from 720 tpa to 960 tpa at a cost of Rs 2.1 crore. To part finance the project, the company is coming out with a public issue of 16.30 lakh equity shares of Rs 10 each at par of which one lakh shares have been reserved for NRIs. However, it has been found that the expansion project is expected to entail an expenditure of only Rs 23 lakh and the remaining part of the funds will be used to repay Rs 1.36 crore institutional dues. The issue opens on May 10 and is being lead managed by PNB Caps. The company's equity will go up to Rs 4 crore after the issue from Rs 2.4 crore at present

Sheetal Filaments

Sheetal Filaments, promoted by Omprakash Verma and family, who have interests in two companies, Sheetal Organisers and Developers and Sheetal Fibres, is entering the capital market on May 10 with a public issue. The company is offering 21.57 lakh equity shares of Rs 10 each at par of which five lakh shares have been reserved for NRIs and another four lakh shares for mutual funds. The issue is being made to part finance its Rs 5 crore draw-twisting unit with a capacity of 470 tonnes per annum and sizing yarn unit having a capacity of 500 tonnes per annum. Both the units have already commenced commercial production and the company has projected sales of Rs 10.4 crore with net profit of Rs 1.04 crore for 1994-95. The company's equity after the issue will go up to Rs 3.4 crore up from the present Rs 1.2 crore. The management also has plans of merging Sheetal Organisers and Developers, which is in the construction and texturising business, with Sheetal Filaments. The lead manager to the issue is Bank of Baroda.

Moneycare Finanz

Moneycare Finanz, India's first specialist portfolio manager, is entering the capital market with a public issue of 28,00,000 equity shares of Rs 10 each at par aggregating Rs 2.80 lakh. The company is tapping funds from the capital market to finance the setting up of a branch infrastructure at various locations both within and outside the country to sell the company's products and services and the acquisition of information technology equipment The issue opens on May 27 and the lead manager is Kotak Mahindra Finance. At present the company deals through four stock exchanges—Bangalore, Bombay, Madras and Hyderabad— and has a network of brokers to support its secondary market operations. However, the company is currently investing only in equity markets. For the first 10 months of 1993-94, the company has posted a loss of Rs 15.4 lakh on total income of Rs 17.4 lakh. However, according to projections made by the State Bank of Mysore, Moneycare will show a net profit of Rs 89.74 lakh on gross income of Rs 755.8 lakh in 1995.

Interlink Petroleum

Interlink Petroleum (IPL) has entered the capital market on May 4 with a public issue of 68 lakh equity shares of Rs 10 each at par to part finance its Rs 10 crore project for providing seismic surveys The issue is being lead managed by S M Finance. Promoted by John Koshy and associates, Interlink Petroleum was set up to provide services related to the oil sector, including seismic surveys and work over operations, in technical collaboration with Zapadneftegeofizika (ZNGF) of Russia. The latter also has a financial stake in IPL to the extent of 28 per cent of its equity. IPL has signed three MoUs One, with ZNGF and Grynberg Production Corporation of the USA for the development of Boqueron High oil field at Paraguay in South America, two, with Hindustan Oil Exploration Company for oil field services work; and three, with ZNGF for carrying out seismic work for their ongoing contracts in Iran, Iraq, North Korea and Vietnam. After the public issue, the company's equity will go up to Rs 7 crore from the current Rs 20 lakh.

CURRENT STATISTICS

EPW Research Foundation

The latest data show a quantum jump in imports in the fourth quarter of 1993 94 a one third rise over January-March 1993 resulting in a total annual import bill of $ 23 2 billion With exports of $ 22 2 billion (20 4 per cent increase) the trade deficit stood at $ 1 billion in 1993 94 Among the major items of exports food and live animals (28 3 per cent) gems and jewellery (38 4 per cent) and chemicals (24 5 per cent) registered large increases, while capital goods exports showed a moderate rise of 12 3 per cent In imports the highest increase (14 2 per cent) occurred in capital goods while chemicals and iron and steel items registered declines With the prepayment of $ 1 13 billion due to the IMF foreign exchange assets (excluding gold) have declined to $ 14 58 billion

Notes (1) Superscript numeral denotes month to which figure relates, e g, superscript 7 stands for July. (ii) Unless otherwise specified, figures in brackets are percentage variations over the comparable previous period.

CEAT

New Joint Ventures

THE flagship company of the RPG group, Ceat has been able to retain its number one position in the car tyres segment even during a period when the tyre industry was saddled with a large idle capacity caused by recession in the automobile industry which led to low offtake of tyres by vehicle manufacturers. But though net sales increased by 5.7 per cent in 1992-93, a comparatively smaller increase in expenses notwithstanding, the company's profitability suffered a setback with operating profit and profit after tax declining by 11 per cent and 17 per cent, respectively. On the export front, the company sold tyres for light commercial vehicles, farm implements and earth-mover loaders and tubeless tyres specially developed for overseas customers, 50 per cent of which were sold in the US and European markets. On the whole exports doubled. Ceat also developed radial tyres for the Maruti Zen.

Research and development efforts have enabled the company to develop metric light commercial radial tyres for export to the US, besides widening the product range, reducing dependence on imports by endusers in view of superior processing and mechanical properties of indigenously developed glass fibres. These apart, Ceat has chalked out a number of projects that will further consolidate its position in the market.

First, in a joint venture with Goodyear Tire and Rubber Company of the US, the company plans to manufacture in Maharashtra radial tyres for passenger cars, light vehicles and trucks, in addition to very large off-the-road (OTR) tyres of conventional construction. Goodyear and Ceat will have 50 per cent stake each in the company and the plant will have an installed capacity of 5,00,000 tyres per annum. Second, Ceat is setting up a joint venture with Associated Motorways in Sri Lanka to manufacture automotive tyres involving an investment of 140 million Sri Lankan rupees. Third, the company is also setting up the country's biggest fibre glass company through an in-house transfer of assets. Ceat's fibre glass division will be transferred to the group's newly acquired company, FGP. Having a capacity of 10,000 tpa, the fibre glass division is the largest in the country so far. The company has plans to set up yet another joint venture in Vietnam

However, if the half yearly results for 1993-94 are any indication, Ceat's full year results are not expected to be that good. This is because its Nashik plant was shut in September 1993 following an indefinite strike by its employees. The plant manufactures all types of tyres for trucks, LCVs, two-wheelers and passenger cars with a daily production of 6,000 tyres. Although Ceat posted a 20 per cent higher turnover of Rs 424.6 crore, net profit fell by 30.2 per cent when compared with that of the corresponding period of 1991-92. The company is selling off its photocopier division as part of its restructuring strategy and its electronics division has been referred to the BIFR

ZUARI AGRO CHEMICALS

Good Response to Agri-Products

Promoted by Birla Gwalior (P) and Armour and Company of the US in 1967 to manufacture fertilisers and allied products, Zuari Agro Chemicals has come a long way. Besides its mainstay, fertilisers, the company has diversified into sugar as well as production and procurement of hybrid seeds. However, its performance over the years has been affected by the government's indecisiveness on fertiliser pricing.

During 1992-93, owing to lower consumption of phosphatic fertilisers, higher imports of DAP and steep rise in prices following the decontrol of fertilisers which affected the working of the indigenous plants, Zuari Agro's turnover, net of excise, declined by 1.6 per cent. However, a check on expenditure enabled the company to improve its profitability. It launched a new grade product (20:20:0:15), a sulphur-enriched NP grade which is widely applicable for a wide variety of crops. Its efforts to market agri-products also received good response with pesticides turnover going up by 42 per cent to Rs 11.7 crore. It has also commenced marketing of Biophos, an environment-friendly product, besides procurement of hybrid/high-yielding seeds of jowar, bajra, sunflower and tomato. An R and D farm and seed testing facility has been established at Hyderabad to promote marketing of seeds.

The company has also diversified into cement and has promoted a new company, Banas Cement, with a capacity of one million tonnes per annum (tpa). Further, apart from an argon recovery and purification plant at its existing plant in Goa, a sugar factory is being set up in Bidar district of Karnataka with a cane crushing capacity of 2,500 tpa. The capacity of the sugar unit is expected to be enhanced to 5,000 tonnes per annum.

During the first half of 1993-94, Zuari Agro posted a turnover of Rs 242.2 crore, up 19.5 per cent from the corresponding period of the previous year. Net profit increased by almost 10 per cent to Rs 6.7 crore.

HOECHST

Widening Products Range

Part of the worldwide German pharmaceutical group, Hoechst AG, Hoechst India is the largest producer of pharmaceuticals in the group outside Germany. Recently, the parent company increased its stake in its subsidiary from 40 per cent to 51 per cent.

Hoechst India, which changed its accounting year from calendar year to financial year in 1988, has seen its profitability dipping since then. Sales too have increased by only 4.5 per cent per annum over the past four years compounded annually. Except for 1989-90 when its profit after tax doubled, in the following years the growth rates in both profit before tax and profit after tax have been steadily declining. In 1992-93, while net sales increased by 8 per cent, profit after tax declined by 35.4 per cent. The company has put the onus of the fall in overall profits during the year on the low volume of exports, high interest costs and decline in other income.

During the year, while the pharmaceutical division's domestic sales recorded a growth of 19 per cent due to the introduction of research products, agro sales grew by 14 per cent. Domestic sales of animal health products also increased by 22 per cent but only a modest growth of 5 per cent was achieved in sales of feed supplements for poultry due to the crisis in the poultry industry.

During the year, the company received industrial licences to manufacture Baralgan Ketone and formulations, glybenclamide and formulations, Roxatidine, Novalgin, Lasiride and Batrafen and their formulations. Letters of intent have also been received for the manufacture of Ramipril and formulations, Tabalon tablets and Tarivil tablets (at Ankleshwar) and Cosavil Syrup and Streptase formulations at Mulund.

In technical collaboration with the Swiss Serum and Vaccine Institute, Hoechst India is introducing an oral typhoid vaccine, containing a special strain of the typhoid bacterium, Salmonella Typhi in live form. It is also introducing Ramipril, a drug meant for the high-risk patient group suffering from myocardial infarction.

During the first six months of the year ended September 1993, Hoechst India recorded a turnover of Rs 177.9 crore and a net profit of Rs 3.1 crore against a turnover of Rs 144.2 crore and profit after tax of Rs 2.6 crore posted in the corresponding half of 1991-92.

SURAT ELECTRICITY BOARD

Capacity Expansion

Surat Electricity Board ended fiscal 1992-93 with a mammoth 10-fold increase in

profit after tax on a 20 per cent increase in net sales The company has attributed the increase in sales to the increase in fuel adjustment charges and revision of tariff Had it not been for the heavy monsoon and riots, the company's distribution of energy would have been even better The increase in profits did not bring about a commensurate increase in the share of remuneration to employees in gross value added and value of production in fact, the former declined by as much as 7 7 percentage points

To better its performance during 1993-94, Surat Electricity Board has installed new transformers of higher capacity in 44 sub-stations in replacement of old ones and 12 additional transformers were installed in the existing substations, thus taking the total number of substations to 545 Further, a new receiving station near GIDC Katargram having an installed capacity of 15 MVA was commissioned, thus taking the total installed capacity of the company for import of power from GEB to 210 MVA and contract demand to 197 5 MVA The company also proposes to commission an additional 15 MVA transformer One more receiving station with an installed capacity of 15 MVA is proposed to be established in the Udhna-Magdalla area to meet the increasing demand in that area With this, the company's installed capacity is expected to go up by 30 MVA to 240 MVA

During the first six months of 1993 94, Surat Electricity has posted a net profit of Rs 1 6 crore, almost the same as in the corresponding period last year, on a turnover of Rs 102 7 crore as against Rs 84 7 crore in the second half of 1991-92

HYDERABAD INDUSTRIES

Higher Profitability

Hyderabad Industries a C K Birla group company, is a leading manufacturer of asbestos and cement products which are sold under the brand name Charminar' 1992-93 was a mixed year for the company, While sales increased by only 4 6 per cent because of recessionary trends and reduced industrial activity, profitability improved by 26 per cent through cost reduction and optimum utilisation of inputs In terms of volume, while production of asbestos cement products fell to 1 57 703 tonnes from 1 83,076 tonnes in 1991-92, that of mill boards, moulded thermal insulation articles, jointing thermal insulation products (refractories), crushers, screens and pumps were satisfactory The company's heavy engineering division is now planning to add new models of hydraulic excavators to the existing range with technical know how from Mannesmann Demag Baumaschinen of Germany

During the first six months ended September 1993 the company has posted a turnover of Rs 94 crore and a profit after tax of 2 8 crore up 10 7 per cent and 180 per cent, respectively

RAILWAYS

Home Truths about Gauge Conversion

M N Prasad

Diversion of scarce resources to gauge conversion of existing metre gauge and narrow gauge lines, ignoring the pressing needs of real capacity augmentation, is not unlike trying to solve the housing problem by giving priority to replacing existing smaller houses with bigger ones, rather than adding as many new houses as possible.

IN the railway budget for 1994-95, presented in parliament on February 24, the main thrust is on pushing ahead with the so-called 'Project Unigauge', the ambitious scheme of large-scale gauge conversion, launched by the railway minister two years ago. Neither the resource constraints nor the deteriorating financial and operating performance of Indian railways (IR), which is largely attributable to its lopsided investment priorities, has deterred the ministry from the relentless pursuit of the same for the third year running. On the other hand, there has been a conscious effort to make believe that all is well with the railways and that the overriding priority given to gauge conversion (GC) is about the best thing that has happened to IR since independence.

Introducing the budget, the minister stated on the floor of the house that "the project 'Unigauge' has been widely acclaimed and has received all-round support and encouragement". In saying so, he has, for obvious reasons, suppressed the fact that no less a body than parliament's own Standing Committee for Railways had sharply criticised the ministry, as recently as in December 1993, for the undue priority given to GC, without proper appraisal of its benefits and at the cost of neglecting other vital areas of development, both infrastructure and rolling stock.

IR's corporate mission, which is supposed to be the guiding principle for all its planning, is "to be a modern railway system, with sufficient capacity to meet the country's transport needs, both for passenger and freight traffic, based on an optimum intermodal mix, and to provide this transportation at the least cost to the society, while maintaining the financial viability of the system". But, of late, there has been a glaring lack of concern in the ministry for the vital aspects of 'sufficiency of capacity' and 'economy in cost to the society'. Even 'financial viability' is being maintained only through steep yearly increases in passenger fares and freight rates, or by cutting down investments in vital areas. The same trend is discernible in the latest budget, except for a sudden stepping down of hikes in fares and freight to levels even lower than the yearly escalation of input costs.

This has apparently been done for popularity sake, but at the cost of the following: (i) A drastic reduction in procurement of rolling stock, especially passenger coaches, instead of stepping up the same to achieve a healthy growth of traffic. (For 1994-95, the targets proposed are only 1,600 coaches, inclusive of EMUs, 18,000 wagons and 135 diesel locos, as against the average of 2,503 coaches, 23,065 wagons and 165 diesel locos achieved during the last two years.), (ii) The proportionate outlays on new lines, doublings and other traffic facilities, all of which are more cost-effective than GC in the matter of capacity augmentation, have been reduced still further, (iii) The yearly contribution to Depreciation Reserve Fund (DRF), which bears the cost of replacements and renewals of all assets, has been cut by Rs 300 crore, for the second successive year, reversing the healthy convention established early in the Seventh Plan. In the light of these realities, it is beyond comprehension what the minister meant by assuring parliament that "whatever resources the Indian railways mobilise will be used in an optimal manner and every rupee spent would be on need-based plan activity". Obviously, this assurance cannot be taken at face value, unless it is to be presumed that the sole mission of IR is to speed up GC.

As for the pros and cons of the 'Unigauge' programme, its main strength lies in the tremendous popular appeal it commands in that, once an MG section is converted to BG, people would be able to travel faster, with the added possibility of reaching several major destinations like Bombay, Calcutta and Delhi without changing trains *en route*. There is also a notion that BG will help usher in economic development of backward areas through freer and faster movement of goods, especially critical materials like coal, steel and cement needed for industrialisation, without the hassles of break-of-gauge transhipment. But, in reality, the materialisation of industrial growth will depend on several other factors as well, which can only be appraised through proper techno-economic studies. There are many parts of the country which continue to be backward, although served by BG lines from the very beginning. This is also the case with sections like Bangalore-Guntakal and Barabanki-Samastipur-Katihar where GC had been carried out over 10 years ago. On the other hand, there are some regions like south Tamil Nadu and parts of Gujarat which developed industrially even though served by MG lines. As a matter of fact, certain foreign countries, including the whole of south-east Asia and even some developed countries like Japan and part of Australia, are served exclusively by MG railway systems (except for the new high-speed lines of Japan which are meant for fast inter-city passenger traffic).

Another advantage of GC, which its protagonists often claim, is that it will open up alternative BG routes that will help relieve the existing saturated routes, thereby reducing the need for doubling of such routes. But, in reality, only very few of the MG and NG lines sanctioned for GC under the 'Unigauge' programme are so located as to serve as viable alternatives to the saturated routes. And even these few will not afford any appreciable relief to the saturated routes because they would only be single lines where movements are comparatively slow and there would only be very limited spare capacity for moving additional freight traffic, after meeting the needs of traffic on the erstwhile MG route. This is amply borne out by the experience on most of the converted routes, like the two mentioned in the last paragraph. If at all any of these is really to be developed into alternative routes for major traffic flows, they would first have to be doubled, to generate additional capacity and to ensure free flow of freight traffic. Cutting down on doublings and proliferation of BG single lines through GC, as is presently being done, will not be of much help for capacity augmentation.

On the negative side, the main drawbacks of the present 'Unigauge' programme are the following: (i) As a means of generating additional capacity, GC is far less cost-effective than new lines and doubling, since the net increase in capacity is only the difference between the capacity of the existing MG and the proposed BG, whereas the cost of GC is nearly 75 per cent of that of construction of a new line. (ii) In order to

maximise the progress of GC with the available resources, a 20 per cent reduction in the initial cost of GC is presently being achieved by deferring certain essential works like raising of platforms and provision of foot-overbridges to connect them and even strengthening or rebuilding of some bridges to suit BG standards. IR will find it extremely difficult to clear the accumulated backlog of such works at a later date, when faced with public outcry against lack of facilities or with bridges developing signs of distress. (iii) Proliferation of GC and drastic cutting down of doubling is bound to affect the pace of railway electrification in the near future, because the minimum traffic density needed to justify the heavy initial cost of RE cannot be carried by any of the BG single lines created through GC. Normally, RE can only be justified economically on routes laid with double or multiple lines. (iv) GC works carried out for development of backward regions are not likely to generate any significant additional traffic in the near future. Hence, the capital sunk on such projects will remain a dead investment for many years, entailing additional burden on IR in terms of dividend or interest liabilities. This, in turn, would have to be passed on to the users through steeper hikes in fares and freight rates. (v) As part of the logistics of doing GC projects on a crash programme, instead of the conventional method of spreading it over several years, the MG sections which are to be converted to BG are being closed down for about three months, or even longer, before being reopened as BG. This entails considerable loss of revenue to the railways and serious inconvenience to the users. (vi) The near-10-fold acceleration of the pace of GC, without a matching back-up in procurement of BG rolling stock, has resulted in large-scale diversion of available BG coaches, wagons and locomotives to operate services on the converted routes. This has greatly aggravated the shortage of BG rolling stock, while MG rolling stock is being rendered surplus and offered for export. (vii) With the deteriorating finances of IR, achieving a yearly progress of 1,600 km of GC, or even a total of 6,000 km during the plan period, has meant slowing-down of real capacity augmentation, including the much-needed additions to rolling stock. This, in turn, would impair the growth of traffic from year to year, affecting IR's finances very adversely. (viii) Even assuming that the targeted progress of 12,000 km of GC is achieved by the end of the Ninth Plan (which is highly improbable, considering IR's deteriorating financial health) there will still be about 15,000 km of MG and NG routes left in the country. In other words, the dream of 'Unigauge' would still remain unfulfilled, unless it is decided to close down these routes, which is easier said than done. (ix) The way GC is presently being executed, the MG system, which was a well-knit countrywide network until 1992, is fast getting reduced to a shambles. This will mean a steep decline in the quality of services available to the hapless people on the residual MG system. This would further be compounded by problems of safe maintenance of rolling stock and relief measures in case of accidents, on those MG sections which get isolated as a result of GC.

Unfortunately, the champions of the 'Unigauge' programme seem to have been conveniently shutting their eyes to these hard realities and painting a rosy picture, extolling the virtues of an all-BG railway system, the materialisation of which is itself an unlikely prospect. All that may actually be achieved would be to extend the facility of BG travel to the people of some favoured areas enjoying political patronage. In the bargain, the finances of IR would have been subjected to irreparable damage.

The manner in which the high-flown idea of 'Unigauge' was initially sold to the prime minister, in order to secure his support to the grandiose scheme and thus pre-empt any opposition from other quarters, especially the Planning Commission and the finance ministry, reminds one of the well known fable of 'the Emperor's New Clothes', a classic example of make-believe, where everyone, from the monarch down to the man in the street, was taken for a ride, at least for a while.

'Unigauge' enthusiasts have also tried to add a touch of patriotic fervour by misleading the people to believe that the bane of multiple gauges was the wanton creation of the British rulers. But the real fact is that, according to the original policy for railway construction in India, as formulated by the then governor-general, Lord Dalhousie, only Broad Gauge was to be adopted in India and "the evils of having two gauges, as had erroneously been permitted in the UK, should be avoided". This policy was strictly adhered to for the first 20 years of railway construction in this country. It was only in 1870 that the then GG, Lord Mayo, recommended the adoption of Metre Gauge as a cheaper alternative for those branch and feeder lines which could not justify the heavy investment on BG. This dispensation was mainly intended to facilitate provision of rail communication in sparsely populated and backward regions which could not otherwise have had any railway at all. It also enabled several princely states to have railway systems of their own, at a cost they could afford. But it was only after independence that a major effort was made to unify the entire MG system into one vast network, with interchange and transhipment facilities at junctions with BG. And now, under the guise of 'project Unigauge' the same MG system is being broken up, with the promise of its total elimination which may never materialise.

Another interesting, but little known fact of IR's history is that, in the year 1971, the then railway minister had launched a similar programme of GC, covering 4,000 km, with the almost identical objective of "doing away with the uneconomic drag of multiple gauges". But it was soon realised that GC could only be done at a modest pace if other more pressing needs of capacity augmentation and rehabilitation were to be met concurrently. Based on detailed studies carried out, it was finally decided that GC should only be done selectively, where the traffic density was heavy or transhipment at break-of-gauge points caused severe bottlenecks. It was also decided to upgrade other important MG routes to enable faster passenger trains (90 to 100 km/h) and heavier freight wagons to be run. Consequently, while presenting the budget for 1981-82, the then railway minister had informed the house that "despite the obvious advantages of an uniform gauge, the massive input of resources is a luxury which a developing country like ours, with perennial constraint on resources, can ill afford at this stage". Between 1981 and now, the resource position has only worsened, accompanied by widening of the gap between traffic demand and carrying capacity. What then has brought about the sudden reversal of approach to GC from 1992? It is basically a change in outlook and philosophy. Earlier, it was a case of 'discretion is the better part of valour'; now it seems to be 'valour without discretion'.

Since parliament is a political institution, one should not be surprised if the investment proposals contained in the railway budget for 1994-95 are finally voted as it is, regardless of whatever may be the adverse implications thereof or whatever the Standing Committee for Railways may have had to say in the matter. But wholesale gauge conversion, as is presently being attempted, with the professed objective of removing inter-regional disparities and ushering in economic development of backward areas hitherto served by MG and NG lines, is analogous to upgrading all roads in the country to national or state highway standard, in the hope that they will form alternatives to the existing national and state highways which are saturated and will help bring about uniform economic development of even the remotest parts. Diversion of scarce resources to GC of existing MG and NG lines, ignoring the pressing needs of real capacity augmentation, is also not unlike trying to solve the housing problem by giving priority to replacing existing smaller houses with bigger ones, rather than adding as many new houses as possible.

Changing Peasant Struggle

Amaresh Misra

One of the main themes of the mass peasant rally in Patna on March 18 organised by the CPI(ML) was the revival of the JP movement on a new basis under a Left leadership.

THE flaming fields of Bihar are in news once again. Two recent widely reported incidents have brought home the fact that the peasant movement which began on the issues of the most depressed sections of the landless has now caught the imagination of the wider masses in the Bihari society.

The first incident of the police firing on CPI(ML) activists in Sahar, Bhojpur which left seven dead occurred following a stand-off between CPI(ML) activists and the police when the former were gheraoing the local Congress MLA from the region and demanding that the said figure announce publicly her assets both before and after becoming the MLA. The CPI(ML) has launched this drive all over Bihar as part of a mass programme of democratic awakening which includes making the legislatures accountable to the people extending to the right to recall. The drive in itself is both a novelty and contentious in the charged atmosphere of Bihar where capturing political office is an accepted means for money accumulation and legislatures are notorious for their aggrandising methods.

The stand-off left seven dead and several injured but during the struggle with the police, the majority of the village and large sections from the surrounding areas came out spontaneously on the side of the protesters. Not only in Bihar but in UP also the incident was noted for its element of mass militancy and upsurge—the Delhi-UP based Hindi daily the *Rashtriya Sahara*, a right wing mouth piece wrote an editorial terming the incident as being "without precedence". It also went on to warn that mass involvement of this kind are a prelude to a gathering revolutionary storm and cited the one lakh plus turn out at the March 18 rally in this regard. It went on to warn in its own language that the governments of the day could ignore this event only at their peril as the peasant movement in Bihar had now taken on a mass political dimension.

Occurring in succession, the two events have once again focused attention on the tremendous potential of the Bihar peasant struggle which had dimmed following the coming to power of Laloo Yadav and the new social equation it fostered. The IPF-CPI(ML) had suffered a series of reversals in the 1991 parliamentary polls and thereafter Laloo Yadav had succeeded in driving a wedge in its legislative wing by weaning away a few MLAs. At the same time the media had started publishing reports about the rise of other ML groups like MCC in Bihar and the marginalisation of the CPI(ML). Yet, even when the party was facing rough weather during the height of the Mandal polarisation the predominantly poor peasant base of the party had remained intact. What is more, the dynamics of the CPI(ML) was not based on the permutations and combinations of parliamentary politics which guided the perceived split in its legislative ranks. The very contradiction on which the movement was based—that between entrenched feudal survivals and the wide masses of the peasantry—was a real one and kept it alive even when Laloo was riding high.

At the same time, the contradiction had crossed the earlier stage of isolated actions and was demanding a larger resolution based on political assertion and mass movement. In this, the old practices of formations like the MCC were clearly out of date: they could go on like this for many years but in a phase when an organised political force of the same social base was emerging their role could either be for or against it. The MCC chose to strike out on its own but was caught in the objective struggle between the political establishment and the CPI(ML) ultimately serving the interests of the Bihar chief minister in his bid to counter the CPI(ML) threat. At present, the MCC for all its militancy stands discredited in the eyes of democratic opinion for training its guns on the CPI(ML) instead of the landlords—a turnabout which perhaps lay in its very semi-anarchist political line of eschewing mass-political activity in favour of an absolute insistence on armed actions.

These threats however were countered by the CPI(ML). Cadres were restrained from counter attacking the MCC and its challenge was sought to be met politically. The party intensified land struggles and took even its armed dimensions to new mass-political heights. The blend of parliamentary and extra-parliamentary means with primary emphasis on the latter paid rich dividends and the growing public disillusionment with the present Bihar regime gave the CPI (ML) a new context to finally emerge against its principal adversary.

Here three broad and fresh tendencies were instrumental to a large degree. Firstly, as in a number of recent anti-Laloo caste rallies of mainly the non-yadav backward castes other depressed sections, a growing alienation of these forces from the Laloo regime is increasingly becoming visible. Secondly, many adherents of the erstwhile JP movement on the legacy of which the Bihar chief minister actually rode to power are also voicing their disenchantment and this feeling is being echoed by general democratic sections as well. Thirdly in the highly politicised environment of Bihar there is a growing demand for a state power which is more responsive to public needs. At all these three levels, the failure of Laloo Yadav is apparent—he has not succeeded in offering anything substantial to the poor by way of land reforms, etc, while failing far short of appeasing the middle classes. On the economic front, despite all its mineral wealth and resources, Bihar remains plagued by chronic lack of industrial development and all other evils of economic backwardness. There was hope among a section of the intelligentsia that Laloo's accession would see the rise of the more entrepreneurial backward classes and speedup development. But this turned out to be an illusion—the backward power groups that rose under the JD proved to be as capricious as their upper castes counterparts following the tradition of frittering away surpluses and resources in unproductive channels. Moreover, culturally these forces, instead of undermining the brahminical order and the larger *status quo* have proved to be the vehicle of a new brahminism of sorts seen eloquently in the Bihar chief minister's open advocacy of the Ashwamedha Yagya in Patna.

What is more, within the dominant caste configuration the most depressed remain unrepresented while their aspirations are aroused. This is perhaps the logical outcome of caste-based mobilisation which ultimately splits up along its very line of unity. But the very rise of new power groups and the conditions generated in the interregnum are also being reflected in the enhanced class democratic consciousness of the people in general and the deprived sections in particular. Such developments are furthering demands and creating an objective basis for a wider social change which are outside the limits of the existing framework of the Bihar government.

It is against such a backdrop that the land struggle unleashed by the CPI(ML) is acquiring the dimension of a wider struggle for social change, modernisation and democratisation in Bihar. Its new political dimension is evident from the fact of the March 18 rally virtually 'appropriated' the old JP plank of social revolution of the 70s in the changed context of the 90s—one of its major theme was the revival of the JP up-

surge on a new basis under the leadership of the left. The rally declared Laloo Yadav as the 'illegitimate' product of the 70s movement and projected the CPI(ML) struggle and the social forces unleashed by it as its true legatee. According to this logic the JP impulse failed because it could not link itself to the most oppressed sections of the populace which constitute the radical base for a genuine programme of social change.

Quite unsurprisingly, this argument is finding ready takers in Bihar and among democratic forces. At least in Bihar the anti-feudal struggle in the villages is becoming the converging point of a larger democratic urge also—the movement thus possesses tremendous potential in view of further socio-political change not only in Bihar but the country as a whole.

Alarmed by this trend, the Bihar government has unleashed a reign of terror and the Bhojpur killings perhaps indicated an evolving approach. Such methods however are not taking into account the changed situation which is forcing other left parties who normally shun joint activities to participate in common programmes. The Bihar bandh of the CPI(ML) called to protest against the Bhojpur killings was supported by CPI and CPI(M) and on this basis the CPI(ML) has given a strategic political call for an alternative left government in the state. This is being projected as a fresh concept of left unity based on the heat and strength generated by grass roots struggles finding their way to mainstream politics different in many respects from the primarily government-centred West Bengal model of left unity.

The lessons of this Bihar experiment cannot be exaggerated especially at a juncture when the Dunkel issue is creating the context for a widespread movement against the growing imperialist penetration. It is becoming clear that opposition to the Dunkel Draft cannot proceed along old lines—for a long-term sustenance it sooner or later will have to link itself with an impulse for a wider socio-economic change. In many respects therefore, despite appearing in terms of representing a general national issue, opposition to the Dunkel Draft is also very much a class directed issue and is related more to an alternative path of development than to opposing certain strictures of imperialism. As such the role of the left will be crucial in determining its outcome and here the flame ignited in Bihar will probably play a decisive role.

State and New Liberal Agenda in India

Gurpreet Mahajan
Sudha Pai
Niraja G Jayal

Two types of questions emerged from the discussions in a recent seminar on the neoliberal agenda in India: (1) What kind of political institutions are required by an economically liberalising multi-religious and multi-cultural society like India? (2) Can the political theory of neoliberalism retain an emphasis on redistributive and welfare goals?

INTELLECTUAL and political debates since the 1980s have focused on the increasing inability of the state to manage the economy and to respond democratically to pluralist pressures. These discussions of state capacity, in the face of growing economic and political crises, have brought into question the validity of the Nehruvian model of development that has underlain state policy and action for much of India's post-independence history. Every major element of this model has been jeopardised or challenged: a liberal democratic pluralist polity, industrialisation-linked development, a mixed economy, and an interventionist secular state have been critiqued from a variety of perspectives, including the Gandhian socialist and the environmentalist. The most effectuated critique, of course, has come from within the establishment itself, viz, from the official proponents of greater marketisation. This project takes as its point of departure the poor performance of the public sector, the large and recurring budgetary deficits, the declining growth rate and the breakdown of centralised planning.

The shift in governmental thinking and the strategies of development and planning have come at a time when we are also witnessing the resurgence of communal politics and the spread of separatist and ethnic movements. These challenges to the nation-state and the notion of secularism have, at the theoretical and analytical plane, been accompanied by attempts to legitimise communitarian ethics and politics. While some social scientists argue that principles of liberalism and secularism are alien to, and conflict with, the essence of Indian culture and society, others maintain that the predicament of the Indian nation-state is a reflection of the malaise of modernity.

Although the points of departure are many, almost all of them suggest a new political agenda for the Indian state: one that entails a redefinition of its underlying liberal principles, or, at least, a critical dialogue with the inherited tradition of liberalism.

The Centre for Political Studies, Jawaharlal Nehru University, convened a seminar titled 'Explaining Indian Politics: The State and the New Liberal Agenda' on January 19-21, 1994 to debate these issues. The seminar addressed itself to the changes that have occurred in the economic ideological spheres, and their implications for the Indian polity. It sought to consider whether these constituted a decisive shift to the right. Since similar and almost concurrent ideological and economic changes in the western world—e g, Thatcherism and Reaganism—have been characterised as a shift to the right, the seminar examined whether the Indian experience warranted the same characterisation; also, whether changes in India could be seen as part of a universal trend towards neoliberalism. In particular, it reflected upon the implications of the new agenda for the welfare state, and the possible ways in which questions of equity and justice could be addressed in our society.

Cultural and Ideological Right

The increasing communalisation of politics and society has been a major concern for analysts of Indian politics. The seminar shared this concern by reflecting upon the nature and practice of communalism and identity politics, and the viability of secularism in the Indian context. Discussion of these questions was prefaced by analyses of the concept of 'the right'. Initiating this discussion, Gurpreet Mahajan argued that while rejecting an essentialist definition of a concept, we need, nevertheless, to identify attributes which have, over time, been associated with particular usages of the concept. Since concepts discursively limit the reality they can absorb, we need to specify elements in terms of which certain kinds of realities can be appropriately covered and represented by a concept. Informed with this methodological understanding, she argued that the concept of the right has two regnant attributes: (a) support for free enterprise; and (b) emphasis upon tradition and cultural bonds in the life of the individual and the nation. Over time, conceptions of the right have evoked either or both of these attributes. In the 20th century, an emphasis upon the former has been the distinguishing attribute of what might be called the 'economic' right, while centrality to the latter has characterised the 'cultural' or the 'ideological' right. The economic right does not, it must be noted, advocate social conservatism; in fact, by granting primacy to the individual, it frequently questions the basis and value of collectivist and communitarian ways of life. The cultural right has, however, been associated with social conservatism, even at times favouring xenophobic nationalism, elitism and racism. In the Indian context, the 'cultural right' has been a vehicle for protecting and

promoting community (defined usually in religious terms) interests.

Focusing on the RSS, through an analysis of its paper *Organiser*, Mahajan argued that the RSS could be characterised as nationalist-communalist: its rabid patriotism being manifest in its opposition to foreign capital (MNCs in particular), strengthening of the defence forces, protection of territorial integrity and designation of movements against the centre as secessionist; and communalism in its politics of 'friend and foe'.

Kiran Saxena maintained that the "amorphous and multifaceted nature of right politics" defies the use of a "single yardstick"; moreover, 'conservatism' and 'progressivism' associated with the right and the left, respectively, are "situational". Tracing the development of right-wing politics and organisations from the colonial period to the present, Saxena argued that the structure of right-wing politics could not be isolated from "capitalist development" and the "unfinished renaissance" in India. The latter was confined to the middle classes; besides, it was initiated by a foreign agency which was responsible for the economic misery and cultural subjugation of the large mass of the people. Consequently, resistance to the British on the cultural plane took the form of "an uncritical admiration of the past". In the politics of the extremists, a "strong anti-imperialist fervour was coupled with a strong dose of Hinduism". This helped, once again, to mobilise the upper caste Hindus. At the time of independence, the "mainstream right-wing within Congress" rejected the idea of a theocratic Hindu state, and it did not share the "communal approach of Hindu nationalism". The "extreme right-wing Hindu communal politics" evident today is, therefore, different from liberal right-wing politics. If anything, it is rooted in "the anti-liberal, anti-democratic Hindu communalism as crystallised in the Hindu Mahasabha."

Reflecting on the recent popularity of the BJP, Saxena said that the party is helped by the many fronts of the RSS. Zoya Hasan also saw the influence and success of the BJP as a consequence of the communalisation of politics. Referring specifically to recent political developments in UP, she maintained that the "politics of identity" has taken over the space previously occupied by the "politics of social transformation". This shift has been assisted by fissures within the Congress Party and the appeal of the VHP's programme for the traditional Hindu-upper caste, which constitutes almost 40 per cent of the electorate in the state. The failure of the Congress to concede the Muslim demand for the restoration of status quo in Ayodhya has also contributed to the decline of the party.

Yogendra Yadav endorsed the view that the 'poor' performance of the BJP in the 1993 assembly elections was not a sufficient indicator of the erosion of its political influence. The results should not be interpreted as a vote "against communalism". Despite its inability to win a majority of the seats in individual states, the BJP had won more seats in this election than any other party; and it remained a party with the largest percentage share of votes in the states of north India. Moreover, it had actually managed to expand its support in new areas, such as north Rajasthan and west UP, and among social groups like Sikhs in Rajasthan and Delhi, and jats in UP. Hence, its defeat was "more symbolic and notional, than substantive".

According to Yadav, the BJP faces two challenges today: first, to decisively re-occupy the discursive space of Hindu nationalism—its ideology, images and symbols—which is no longer a suspect ideological programme; and second, to express the aspirations of the dalits, backwards, tribals and the poor in general. A "stapling" of social concerns to its core ideology is, Yadav argued, not enough: a "thick ideological fusion" of these is necessary if the BJP's bid for power is to come to fruition.

Ashis Nandy emphasised the distinction between the communalisation of politics and communal violence. Referring only to the latter, he pointed out that incidents of communal riots had increased almost six-fold between 1954 and 1985, while the annual casualties in these riots had increased ten-fold. However, these incidents were concentrated only in six states while 10 others were virtually free of riots. Comparing the total number of homicides in a north American metropolitan city with people killed in communal violence in India, he argued, that there was an "over-concern" with the latter. Against those who claim that "communalism as an ideology is the ultimate source of communal riots", he noted that "as modernisation and secularisation of India has progressed, communal violence too has increased". Most religious and ethnic riots are concentrated in cities and industrial areas where modern values are more conspicuous and dominant, and money, politics and organised interests play an important part in them.

Explaining why riots are concentrated in cities which have a larger proportion of Muslims, he suggested that these happen to be areas where Muslims have either been able to take advantage of competitive democratic politics to assert their rights, or, else, where there is a sizeable number of unemployed Muslim youth. In the former, it is easy to use the stereotype of socio-economically aggressive ethnic groups, while in the latter, fear against urban crime tends to feed into communal politics.

More generally, Nandy maintained that the self-interest of competitive political parties and the concept of the nation-state have contributed heavily to the growth of communal hostilities in the country. Nivedita Menon expressed agreement with Nandy's insight that both communalism and secularism share the same discursive space of post-enlightenment rationality and the ideology of the nation-state. The project of the nation-state coincided, in her view, with the secularist attempt to privilege the identity of the citizen while simultaneously disavowing all other loci of identities. Radical democratic politics must reflect on the fact that the homogeneous subject constructed by the discourse of secularism fits well with the needs of "a highly centralised", "capital intensive" and "high technology" based capitalist development. The left and democratic forces in India are, she argued, caught in a dilemma where, as advocates of secularism, they want to banish religion from the public arena, while for social reform, they seek active intervention by the state.

Rajeev Bhargava, on the other hand, argued that there *is* place for secularism in India, and that secularism can be defended even in a society of believers. Distinguishing between ethical and political secularism, he maintained that the former might appear unsuitable for India, but the latter, interpreted as "exclusion or principled distance", would not be seen as threatening by the believer. Besides, it is not a culturally specific doctrine. There may, however, be one serious objection to the doctrine of political secularism: namely, that it depends upon a low degree of community which is not sufficient for a "healthy" society. Hence, it would at best be a "stop-gap" arrangement.

While participants generally endorsed the view that the politics of identity continued to prevail in northern India and that the influence of BJP was not declining in this region, some maintained that recent developments suggest that, as a party, the BJP may not eventually be significantly different from the Congress, and also that it may not pose a serious threat to the principles enshrined in the Indian Constitution. In this context, S K Chaube emphasised the need to differentiate between various forms of identity and their evolution over time. Bishnu Mohapatra raised the question of the relationship between the cultural and economic right in India. In contemporary India, he considered it important to examine the way in which the cultural right is trying to structure society, and asked whether we should allow questions of identity and religion to be appropriated by the right. Expressing reservations about the characterisation of the cultural right in India as "nationalist", Bhambhri wondered whether there was a 'left' version of nationalism. Madhavan Palat reminded us that we might learn from the experience of other countries. The difficulties with the proposed characterisation of the right arise because we in India see nationalism as a progressive policy of integration. However, in Soviet Russia, nationalism was the source of decisiveness and disintegration. Alok Rai queried the distinction between communalism as an ideology and communal violence. The fact that there are, as Nandy had argued, more homicides

in the US than people killed in communal violence in India, does not mitigate the potential for violence that is contained in communalism. Besides, were murders and killings the only actions that need to be condemned on moral and ethical grounds? The question that surfaced in discussion was—'On what grounds can a communal ideology and politics be defened?' Neither the problems inherent in the idea of secularism nor the analytical distinction between communal ideology and violence was, it was felt, sufficient for defending the former.

Political Economy of Neoliberalism

The discussion on the political economy of neoliberalism was initiated by Y K Alagh, in his keynote address. Alagh argued that the new liberal agenda has a definite ideological content inasmuch as it seeks to protect private property and provide for the rule of law. Its major objectives have been to internationalise the economy, generate employment, abolish controls, reduce tariffs, and sustain a rapid pace of economic growth. However, he advised a cautious approach which does not treat neoliberalism as a universal agenda for restructuring. Globalisation, he argued, should be an open agenda that can provide space for community initiative and action at the local level. Given the established relationship of communities to natural resources such as land and water, for instance, the environmental aspects of economic development have to be handled at the community level. Thus, community efforts and decentralised markets have, in his view, a distinctive role to play even in the new liberal order.

In the Indian context, the new liberal agenda, particularly policies of economic liberalisation, has been seen as a significant departure from, if not a decisive break with, the social-democratic approach of the Nehruvian model. Sarah Joseph contested this argument, pointing to the continuity of goals in the two programmes: both uphold the modernising goals for Indian society and rely on capitalist and liberal-democratic institutions to achieve them. Both also reserve a crucial role for the state in the process, though the mode of state regulation may be somewhat different. While the contemporary debate has focused on deregulation and privatisation *per se*, the more worrisome aspect, for Sarah Joseph, is the subtle changes being brought about in notions of democracy, justice and welfare, where citizens' empowerment in the new context means "preparing them for competing effectively in the market". Marketisation, she fears, would remove some decisions from the political arena and thus reduce the scope for political pressures on the state. This would occur despite the emphasis on 'good governance' placed by the World Bank.

G Haragopal stated that the present agenda is neither new nor liberal. Using an historical approach, he argued that the term 'liberal' carries different connotations in postcolonial societies. In the west, liberalism, associated with the industrial revolution, opened up debates on "individual initiatives" in the political and social spheres. In India, colonialism led to the establishment of coercive state instruments of extraction and not development, and the freedom movement and independence failed to transform this. Up to the mid-1960s, the Nehruvian model of consensus held together a multi-class alliance without introducing structural changes. It is the inability of the state to fulfil the promise of redistributive social justice, and the rising discontent of the masses who had hoped for radical change, which underlies the increasing levels of state repression. The new liberal agenda is the outcome of economic collapse and the resulting policies of structural adjustment. This has led to loss of political sovereignty and increased economic dependency. In such a situation, Haragopal argued, democracy cannot exist, and this has serious implications for human rights in India. The new "brutal path of development" hence combines a liberal market economy with an authoritarian fascist polity.

In another discussion of the impact of the new liberal agenda on democratic rights, Aswini K Ray posited a "direct positive correlationship over time" between the nature of the Indian state, its linkage with the global order, and the relative salience of coercion in domestic conflict resolution. The less the leverage of the state within the global order, the greater, he argued, has been the degree of repression in domestic politics, and vice versa. State sovereignty can thus be judged by its resistance to external influences in domestic policy-making, on the one hand, and its ability to assert independent policies in international relations, on the other. Within this perspective, we can assess the possible implications of the neoliberal agenda on the democratic right of citizens in a postcolonial democracy like India. If the conditionalities of globalisation constrain the domestic and foreign policy options of the Indian state, then it follows, as a logical corollary of this framework, that the salience of coercion in domestic policies could be greater, negatively affecting democratic rights.

Kuldeep Mathur addressed the inability of the new liberal agenda to provide a solution to the economic and political crisis. Neoliberal theory, he argued, fails to capture the complexities of state failures and market failures in third world societies and presumes that its prescription of debureaucratisation has universal application. In the Indian context, he argued, it is necessary to go beyond the polar opposites of the market and centralised bureaucracy to a third alternative, namely, voluntary organisations. Reducing state interventionism provides political and institutional space to work out these alternatives. Since neoliberalism is known more for efficiency than for a distributional thrust, the state must continue to play an active role. The government must create conditions to support and protect these organisations through creating legal and contractual mechanisms to help sustain them. In the Indian situation, marked by weak markets and ineffective bureaucracy, Mathur felt, these would be viable alternatives.

The question of reform of the vast public sector apparatus has been a key issue in the debate on changeover to a market-oriented economy. Arun Kumar's paper argued that the public sector has played a substantial role in the industrialisation of the economy and in fact provided the base for the further growth of the private sector. Weakening of the public sector by elimination of budgetary support, divestiture of its equity and giving it a marginal role in the economy, jeopardises not only the goals of development but also of equity. It would also, over time, undermine India's relatively autonomous industrial base which has been a major achievement since independence. Recent policy changes in the public sector are reflective, in his view, of the "sub-optimality" of the ruling classes as well as the assertiveness of international capital. He questioned whether privatisation would resolve the current economic problems and felt that the public sector should be reformed to make it more efficient.

Focusing upon the economic aspects of the shift, Sudha Pai argued that the main impact of liberalisation of industrial policy has been a shift from developmentalism based on the strategy of growth with justice towards an elite-oriented model of growth. The role of the state is being redefined and the new instruments of intervention, in the industrial sphere, would be located primarily in the fiscal and monetary sectors. The role of the state in the market economy of the future would be two-fold: streamlining and improving the efficiency, competitiveness and "financial health" of the system, and reorienting subsidies and support-structures towards the really "needy", preventing "leakages" to those who do not need them. Thus the new liberal state attempts to combine market efficiency with state welfarism.

Against the background of the implications of GATT and the Dunkel Draft for Indian agriculture, Muzaffar Assadi's paper examined new agrarian movements in the specific context of Karnataka. Earlier, farmers' movements were directed against specific economic issues such as remunerative prices, subsidies, etc, given by the state. Today, due to external pressures, larger questions such as the entry of foreign companies and protection of farmers' rights by the state have emerged.

The possible threats to national sovereignty posed by globalisation and integra-

tion into the world capitalist system were the underlying concern of two papers. C P Bhambhri made a strong plea for defending the nation-state and Rakesh Gupta felt that the issue of security would remain paramount even in the changing international scenario. Bhambhri pointed out that while the state played a key role during the period of modernisation in Europe, today it is under assault in postindustrial capitalist societies. The end of the cold war provided an opportunity for issues embedded in civil society such as ethnicity, ecology, human rights, gender, etc, to emerge. At the global level, third world countries face political, economic and ideological pressures to conform to these new ideas. He cautioned against the western postmodernist emphasis on the autonomy of civil society, as the Indian state is the product of third world anticolonial nationalist movements, and any analysis of Indian problems must focus upon internal contradictions.

Analysing the current phase of globalisation, Rakesh Gupta argued that, despite the neoliberal agenda and the trend towards economic integration, security issues will dominate the relations of states in the coming decade. He disagreed with the interpretation of the present "unipolar moment" as representing the "enlarged possibilities...of a world of peace based on capitalism", reinforcing mutuality and stability rather than national security and conflict. In his view, contemporary trends—including the instability of the multi-polar world, nuclearisation in Europe and Asia, military doctrines emerging in Russia, China and Japan, SAARC's incapacity and ASEAN's fledgling attempts to discuss security, and the ethnic blood bath in Bosnia, etc—will continue to be preponderant in the international system, despite the greater attention given to women's rights, ecology and self-determination. When the contradictions of the unipolar moment have been exposed, "new great powers will replay the games that the nations have continued to play in history".

On the more general question of the nature and characterisation of the new liberal agenda, most of the participants maintained that in India, policies of liberalisation would not necessarily imply the 'rolling back' of the state. What is more likely is that the role of the state would change: it would now intervene in different sectors and attempt to regulate rather than actively participate in the economy. Its envisaged task would be to create opportunities in which markets and investments would grow. Since this would necessarily imply alterations in the priorities and commitments of the state, it was felt that concerns of redistributive justice and equity may now take a back seat. E Sridharan pointed out that analysis of policies in terms of class interests must be supplemented by discussions of the changes in the class character of the Indian society. Support for the new economic policies comes from a new and vastly expanded middle class. Consequently, concepts such as 'elites' need to be defined more vigorously. The economic policies of the Indian state, either under the Nehruvian model or under the present regime, did not provide for an egalitarian society or distributive justice.

Rights, Community and Justice

The papers in the last session addressed the question of social justice and attempted to provide a theoretical framework within which questions of justice, equity and rights could be resolved. Since these issues have, in the Indian context, been particularised in terms of claims from diverse groups and communities, the papers examined the strategies adopted by the state in specific cases and reflected upon the pressures that have been placed upon liberal theory from advocates of group rights.

Speaking of the tribal population of India, Manoranjan Mohanty argued that the needs and claims of this group of people justified support for the 'right to earth'. He argued that the earlier strategies adopted by the Indian state emphasised cultural assimilation. The new tribal movements had, however, been able to place the issues of economic exploitation and deprivation on the agenda. We need today to recognise that the state and commercial interests have been equal partners in the denudation of forests, the displacement of tribal people from their habitat, and consequent loss of tribal control over the natural resources by which they live. Given the economic and cultural disentitlement of the tribal people, he maintained that we need to extend the right of self-determination to incorporate also a right to earth as a fundamental human right. This would imply that the "people of an area have a right to protect the resources that 'mother earth' possesses in that area for their use and have a right to negotiate the terms under which they can share those resources with others".

The need for rooting claims to welfare and justice in the language of rights and entitlements was emphasised by Niraja Gopal Jayal and Dipankar Gupta. Unpacking the assumptions and justifying principles of welfare in India, Jayal argued that the Indian state has adhered to a needs-based conception of justice in theory, while in practice following a philosophy of welfare based on ideas of charity and benevolence. Illustrating this argument with reference to the problem of hunger, she argued that in the Indian context rights could provide moral, legal and political force to welfare claims, inviting rather than warding-off state intervention to meet the ends of social justice. This is only facilitated by the fact that "since rights have not been central to the conception of welfare in India, they have also not been central to the critique of the welfare state", as in the west. Jayal examined two sorts of challenges facing the welfare state in India today: (a) the challenge from the proponents of marketisation and a minimal state; and (b) the challenge from votaries of group rights seeking a state that is selectively interventionist, e g, the demand for reservations in employment and education. The experience of historically disadvantaged groups demands that the task of rectifying such injustices be built into a model of welfare that is sensitive to the specific types of inequalities that obtain in India, not to a derivative catalogue of them.

Dipankar Gupta argued that the special needs of the underprivileged in society are most effectively addressed by invoking the principle of fraternity. Rights and entitlements are, he maintained, intrinsically related. To say that the former emphasises individual freedom and the latter social and redistributive justice is to forget the original conditions that gave birth to the language of rights. Criticising Rawls' attempt to arrive at a theory of justice or fairness through the initial condition of the veil of ignorance, Gupta argued that it would be more consistent to speak of a "thin theory of good", that is an emergent property of "a minimal set of resemblances", on which all societies are necessarily based. "This set of resemblances, once established, allows for individual freedom and the development of specialities. It also provides the grounds for justifying and legitimising claims and entitlements". Entitlements then are not to mop up the weak and keep the poor alive but to establish and even enlarge the minimum set of resemblances so that the moral core of societies may be consolidated. Seen from this perspective, entitlements are enabling devices for enhancing empathy and should not be understood as instances of sectoral sympathy. Reservations, as entitlements, should accordingly enable greater empathy in society, and allow those who had hitherto no attributes to cultivate them so that they can participate in the general conditions of empathy. If this is to be, then entitlement provisions should not be permanently attached to primordial groups for that would undermine those "minimal sets of resemblances" and promote instead 'thick' and contrary articulations of the good, sans empathy.

If the liberal idea of the political community as constituted by abstract individuals took no account of their cultural identities, community-based claims for rights and justice have gained momentum in recent years. In her analysis of the tensions between individual rights and group rights, Veena Das cautioned against overemphasising community rights which necessarily claim ownership over individual members. Drawing upon memories of "collective pain" and "secretion of victims", she said, they create a new text in which the biography of the individual self is completely subsumed by the equally imaginary biography of the group. The individual is thus subjugated to the

group and becomes hostage to a created past.

For Vineet Haksar, though some group rights have constitutional sanction—e g, affirmative action—rights are derived from humanity. Groups are not moral beings in the way that individuals are—they lack, for instance, the capacity to suffer and they have no phenomenology apart from that of the individuals who compose it, to whom all legitimate rights-claims are, and must be, ultimately reducible. Group demands for the protection of "ways of life" may even conflict with individual rights. The state, Haksar argued, should uphold liberal values and, in a multi-religious society, should also protect the essential values of different religions. These core values may be authenticated by consultations with religious leaders.

Javeed Alam drew attention to the fact that a politics of "collective personalities"—such as cohesive religious communities in search of identity or constellations of disadvantaged groups seeking empowerment—deny individuals what they claim for themselves and render the vocabulary of rights ineffectual, because it is individual-centred. The state, in turn, has failed in terms of its intolerance of class-based agitations, and its relative responsiveness to the demands of ethnic communities. It has also, in its withdrawal from welfare functions, rendered citizens vulnerable, and forced them to resort to support structures of kith and kin for material and emotional sustenance.

In his comments, A S Narang argued that we are continuously witnessing the emergence of new groups within the nation state. It is exceedingly difficult, in the affairs of everyday politics, to accommodate these diverse and sometimes conflicting points of view. We should, therefore, acknowledge and uphold the basic rights of individuals as human beings. Neera Chandhoke cautioned that in contemporary India, group, or, more appropriately; community identities and claims cannot be easily dismissed. The existence of communal violence and hatred reinforced perceptions of the self as a member of a community; and in these circumstances, the community provided both the sources of self-identity and security. She also pointed out that the attempt to reduce the group to an aggregate of individuals would only legitimise the game of numbers. Implicitly, this would forsake the commitment to minority rights, and such redefinitions of democracy could have serious implications in the Indian context.

In his valedictory address, Ravinder Kumar argued that the new political and economic agenda is likely to be powerfully influenced by the hitherto dispossessed sections of Indian society, viz, the minorities, the backward classes, and the harijans. On the economic front, the country was on the brink of collapse in 1991, when the state initiated reforms to globalise the economy, increase productivity and stimulate efficiency. The economic agenda of the 1990s should include substantial investment by the state in agriculture and agro-industry which, if located in district towns, can provide the basis of a more enduring federalism. Despite the growth of communal polarisation, he maintained, it had become clear that "the sacred compact" between people of different religious communities was as necessary today as it had been in the colonial and early post-independence period. The increasing self-assertion of the backward classes, and of the harijans, also heightened the awareness that poverty and deprivation require policies of affirmative action.

Reflecting upon the discussions that took place in the course of the seminar, two types of questions appear to have emerged suggesting significant lines of inquiry for future research by political scientists: (a) The first set of questions relates to the institutional and administrative arrangements required to effectively and equitably handle the new economic agenda of the Indian state. In the social sphere, too, we may ask, what sorts of political institutions are required by a multi-religious, multi-cultural society like India? Do we need to move away from the framework provided by secularism and the procedural republic? (b) Secondly, can the political theory of neoliberalism retain an emphasis on redistributive and welfare goals, and address the rights-claims and demands for justice of disadvantaged groups? Further, does the Indian experience warrant a justification of group rights, and in what way can these be accommodated within the framework of liberalism?

Some Good News, Much Bad

The World's Children

Thomas George

The authors of the UNICEF's annual State of the World's Children *reports do not, for the most part, swallow the nostrums of the World Bank, so eagerly lapped up by our own policy-makers.*

FOR much of the 20th century, countless millions of people all over the developing world—the majority of humankind—have watched their children dying, diseased and starving, while the fruits of humankind's labour and the triumphs of technology were being turned into military machines capable of wiping the human species off the face of the earth, not once, but many times over. As we rapidly approach the end of the century, the paradox of human achievement amidst such soul-destroying poverty is more poignant than ever.

Economists and policy-makers in the developed world and their fellow-travellers in the developing world, have never ceased to tell us that the causes of third world poverty are overpopulation, inefficient management, lack of enterprise, etc. All this mumbo-jumbo has become the received wisdom of the middle classes in countries like India. But the truth will be out.

It should come as no surprise therefore, that writers of the annual *State of the World's Children* reports published by the UNICEF do not, for the most part, swallow the World Bank's nostrums, so eagerly lapped up by our own policy-makers.

The good news is that measles, a major killer, is now on the wane. From 75 million affected children a decade ago, the number is now down to one million. Polio is on the verge of eradication and the World Health Organisation feels that eradication can be achieved by 2000 AD. Deaths from neonatal tetanus, will soon be a rarity. All this means that immunisation has now become widespread. Almost all developing countries have reached a coverage of 70 per cent or more; and the number is increasing (*State of the World's Children*, 1994). What this reveals is that it is possible to put a trained health care worker within reach of every family, on a sustained basis. As a logistical achievement it is unparalleled in human history.

But as we go to bed each day, the sun still sets on a world in which 35,000 more children have died. A world in which the new evil of the inhuman abuse of children in war has become just another statistic. A world in which starvation is the daily companion of the poorest quarter of the world's children both in the developing and the developed worlds, and just another picture on the television screen for policy-makers. This "last great obscenity" as last year's report called it, is made worse by the fact that it is absolutely needless. The resources and the technology exist today to banish malnutrition, poverty and ill-health forever.

However, the naive optimism of the 1993 report which saw the rolling back of socialism (of whatever kind), and the end of the cold war, as the beginning of a new era, of an "age of concern" has been replaced by a more realistic pragmatism of a growing realisation, that 'democracy' of the kind practised in the industrialised west, does not automatically confer prosperity on all its peoples, that the life-

style propagated by the power elites of these nations is neither desirable nor sustainable.

The report identifies, poverty, population growth and environmental stress ('The PPE Spiral') as the three major problems facing humankind. UNICEF pulls no punches in identifying the causes of poverty as "the industrialised world's policies on aid, debt, trade and finance which restrict the growth of employment opportunities". It quotes the Brundtland Commission (1987) report "Diversification (of the economies of the developing world) in ways that will alleviate both poverty and ecological stress is hampered by disadvantageous terms of technology transfer, by protectionism, and by declining financial flows to those countries that most need international finance" (p 31). The governments of the developing countries are not spared either: "(They) have given too little priority to the needs of the poorest."

UNICEF correctly identifies the solution: 'Growth from below', to be brought about by a combination of land reform, labour-intensive employment strategies, credit schemes, training opportunities, the right kind of technologies, investments to help maintain the stability and productivity of soils. The big boys at the World Bank must be laughing at the vain cries of little brother, UNICEF; for contrast this with: "Because cuts in government spending are usually central to an adjustment programme, health spending is likely to be reduced" (*World Development Report*, 1993) and the recommendation against food subsidies; "There is a strong case for government intervention to improve health by improving nutrition, but not for interfering generally in food markets, except in extraordinary conditions such as famine. In other words,'Throw the beggars a few crumbs'. The World Bank has a touching faith in markets which UNICEF does not share. "Market economics is not a panacea for social progress... if governments abandon their responsibilities then the result will be societies in which inequalities continue to increase and in which economic demand counts for everything and human need counts for nothing. The classic example is the US where, although the 1980s were a period of continuous economic growth, the poorest got no share in it.

Chicken and Egg

The report puts the right perspective on the population problem when it emphasises the organic link between poverty, deprivation and population. The causes that maintain a high birth rate are identified as: lack of progress in health care which makes people have many children as a form of insurance against the anticipated deaths of at least some of them; lack of status, education and opportunities for women, which is strongly associated with early marriage and frequent and prolonged childbearing; lack of minimal security which makes large families attractive as a source of support in emergencies; lack of investment in basic services and labour-saving technologies, which makes large numbers of children desirable, even essential, as a source of help in fields and homes; lack of family planning information and services; and lack of hope in the future, which is the great enemy of planning in general.

It is clear, therefore, that any amount of coercion or cajoling will not lead to a sustainable birth rate, unless the basic causes, poverty, deprivation and the lowly status of women are addressed. At forums worldwide, the governments of the industrialised west are championing the cause of the environment. However, the homilies about sustainable development are only for the consumption of the deprived. In their own countries they continue to promote a life-style such that 20 per cent of the world's population is responsible for 75 per cent of the world's energy use, 66 per cent of the green house gases and 90 per cent of the chlorofluorocarbons, that threaten the earth's ozone layer. Worse, by bullying and offering blandishment they maintain a world economic system that forces millions in the third world into farming marginal lands, over using fertilisers, felling forests, and other such practices which, today, have forced the world's ecosystem to breaking point. The paradox is that the present western life-style is unsustainable—the impact of an average American on the global environment is 35 times that of an Indian, 140 times that of a Bangladeshi, and more than 250 times that of a citizen of Sub-Saharan Africa—yet the 'American Dream' has been successfully sold and continues to be sold worldwide as the kind of life to aspire to. As the report pithily puts it "nothing could be more unrealistic than expecting millions of people to continue travelling by bullock cart and washing their clothes in streams and rivers before settling down to watch reruns of 'Dallas' and 'Dynasty'". UNICEF is realistic about the prospects. It quotes *Beyond the Limits* by Meadows, Meadows and Rendels: "A sustainable society would not freeze into permanence the current inequitable patterns of distribution. It would certainly not permit the persistence of poverty. To do so would not be sustainable for two reasons. First, the poor would not and should not stand for it. Second, keeping any part of the population in poverty would not, except under dire coercive measures, allow the population to stabilise." But, as the experience of India's "Emergency" showed, there are some governments who would like to try. Recently, Maurice King of the University of Leeds, has been expanding on his 'human entrapment' theory, which, by implication, suggests that measures to improve child survival should be withheld to the developing world, or else, due to falling death rates, their populations would grow beyond the capacity of their economies, and their populations will be 'trapped' in famine (Maurice King, 'Human Entrapment in India', *National Medical Journal, India*, 1991, 4:196-201) The sheer cruelty of the suggestion apart, it is based on shoddy social analysis as has been shown earlier in this article. So there is no shortage of people who would like to try coercion.

UNICEF feels that the way forward is a co-operative international effort to: resolve PPE problems by ending poverty, slowing population growth and improving the environment; changing life-styles in the industrialised countries in order to improve the quality of life while reducing the environmental impact, developing countries should also be able to aspire to the same life-style without exceeding the planet's capacity; and assisting all developing countries to develop the kind of economies and technologies which will allow them to pursue their chosen path of material development without overstepping local and environmental limits.

But are these objectives attainable? Is it reasonable to expect statesmanship of such high order? UNICEF thinks so. But it is one thing to believe that there is no alternative and quite another to believe that such fundamental changes will come about just because the rich and powerful see the wisdom of it. UNICEF undoubtedly has its heart in the right place, but its more powerful cousins, the World Bank and the International Monetary Fund, do not. Consider for, e g, their recommendation on the provision of safe drinking water, something which UNICEF considers extremely important in improving child survival: "Broadly based subsidies are not necessary for ensuring access to safe water ..." (*World Development Report*, 1993). Health benefits alone do not generally provide a rationale for public subsidy of water and sanitation. There are similar recommendations with regard to food subsidy and other welfare activities. Although the Bank admits that the effect of adjustment programmes are uncertain and may adversely affect the poor, they still suggest compression of social welfare spending. The horrendous results of these policies in Latin America have done nothing to dim their enthusiasm. Statesmanship and the industrialised west do not seem to be even nodding acquaintances Change is inevitable. But the course it will take may be quite different from UNICEF's projections. The end of history is nowhere in sight

TAMIL NADU

A Tax on Saraswati?

Though the sales tax on books proposed in the Tamil Nadu budget for 1994-95 has been withdrawn, an idea once mooted is relatively easy to revive. Saraswati might one day be actually required to contribute to the exchequer.

MOST budgets cause a flurry, in one section or the other, for one reason or the other. The much publicised outcry that followed the Tamil Nadu budget for 1994-95 basically reflected astonishment—that such an impost could at all have been considered, and that too in this state. The proposal was an extension of the sales tax network to cover the sale of books. The immediate reaction of the book trade was one of shock and disbelief, for more than one reason. That the idea was mooted despite the national priority given to the spread of literacy and education was one, for the proposal covered all books, not sparing textbooks and exercise books. And Tamil Nadu had been in the vanguard in the introduction of free primary education! Also, the government had demonstrated—very recently and quite generously—its concern for the book trade. When a fire destroyed most of the stalls in the annual Book Fair of Madras last January, the government came forward with an *ad hoc* grant to each affected party of Rs 12,500 as well as a further Rs 12,500 as an interest-free loan. As many as 100 stall-owners benefited from this largesse. Perhaps the unkindest out of all was that the suggested tax should have received the approval of the chief minister. Jayalalitha is well known as an avid reader and as the owner of a sizeable personal library. When further enquiry revealed that the proposal had its origin in a report prepared by B Vijayaraghavan, a senior IAS officer (since retired), astonishment reached a new pitch. For Vijayaraghavan is well known in the book circles of Madras as a scholar and frequenter of book shops.

Actually Vijayaraghavan had been asked some time ago (while he was still in service) to look into and report on all aspects of commercial taxes in the state. He had, in the course of this work, listed the items that were outside the tax network—which included books as also coconut fronds and firewood—without looking into the implications of an extension of the tax coverage. When the current year's budget exercise began, the bureaucrats apparently just tucked-in this list for additional resource mobilisation, again without analysis of the implications.

The levy proposed was not immoderate—3 per cent on the sale of books at the first point of sale which, with the surcharge, would have worked out to an effective 3.6 per cent. The attendant turnover tax was pitched at 2 to 3.5 per cent. What was lacking was an appreciation of the likely impact of the tax in the context of the structure of the book trade, especially as it operates in Tamil Nadu. A relevant vital fact is that there is no sales tax on books in any other state and the publishing and sale of books is a nationwide activity, with considerable inter-state movements. The seeming simplicity of a single-point levy disappears when it is seen that the first point of sale could be any one of the different segments of the trade—publishers, distributors, agents or retail booksellers. The shifting of the tax from the first point of sale to subsequent levels, ending with the book buyer, is fraught with difficulties arising from competition reflecting differences in commissions given, access to alternative sources of supply, etc. At the same time, no segment, it is claimed, can absorb the tax. Publishers in Tamil Nadu mainly bring out Tamil books. They are proprietary or partnership concerns and have to face the problem of large stocks because of the sluggish demand for their output. To them, the tax would have meant an intolerable burden. As for distributors and agents (suppliers to institutional buyers), their position is currently strong because they also serve book-shops and institutions in neighbouring states—a link that obviously cannot withstand the burden of a tax. Even book buyers in the state would resent the tax and seek to transfer their custom to tax-free zones. And it was not only the tax burden that bothered the trade hitherto unexposed to the tax authorities. There was, at all levels, worry over the hassles of compliance, accounting and book-keeping complications, with the need to maintain separate books for transactions within and outside the state.

Altogether, what was proposed was a messy tax—difficult to administer and possibly not very productive. No indication was given in the budget of its anticipated yield but enthusiastic overestimation seems likely. No data are available on book sales according to category but it is a reasonable guess that textbooks account for a goodish chunk. Government schools are provided with free supplies of textbooks and the addition of a tax to these would merely increase the subsidy.

Because of the nature of its ware, the book trade has always fancied itself as being in a unique position. And it has come to expect immunity from harassments such as taxation. This assumption received a rude shock in Tamil Nadu. Initially, many attributed it all to some reporting error—the reiteration of an exemption wrongly presented as a new impost. But soon disbelief gave way to distress and despair. Vociferous protests followed but the lurking fear was that the government would never go back on a proposal and lose face. Several distributors, agents and even booksellers began to plan to shift out of the state to neighbouring Pondicherry or Bangalore. To everyone's vast relief, however, within a week of the presentation of the budget, the government announced the withdrawal of the proposed tax on the sale of books (as also on coconut fronds and firewood). It was officially stated that the government "was anxious that the taxation should be minimal and not result in a burden to the poor". The Book-Sellers' Association attributed the success to its persuasive reasoning. Others said that the chief minister, furious about the slipshod preparatory work, had ordered the withdrawal.

Whatever the reason, books—an acknowledged symbol of the Goddess of Learning—have been spared for now. But there is a lurking fear too. The idea once mooted is relatively easy to revive. Tamil Nadu (then Madras) was the first state to introduce sales taxation. It could revive its pioneering spirit to be the first to tax book sales! Or other states could take up the idea. Sales of books are taxed in some other countries. Revered she might be even by iconoclasts, but Saraswati too might one day be required to contribute to the exchequer.

The Roots of Chiapas

Jonathan Fox

It is already clear that the Chiapas rebellion has transformed Mexican politics, from bottom to top. Although an authoritarian backlash is still possible, for now democratisation and social reform have moved to the centre of the national agenda. How could this have happened? And where might it lead?

JANUARY 1, 1994 was to be celebrated in Mexican history as the opening day of the North American Free Trade Agreement (NAFTA). The rebellion in Chiapas changed all that. According to Jose Juarez, leader of the Chiapas Union of Ejidos of the Jungle: "When president Salinas went to bed on New Year's Eve, he thought he was going to wake up a North American. Instead, he woke up a Guatemalan." While the government security forces were on leave or still asleep, as many as 2,000 indigenous rebels took over four major county seats, including the colonial capital of San Cristobal de las Casas. Not all were armed, but they displayed the uniforms, cohesion, and discipline of a well-trained military force. From their first 'Declaration of War', however, their strategy seemed clearly to be more political than military.

The rebellion caught Mexico's national leaders completely by surprise. When a small military confrontation last May led to news reports of secret training camps, the minister of the interior, a former governor of Chiapas, declared "There is definitely no guerrilla activity in Chiapas". That certainty was not shared in Chiapas itself, where underground military preparations were an open secret. When I visited San Cristobal last June, it was clear that an armed conflict was coming.

Still, the impact transcended expectations. No one imagined that an uprising in a handful of municipalities would open huge cracks in the national political system, shake the Mexican government to its foundation, and enable a vast array of social forces to seize the opportunity to pry the system open still further.

Mexican Politics Transformed

The red bandannas and dramatic declarations that provided the uprising with its popular imagery resonated with central America. Observers have long suggested that Chiapas—once part of Guatemala—has more in common with central America than with the rest of Mexico. And in terms of social polarisation, open racism, and the impunity with which local elites use repression, the resemblances are strong.

The Zapatistas, however, are not the central American revolutionaries of a dozen years ago. They do not propose to impose their alternative project on Mexican society as a whole, their official statements do not mention socialism, and their main political demand is for a government of transition to hold free and fair elections at all levels of government.

More fundamentally, Chiapas is part of a national political system quite different from any in central America: the ruling party is much broader, and civil society much stronger. The decisive political importance of these national differences was sharply underscored when, after less than two weeks of fighting, Mexico's president Salinas declared a unilateral cease-fire and sat down to negotiate. He agreed at least partially to the Zapatistas' conditions, and a political solution became possible. Mexican civil society and important factions within the regime were, for the time being, strong enough to hold off the initial military response.

To be sure, the regime remains deeply divided, and it is too soon to predict how the conflict will finally be resolved. But as I write in mid-March, the cease-fire has held, and negotiations have begun. The colonial Cathedral of San Cristobal was the first site of political negotiations between the federal government and the Zapatista political and military leadership, complete with ski masks and weapons. (The Mexican army had taken the position that only criminals wear masks. They apparently did not have the last word.)

The fate of these peace talks depends in part on two other sets of negotiations that grew out of the January rebellion. In Chiapas, a broad coalition of indigenous social and civic groups has formed to promote peace with justice and democracy. Many communities in the region in revolt, after months of assemblies and internal debate, divided over whether to take up arms. Now groups on both sides of the question have come together, and the federal government has given the new statewide network unprecedented respect and recognition. The government may have intended to isolate the rebels politically, but to no avail. The statewide coalition has declared support for Zapatista demands, though not their decision to take up arms. At the same time, a third set of negotiations—between the national government and the major political parties—has produced an agreement promising unprecedented democratic electoral reforms.

With negotiations moving forward both regionally and nationally, it is already clear that the Chiapas rebellion has transformed Mexican politics, from bottom to top. Although authoritarian backlash is still possible, for now democratisation and social reform have moved to the centre of the national agenda. How could this have happened? And where might it lead? The beginnings of answers to these questions lie in the economic and political life of Chiapas itself.

Untouched by Agrarian Reform

Chiapas is a region of large cattle ranches and coffee plantations, alongside tiny family plots; its notoriously unequal distribution of land remains largely untouched by agrarian reform. Indeed, Chiapas accounts for fully a third of the agrarian reform department's backlog of unresolved conflicts and land distribution decrees that were never carried out on the ground. For the campesinos, it is a backlog of broken promises. And their hope to see those promises redeemed within the system was dashed by recent reforms of the Mexican constitution. The government, moreover, for years unwilling to redistribute land in Chiapas, encouraged landless families to move to the Lacandon jungle, cut down the forest, and raise subsistence crops, coffee, and cattle. This policy produced a long and bloody history of land conflicts; uncounted dozens, perhaps hundreds, of community leaders have been murdered with impunity over the last two decades.

This class conflict is deepened and intensified by the racism of the Chiapas ruling elite. Discrimination in Chiapas is much more overt than in most indigenous regions of Mexico—until the mid-1950s, San Cristobal was literally an apartheid city.

The mainstays of the peasant economy, too, were in deep trouble in the period leading up to the rebellion. Prices for coffee, cattle, and corn were down and logging was banned (at least for peasants). These problems aggravated long-term crises of the regional peasant economy, including a shortage of land and erosion in the highlands and poor soils in previously forested lowlands. Meanwhile, the national government slashed farm support programmes—agricultural credit and technical assistance—deepening the regional economy's downward spiral.

NAFTA: 'A Death Sentence'

The insertion of NAFTA into these already unpromising conditions signified a deepening of rural problems—the end of

land reform, increased polarisation within Mexico between north and south, and the exclusion of indigenous peoples from the national debate. The trade opening especially threatened corn, a crop with great symbolic as well as economic significance. The intense debate about NAFTA in the US also may have prompted the Mexican government – more worried about international embarrassment than local turmoil—to pretend that nothing was happening in Chiapas. In fact, some analysts suggest that Salinas appointed the hard-line governor of Chiapas, Patrocino González, to become minister of the interior precisely to keep the lid on during the NAFTA debate. González would have run the 1994 presidential elections, had he not been removed as part of Salinas's turn to a political solution.

By launching the revolt on the first day of NAFTA, the Zapatistas guaranteed themselves international press attention. Their official statements stressed that their main goal was simply to draw attention to the political and economic crisis in Chiapas. And Subcomandante Marcos's charge that NAFTA is a 'death sentence' for Mexico's indigenous peoples became the emblem for the rebellion. Some US specialists on Mexico were puzzled by this emphasis on NAFTA. One said that it could not be an indigenous rebellion: how could Indian peasants know about NAFTA? Another suggested that the timing was just a coincidence. The experts ought to have known that the pro-government media have been trumpeting the onset of NAFTA throughout the country for a long time.

But there is a puzzle here: if the rebels' main goal was to attack NAFTA, they would have launched the uprising the week before the US congressional vote instead of waiting for the treaty to take effect. Still more fundamentally, the grievances that led to the rebellion cannot be understood exclusively by reference to the rural economic crisis and NAFTA. For, although their effects were felt throughout rural Mexico, only Chiapas rebelled. What, then, is different about Chiapas?

Underlying Political Problem

Part of the answer is politics. Consider the Zapatistas' two main targets. While in command of the region's power centres, they destroyed the town halls and the police stations, but touched little else. In Altamirano they whacked away at the 'municipal palace' with sledgehammers for two days. Before the army began sweeping through the region last spring, the main sources of repression in Chiapas were the local and state authorities—police under the control of 'elected' officials. Since the mid-1980s, Amnesty International, Americas' Watch, and Minnesota Advocates for Human Rights have documented a systematic use of torture and political violence by the state and local police.

The problem of repression in Chiapas came briefly to national attention in 1992 because of an indigenous march from Palenque to Mexico city (a distance of about 1,000 kilometres). The protest was called Xi Nich—the 'Ant March'—and with support from the progressive church the marchers made it to the gates of the capital, prompting national authorities to negotiate. The government promised to meet many of the demands, but after the marchers returned home few agreements (they charge) were ever carried out.

The underlying political problem in Chiapas is the lack of free and fair elections for all levels of government: basic freedoms are not respected and election numbers are regularly cooked. According to a study of the 1988 presidential elections by the non-partisan Fundacion Arturo Rosenbleuth, the remote rural Ocosingo federal election district—one of the centres of the uprising—reported one of the highest rates of voter turnout in the country: Of those on the rolls, 81.5 per cent reportedly voted, a figure well above the reported national turnout of 50.3 per cent. When compared with the population figures, this meant that 99.5 per cent of the voting age population of the district voted, giving Salinas 95.6 per cent of their votes. Borrowing from Gogol's *Dead Souls*, the official 1988 rolls included more than 105 per cent of the voting age population in another 35 rural election districts around the country, including 125 per cent of the adult population of the Comitan district, also one of the areas in revolt.

As the turnout numbers suggest, these authoritarian enclaves are not simply remote rural backwaters, cut off from national politics and as yet untouched by the government's modernisation project. As national elections are contested more and more, the winning margins narrow. So the national leaders of Mexico's ruling party need these controlled districts more than ever. Authoritarian enclaves made the difference in the 1988 presidential race, and could swing the vote in 1994 as well. That is why Chiapas is so important: the struggle for political democracy at the national level depends on the fight for local democracy.

But politics in Chiapas is not simply a matter of electoral fraud; force, too, plays a central role. The political class in the Chiapas state government is especially authoritarian, and recent governors have been particularly brutal—which led the Zapatistas to take one as a prisoner of war. This general-turned-rancher was later released unharmed, to facilitate the negotiations. The governor at the time of the rebellion (a political appointee, now also fallen) was especially irritating to the citizens of Chiapas because he was considered an imposed foreigner—Elmar Selzter Marseille, from a plantation family of German descent. His charges that the rebellion was 'foreign-inspired' were not well-received.

More immediately, political conflict last fall convinced many that prospects for peaceful change within the system had closed up, contributing to the popularity of the Zapatistas among the indigenous peoples of Chiapas. Right-wing forces in the Mexican government, together with the Papal Nuncio and his allies in the Catholic church, openly tried to have Bishop Samuel Ruiz removed from the diocese of San Cristobal. Don Samuel is the 'Archbishop Romero of Chiapas', a towering figure whose defence of the rights of the indigenous is legendary. He organised the first statewide indigenous congress in 1974, in honour of Fray Bartolome de las Casas, the chronicler of the conquest and first European defender of indigenous rights. Much of the rich web of social organisations built by the indigenous peoples of Chiapas trace their origins to this first taste of freedom of expression and assembly. The public attacks on Don Samuel brought over 15,000 indigenous people down from the mountains to march in his defence through the streets of San Cristobal last fall—the largest protest in the history of Chiapas, even larger than the 1992 protest against the 500th anniversary of the Spanish conquest.

History, Interest and Conviction

If poverty and authoritarianism explain what makes rebellion possible, they do not explain why rebels choose to take the extraordinary risk of directly confronting state power. Who, then, are the Zapatistas? What mix of history, interest, and conviction brought them together?

Contrary to early claims by the government about foreign involvement, the Zapatistas are Mexican, mostly indigenous. Some Mexican participants may well have had combat experience in central America, but no evidence of foreign participation has been presented. Starting with their 'Declaration of War', the official Zapatista communiques are written in the tradition of the Mexican Revolution, citing Article 39 of the Constitution which vests national sovereignty in the people.

The Zapatistas' early origins are quite murky, but for at least a decade they have sunk roots in rural Chiapas and possibly elsewhere in Mexico. They organised in total isolation from the rest of the Mexican left, and reliable information about them is very limited. Politically, they may have begun as a convergence of splits from an influential neo-Maoist political group called Politica Popular with more central American-style revolutionary ideas. Recent re-

ports suggest that since the end of the cold war their ideology has shifted much closer to the mainstream of Mexico's broad democratic movement. Since the rebellion, all their official public statements call for constitutional democracy and social reform. Their initial 'Declaration of War' called for the "Powers of the Nation" (the legislature and judiciary) to "restore the legality and stability of the nation by removing the dictator [meaning Salinas] from office". In Subcomandante Marcos's words, "we demand the formation of a new government of transition that would convene free and democratic elections for August 1994". They deny that they are trying to impose their project on Mexican society by force.

More radical demands have been heard from fragments of interviews with militants on the ground. This may reflect differences between leadership and base, or political differences within the Zapatista Army(EZLN). Given the alphabet soup of Chiapas rural politics, it would not be surprising to discover that several distinct groups came together in recent years to form the EZLN.

Whatever their ideological roots, the Zapatistas gradually won over many activists who had long tried organising for change within the system. Chiapas is full of independent peasant organisations, many with two decades of tough organising behind them. Some are spiritually-inspired while others are more secular. Some focus on community economic development projects while others are more culturally and ethnically identified. Some are affiliated with national groups, like the National Network of Coffee Organisations, the National Union of Autonomous Regional Peasant Organisations, the Independent Central of Farmworkers and Peasants, The National 'Plan de Ayala' Network, and the Independent Front of Indian Peoples, while others prefer to stick to local and regional alliances. Some fight for land rights and against human rights abuses, while others steer clear of such dangerous issues.

The Zapatistas come out of this world—a dense network of associations seeking to change the system but consistently encountering more repression than reform—and they have already helped to transform it. Until the January uprising, the community-based indigenous and peasant organisations of Chiapas had operated largely independently from one another But in the wake of the January uprising and the political space it opened up, they have come together in a statewide network of unprecedented political breadth and diversity.

In spite of the Zapatistas' clearly local roots, government spokespeople have sought to discredit the movement by claiming that it cannot be truly indigenous. Indigenous revolts are supposed to be 'spontaneous', but the January events were well-planned in advance. The government alleges that the many indigenous people who participated were actually duped by non-indigenous professional revolutionaries. Indigenous peoples are also supposed to have only local, immediate demands; the official view is that they are not concerned with national politics. For this reason, the Zapatista emphasis on political democracy is offered as conclusive evidence that this is not an authentic indigenous movement.

In response to government charges, the Zapatistas claim that their top leadership is exclusively indigenous. This message was a bit muddled since their principal spokesperson, Marcos, is not indigenous (though he has made it clear that he is merely a 'Subcomandante'). When the top leadership met with the press for the first time in early February, though, the confusion began to clear up. Spanish is a foreign language for all of the leaders—indeed, Commandante Ramona reportedly speaks only Tzotzil. They affirmed that their Clandestine Revolutionary Indigenous Committee is the highest political authority, though Marcos is the main military strategist. They said that Marcos is their spokesperson because "he has such a facility with Spanish. We still have a helluva lot of trouble with it. That's why we need him to do lots of things for us. ... But we make the political decisions." No one seems to know who Subcomandante Marcos is, other than those who have pointed out that his name stands for Margaritas, Altamirano, Rancho Nuevo, Comitan, Ocosingo and San Cristobal, the main towns in the zone of conflict.

Moreover, the Zapatistas' initial de-emphasis of ethnically-specific demands may reveal more about the extreme complexity of the ethnic map of the main region in revolt than about the social origins of the EZLN. The Canadas region is an area of relatively recent settlement, mostly by indigenous homesteaders from other parts of Chiapas, especially from the densely-populated Altos region, but also by some *mestizos* from other Mexican states. Thus the different ethnic groups are not settled in their own geographically and culturally distinct areas. The result has been a great deal of inter-ethnic mixing, and Tzeltal has reportedly become a lingua franca, along with Spanish. This mixing may help to explain why the rebellion shows signs of a broader pan-Mayan identity. It also accounts for the relative absence of ethnically-specific demands based on primordial claims to the region where they live, and for the central place of the demand to be treated as full citizens of Mexico—though the Zapatistas have recently proposed the creation of indigenous co-governors, as counterweights to *mestizo*-dominated state authorities.

Military Response and Its Reversal

When the rebellion began on January 1, the government was initially paralysed by surprise. Eventually, more than 12,000 troops were sent in from all over the country. In most of the towns occupied by the rebels, the army waited for them to leave before moving in. In San Cristobal, the rebels left at six in the morning, just as they had arrived, with no combat. The army arrived at six that afternoon. In the end there were relatively few battles, though it took the army some time to dislodge the rebels from Ocosingo, and the EZLN kept the army pinned down for several days at the Rancho Nuevo military base.

By January 6 the president made his first public appearance, taking a very hard-line stance The government was trying a military solution, complete with widespread torture, disappearances, and reports of secret graves. Soon, however, the combination of international and domestic pressure for a peaceful solution led Salinas to change strategy. In a clear shift from the post-NAFTA afterglow of positive news coverage, the international press was, from the beginning, remarkably critical of the Mexican government. Liberal US advocates of NAFTA, having bet heavily on its democratising impact, were relieved when president Salinas declared a unilateral ceasefire. He called in the former mayor of Mexico City, Manuel Camacho, runner-up in the secretive inside competition to become the ruling party's presidential candidate, to head a peace and reconciliation commission. Camacho is widely respected for his political negotiating skills, and has important family ties to Chiapas. He immediately called on Bishop Ruiz to help. As Camacho came back into play, after having lost the most important political game in town, speculation spread—with Camacho's encouragement—that he might re-enter the race for the presidency. Some Mexico city conspiracy theorists even suggested that Camacho himself was behind the revolt. (A more plausible conspiracy theory would predict efforts by powerful opponents of serious political change who remain entrenched within the state to throw a monkey wrench into the delicate peace talks.)

Within civil society, the government's early hard-line response had the unintended consequence of mobilising and unifying a broad, disparate range of groups, including the Catholic church, independent print media, a nascent human rights movement, non-government development organisations, indigenous rights groups, and national political parties. A small announcement published in Mexico's most important newsweekly gives a sense of the response. It comes from the Mexican Centre for Children's Rights: "Now is the time for us to

know who we are. Thanks to the EZLN for the days of light you are giving us." The response was so strong that when Salinas first announced his shift to a political approach, he described it as a response to the calls for peace from civil society, suggesting that their pressure helped to tip the balance in the secret, high-level debate over military versus political solutions.

Remarkably, even strong critics of the Zapatistas and their big city sympathisers have recognised the legitimacy of their demands. Reacting to a government offer of amnesty, Subcomandante Marcos asked: "Why should we be the ones to ask for pardon?" Acknowledging his eloquent challenge, Nobel Prize-winning writer and Zapatista critic Octavio Paz said, "it really moved me---it's not the Indians of Mexico, but we who should be the ones who ask for pardon. I don't close my eyes to the responsibility of our authorities—especially those in Chiapas--nor to the no less serious responsibilities of the selfish and narrow-minded comfortable classes of that rich province. But the responsibility also extends to Mexican society as a whole. Almost all of us, to a greater or lesser extent, are guilty of the iniquitous situation of the Indians of Mexico, since we have allowed, with our passivity or our indifference, the extortions and abuses of the plantation owners, the ranchers, the caciques [local bosses] and corrupt politicians."

One of the most influential institutions in civil society, the Catholic church, has responded by closing ranks in support of Bishop Ruiz. The earlier attacks against Ruiz appeared to fit the classic central American-style image of church hierarchy versus liberation theology. But things turn out to have been more complicated. The church's institutional interests were involved, since the Pope's Ambassador, a foreigner, had pushed the top leaders of the Mexican church aside to become president Salinas's main church ally. He also angered many bishops by agreeing to accept the government's story about the 'accidental' airport murder of the Cardinal of Guadalajara (by machine gun at point blank range). Now that Ruiz has become the key link in the new peace talks, the balance of power within the Mexican church seems to have shifted to the national authorities.

Will Government Keep Its Word?

Prompted by economic distress and political subordination, rooted in a rich network of regional associations, and protected by a broader Mexican civil society, the Zapatista revolt is as important as the student movement of 1968, citizens movements after the Mexico city earthquake, or the 1988 movement for democratic presidential elections. As pro-democracy elements within the church have increasingly joined with human rights, civic, grass roots and indigenous movements throughout Mexico, civil society seems to have gained strength in its long-term, two-steps-forward/one-step-back struggle to weaken authoritarian rule.

One sign of this progress is the government's pact with the national political parties. It promises independent oversight of the election commissions, independent auditing of the voter rolls, fairer access to the media, and lower campaign spending ceilings. Whether the government will keep these promises is another matter, but the broad sympathy for the Zapatistas throughout urban as well as rural Mexico indicates that the government will pay a very high price if it commits fraud in the upcoming presidential elections.

At the bargaining table in Chiapas, the government preferred to deal with local and regional issues, making national concessions only on some general principles to defend indigenous rights. That approach misses the point, and could carry dangerous implications. As Bishop Ruiz put it, "From the beginning the Zapatistas raised national issues... Those who think they can isolate the problem of Chiapas from the national context as the way to solve this problem didn't understand anything. This is a problem that is raised to the national level because the indigenous are not only in Chiapas. Their situation is the same all over, and all of them have been identifying with the [Zapatista] cause, though not with the means." As of this writing, an agreement has been reached and the Zapatista leadership is consulting their rank and file. They seem to be relying on civil society in the rest of Mexico to further the struggle for democratisation at the national level. But the draft agreement—now being debated in the villages—does not seem to require them to turn their weapons in. They may simply wait and see whether the government fulfils its promise of a free and fair election in August.

The Zapatistas are not going to accept the usual promises, and if peace talks break down the revolt could spread, well beyond Chiapas. Indigenous peoples represent at least the bottom 10 per cent Mexican society. According to one rank and file Zapatista militant near Guadalupe Tepeyac, "we don't know much about the proposals, but even if we did, that wouldn't be enough. I think that agreements have always been paper that the government takes to the bathroom. I want to see what happens to the land. That's why Emiliano Zapata died."

When asked what happens if the negotiations break down, he replied: "If they break down, they break down. We're here. Then we'll play our role. We'll see who's more ready. Maybe the army soldiers are more ready to die. Or maybe we're more ready to die."

Women's Movement within a Secular Framework

Redefining the Agenda

Flavia Agnes

The riots in Bombay which followed the demolition of the Babri masjid dealt a severe blow to the premise that women have a separate existence away from their communal identity where they can discuss problems of rape, divorce and maintenance on a common platform. If social action means reacting to external social reality, then as the external reality changes internal positions have to be redefined or else the movement will become redundant in the face of the newer challenges.

BOMBAY has the reputation of having been the home of many progressive social movements during the pre-independence and later. Although the first communal riots recorded in the history of Bombay took place in 1893,[1] the city grew into an industrial capital and acquired a cosmopolitan image, with the migrants providing the necessary vibrancy for the growth and expansion of the city. This character of the city made it possible for many refugees to take shelter here after partition. The riots during the later period did not affect Bombay in any significant way. Hence the scale and intensity of the riots which followed the demolition of the Babri masjid at Ayodhya took Bombayites by surprise. They dealt a serious blow to the cosmopolitan and progressive image of the city. The city which had welcomed with open arms refugees of all natural and man-made calamities and provided them with the basic minimum means of sustenance witnessed a large-scale exodus. Many of its age-old trades as well as its endeared traditions went up in flames with the tacit approval of thousands of spectators.[2]

The riots posed a new challenge to the social movements in the city. And sadly, they failed miserably. It was evident that building a counter secular force had not been in their agenda and hence they could not counter the rising wave of communal passions. The feeble voice raised by a few groups was drowned in the sea of venom and hatred into which the city had plunged. Even worse, some trade unions and community organisations became the fertile collective on which this venom was nurtured and nourished.

As the city 'went back to normal' and the organisations tried to pick up the threads they sensed a sharp cleavage. The beneficiaries of a programme or the members of a union had been divided into two sectors—the majority and the minority. The question foremost in the minds of secular-minded persons was an obvious one, 'Why did this happen... and when...? And where did we go wrong?' Did the venom of communalism spread overnight? If not, did the movements themselves consciously or unconsciously participate in this process? The riots affected different social movements in different ways. Since my work has primarily been within the women's movement, I am posing the questions within its confines.

Women's Movement in India

Around late 70s and early 80s the autonomous women's movement began to take shape mainly around the issue of rape and bride burning. The groups which mushroomed in various cities consisted of women from left and liberal backgrounds many of whom were professionals from middle and upper strata of society.[3] To focus attention on the issues, women walked the streets in protest marches shouting slogans. The initial spontaneous protest marches led to more sustained activities like counselling centres and support services.[4] Women from both lower and middle strata approached the centres for help in a crisis situation. These centres subscribed to a pro-women ideology which can be termed as broadly feminist, although some groups refrained from using this term. They challenged the traditional and conservative role of women as subordinate partners within domestic and social relationships.

Although the groups remained small in number, the movement was highly visible as it received wide media publicity. This acted as a pressure tactics and the state was forced to respond. Women's issues were placed on the agenda of state-sponsored developmental schemes, social work programmes and sociological research. The government set up anti-dowry police cells to help victims of domestic violence. There were also several cosmetic efforts at legislative reforms although the inadequately formulated laws did not have the desired effect.[5]

While the counselling centres remained at the crisis intervention level, several community organisations and non-governmental agencies (NGOs) formulated programmes to address the economic issues concerning women particularly in the unorganised sector. Some of these NGOs were headed by women who subscribed to this new ideology and hence were able to transgress the narrow boundaries of 'women's welfare' and incorporate the new concept of 'women's empowerment'. Although they did not directly challenge the subordinate role of women within marriage nor address 'personal' issues like domestic violence, they indirectly helped in the empowerment of women through developmental work.[6]

The autonomous women's movement focused on issues which challenged the patriarchal power structures within a broad liberal framework. There were several instances where the movement addressed issues concerning dalits, tribals and landless labourers.[7] The movement was also active in providing relief during communal riots and worked in broad secular forums.[8] During community conflicts resulting in police excesses or during human tragedies, it was able to place gender concerns on the agenda of human rights and civil liberties.[9] But overall, it worked from a presumption that gender lines can be drawn up clearly and sharply in a patriarchal society and within these parameters sexual assault and domestic violence affect women equally across class, culture and religious barriers.

Secular Culture as an Agenda

The leaders of this autonomous movement remained predominantly urban and upper class Hindu. Their work centred mainly in areas away and outside their own immediate neighbourhood and community context. In order to reach out to women from a different class, caste and culture and to propagate the new ideology of the strong and assertive woman, the movement adopted a populist approach and relied upon mythical symbols of 'shakti' and 'kali' to convey the newly-constructed feminist ideology. The movement relied more upon myths and fictions rather than on the history of a pluralistic society encompassing within its framework cultural idioms of minority commu-

nities The intention of using the symbols from the dominant culture was not to propagate the Hindu ideology But since the movement did not have 'secularism' as one of its prime objectives no conscious efforts were made to evolve alternate symbols Hence the cultural expressions with which the women who were in the forefront were familiar had surreptitiously crept into the women's movement

The feminist movement also had to constantly counter the allegation that it was 'western' So in order to establish the 'Indianness' of the movement it relied on Hindu iconography and Sanskrit idioms denoting woman power thus inadvertently strengthening the communal ideology that Indian, Hindu and Sanskrit are synonymous Within this social milieu of a high caste Hindu culture the handful of minority women who were vocal and articulate had also internalised the dominant culture and hence did not protest against this trend In order to prove their secular credentials they willingly divorced themselves from their own traditions and cultural symbols of women's strength and power and accepted not just cultural symbols but even food habits and dress codes of the dominant section

With the women's concerns gaining prominence in both governmental and non governmental organisations during the 80s, women's issues became an important agenda for all political parties Initially political parties refrained from raising issues of domestic strife and male dominance within party organisations The women who needed support against violent husbands or male colleagues had to approach a women's organisation to deal with this issue This conservative approach was maintained not for traditional and reactionary reasons of preserving the family but more in order to preserve the existing *status quo* within party cadre But over the years some party-affiliated women's organisations started addressing issues of women's oppression within the family through counselling centres [11]

In Bombay, during the mid 1980s, the communal party Shiv Sena which was gaining popularity among the lower middle class was able to mobilise a large number of women around support activities like income generation creches and mid day meals for children civic amenities, ambulance services etc The movement also appropriated cultural forums of public celebrations of Hindu festivals like *Ganesh Utsav* and *Satya Narayan Pooja* which were popularised by Tilak during the nationalist struggle in the pre independence era In addition the 'son of the soil' theory propagated by the Shiv Sena had also managed to attract women—as mothers of these sons of the soil women were bestowed a special role and responsibility Through a systematic hate campaign the Shiv Sena was able to whip up communal tensions among its women cadre The image of the modern Hindu woman which was constructed while advocating the communal Hindu ideology was not the traditional subservient and docile domestic being but a new modern *Durga* the destroyer of evil, an angry and rebellious woman This construction of the modern Hindu woman resembled very closely the Indian construction of the new 'feminist' woman This new woman could come out on the street with men from the community to avenge the wrongs And in this action she had the blessings of the political party and the community leaders Hence women found this role not only exciting but also more comfortable in comparison to the protests against a violent husband or a rapist from within the community because then they would not have the protective mantle of the party nor the blessings of the community elders

Though the ideology of the feminist movement could not be transmitted Hindu communal forces usurped the external usages popularised by this movement of protest marches and road blocks which are contrary to the conservative domestic role of the traditional Hindu woman The irony lay in the fact that the communal parties were able to mobilise women far more easily using the image of the modern Durga than the movement which had popularised these forms in the first place

To its dismay the women's movement found that the new found strength, the *shakti* of the modern Durga was not directed against violence within the home and community but externally towards the Muslims both men and women In this process the myth that all women are equal and could be mobilised around a common issue on a common platform lay shattered Hence slogans such as 'sisterhood is powerful' or 'hum sab ek hai' (we are all united) lost their relevance But what was even more distressing was that women from communal organisations mouthed slogans coined by the women's movement 'hum bharat ki nari hai phhol nahi chingari hai' (we are the women of India not delicate flowers but fire flames) while leading the demonstrations during the riots or while the Babri masjid was being torn down

Merging of Demands

The merging of lines between communal forces and women's organisations did not stop at an abstract level of symbols and slogans but also found an expression through some of the more concrete demands raised by the movement

Obscenity is one such issue The women's groups had taken up a campaign against obscenity in the media The aim was to protest against using women bodies as sex objects or in derogatory and subservient roles The campaign received the support of people from varied tendencies—from Victorian moralists to Hindu revivalists The issue became very popular with communal parties In Bombay the women's wings of the Shiv Sena and BJP organised demonstrations and stormed the Doordarshan studio to protest against the late night screening of classic films on the television including films which portrayed an assertive woman In the hands of communal forces the issue took a dangerous turn - of imposing informal censorship curtailing freedom of speech and expression for secular issues In an agreement signed by the Film Makers Combine (FMC) the producers of Hindi cinema have given an undertaking that they will not portray the demolition of Babri masjid the performances of maha aratis (which ignited communal frenzy in Bombay in the month of January) or any other issue hurting Hindu sentiments along with an undertaking not to portray images of women in derogative roles

The second such issue is the demand for a uniform civil code The women's movement had a sustained campaign for reforms within the segregated and religion based marriage laws and pressurised the state to evolve a non sexist secular code This demand found an echo in a similar demand by the communal forces The family laws in India are termed as 'personal laws' and are divided along religious affiliations rather than territorial jurisdiction Even after independence no effort had been made to evolve a uniform civil code in spite of the constitutional mandate The ruling party, in order to lure the minority vote continued to sacrifice the rights of minority women Examples of this tendency can be found in laws governing Christian and Muslim minorities The only exception is the recent reform in laws governing Parsis [11]

The archaic and anti-women Indian Divorce Act was enacted by the British in 1869 to facilitate the smooth functioning of the colonial regime But today it is applicable to Indian Christians (who are referred to as 'native Christians' in the act) Under Section 10 of the act while a man can get divorce only on the ground of adultery the woman has to prove an additional ground such as cruelty or desertion [12] Repeated pleas to change this oppressive provision by Christian Women's organisation[13] as well as recommendations by the Law Commission have fallen on deaf ears [14]

In a similar vein the Dissolution of

Muslim Marriages Act of 1939 governing the divorce of Muslim women which has no provision for custody of children or for maintenance has remained unchanged. Further, the customary privilege of the Muslim male to a unilateral 'talaq' is held valid in spite of protests from Muslim Organisations.[15] But the most stark example of this tendency was the passing of the Muslim Women (Protection of Divorce) Act 1986. A judgment in 1985 popularly known as the Shah Bano judgment[16] which reaffirmed the divorced Muslim woman's right to maintenance aroused the wrath of the leaders of the Muslim community because of certain adverse comments made by the judiciary against Islam. The adverse campaign led to passing of laws which deprived divorced Muslim women of their hard won right to maintenance under a secular code.[17]

It was not surprising that the demand of uniform civil code raised by the women's movement aroused contradictory response from fundamentalists depending upon whether they hail from the majority or the minority communities. It was opposed strongly by Muslim and Christian religious leaders who perceived it as a threat to their cultural identity and violation of fundamental rights guaranteed by the Constitution.[18] But it became an important plank upon which the hate for the Muslims could be ignited. Through it, the Hindu communal organisations were not only able to gain popularity amidst the Hindu male who envied his Muslim counterpart for his freedom to practise polygamy[19] but could also pose as the champions of women's cause.

There was a very clear difference between the demand made by the women's movement which was based on a pro-woman, secular and non-sexist ideology and the anti-Muslim demand of the communal forces. But this did not clearly manifest through well-publicised campaigns. Although most of the initiators of the movement were culturally Hindu they perceived themselves as secular beings. Hence they did not focus sharply and minutely on the Hindu code and the challenges to the sexist bias within it.[20] But at the other level the movement could rally around important cases initiated by a few minority women challenging the sexist biases within their personal laws.[21] This resulted in the women's movement focusing primarily on lacunae within laws governing minority communities.

Perhaps a few examples of the extent of sexist biases within laws governing Hindus are necessary to clarify the issue. The first and concrete example is the Hinduisation of the Special Marriages Act. While the Muslim Women's Bill which deprived Muslim women of their right to maintenance under a secular code was strongly criticised, the amendment of 1976 to the Special Marriages Act of 1954 went unnoticed. This was the forerunner to the Muslim Women's Act and the first instance after independence when the trend towards uniform secular code was reversed. A religious group was taken out of the purview of the secular code and placed within the purview of a code based on religion. By this amendment if two Hindus married under the Special Marriages Act then the secular code which granted equal rights to men and women—the Indian Succession Act of 1925 would not apply to them and parties continued to be governed by the Hindu Succession Act which ensured male coparcenary rights.[22]

The amendment was both anti-women and anti-minority. It sought to protect the property interests of a Hindu male who married any woman within the broad Hindu fold by not depriving him of his coparcenary rights. Since the concept of coparcenary (through which a male member by birth becomes a partner in the ancestral property and a woman can never be a coparcener) *per se* is anti-women this amendment was *de facto* against women's rights. At the other level it served as a deterrent to a Hindu male wishing to marry a woman from the minority religious communities because then he could be penalised by forfeiting rights to his ancestral property. This amendment aroused no public furore from progressive organisations. Perhaps it is apt to point out that this amendment was passed at a point in history when the legislature enacted major changes in laws governing women's rights, as a response to the Status of Women Committee report of 1974 *Towards Equality* and the International Women's Year, 1975.

Several other lacunae within the Hindu Code also went unnoticed. For instance the procedure of solemnising the Hindu marriage at one level remained brahmanical, but at the other level the code validated customary rituals and ceremonies. To this confusion the Hindi films have contributed their bit by creating a fiction that exchanging garlands or applying 'sindoor' to the forehead of the girl constitutes valid marriage. This confusion coupled with non-registration of marriages has enabled the Hindu male to contract second marriage with impugnity.

In a divorce proceedings, a Hindu male can, at his whim and fancy admit either his first or his second sexual relationship as a valid marriage. This places the woman in a polygamous relationship extremely vulnerable, while it permits the man to enjoy the fruits of the relationship without any financial responsibility. When the man refuses to validate the marriage, the woman loses not only her right to maintenance but has to face humiliation and social sigma as a 'mistress'. So much is at stake for the woman that it is not an uncommon sight at the family court in Bombay for two women who are vying with each other for the status of a wife to come to blows.

Only the Hindu Marriage Act permits the scope for ambiguity regarding the solemnisation of marriage. Under other laws the officiating priest has to provide the necessary document by way of a 'nikha nama' or he is required to register the marriage with the Registrar of Births, Deaths and Marriages.

In criminal prosecutions for bigamy under Section 494 of the Indian Penal Code, years of litigation fails to end in conviction for the errant male due to the courts adopting a rigid view that only Saptapadi and Vivahahoma are valid marriage ceremonies.[23] If these ceremonies could not be proved in the second marriage the courts held that the second marriage was not valid even though the couple is living as husband and wife and the community accepts them as such.[24] Hence the progressive sounding provision of monogamy not only turned out to be a mockery but in fact even more detrimental to women than the uncodified Hindu law which recognised rights of wives in polygamous marriages.[25]

Continuation of coparcenary concepts within the Hindu Succession Act denied of equal property rights and the right to ancestral home and property.[26] The daughters had equal rights only in the self-earned property of their father. This provision made it easy for men to turn their self-earned property into a joint property and deny women property rights. While introducing the provision of property rights to women in parliament, this lacuna was pointed out to appease the Hindu revivalists who had vehemently opposed the provision granting property rights to women.[27] Some southern states like Tamil Nadu, Andhra Pradesh and Karnataka have tried to rectify the discrimination to women through state amendments.[28]

Under the Hindu Adoption and Maintenance Act, a Hindu wife can neither adopt nor give her child in adoption.[29] The father remained the natural guardian of the child under the Hindu Guardianship and Adoption Act. But based on the deep rooted desire to control women's sexuality, the law continued its distinction between legitimate and illegitimate children and made mothers the natural guardians of their illegitimate children absolving the fathers of any moral responsibility towards the child.[30] While at one level equal property rights were denied to the Hindu woman both in ancestral as well as marital home, under some strange and perverse notion of equality a Hindu woman was called upon to pay maintenance to her

husband a provision which thankfully was non-existent in other personal laws [11]

But unfortunately none of these anomalies and anti women bias within the Hindu code received wide media publicity They remained hidden in statute books and legal manuals The women's movement did not rally around litigations challenging these anti women biases in its campaign for a uniform secular code Hence the demand by the women's movement could not clearly position itself away from the sexist Hindu code So by default, the movement contributed to the fiction popularised by the fundamentalist that the Hindu Code is the perfect family code which ought to be extended to other religious denominations in order to liberate women

The women's movement could not allay the fears of the minorities that the Hindu code would not be thrust upon them under the guise of 'uniformity' in order to crush their cultural identity Hence the brunt of this default will have to be borne by women from minority communities who are already burdened under sexist and archaic laws The severe opposition from fundamentalists of both Christian and Muslim communities to the uniform civil code and assertion of their cultural identity means further obstacles to the rights of minority women

Till recently women leaders of communal organisations have been advocating a conservative role for women The public statements of Rajmata Vijayaraje Scindia and Mridula Sen, the president of the Mahila Morcha publicly supporting the derogative practices of sati and dowry are well known Although out of the 2,00,000 kar sevaks who went to Ayodhya 55,000 were women, their role was mainly behind the curtain— cooking and feeding the male counterparts [12] But as large numbers of women enter the public arena under the banner of communal forces slowly but steadily the older and conservative notions about women's role and status in society will give way to a struggle for equality within the organisational structure This can be seen from the recent rebellion among a group of BJP women MPs against the sexist insult of Uma Bharati Newspapers reported rumblings of discontent in the mahila morcha of BJP which is demanding a broader representation within the organisations Even the most conservative Hindu organisation the Rashtriya Swayamsevak Sangh (RSS) imparts physical training with a special accent on the martial arts to its women members, the Rashtra Sevikas [13]

Indicating this shift in the party's attitude to the women's question Mridula Sen, stated in an interview that women leaders are working on a perspective paper on 'BJP and Women' She added that it is important that women know their rights and only by educating them and making them independent entities can women access these rights Further she condemned the Muslim Women's Act as a backward step According to her the BJP has never discouraged women from standing for elections During the 1989 the BJP fielded the highest number of women, i e, 5 5 per cent as compared to the 4 5 per cent of the Congress and 3 3 per cent of the Janata Dal Even the Shiv Sena has been taking a more active interest in women's issues in recent times In a case where a minor domestic worker was repeatedly raped by her employer which resulted in pregnancy, the issue got public attention when a Shiv Sena MLA raised it in the state legislature

With women's concerns gaining prominence the women's organisations will be forced to choose their political allies within the existing political set up For instance the recently constituted women's commissions both at central and state level will be broad forums which includes representations from women's organisations along with other political parties While this will provide the opportunity to influence policy decisions, the representatives will have an option either to be co opted by the ruling party or form broad alliances with the opposition including the communal organisations The question which needs to be addressed is whether in order to strengthen women's interest it would be strategical to join hands with communal forces in broader forums which might amount to a tacit endorsement to their anti Muslim propaganda Or should commitment to secularism and minority rights be a pre condition to forming coalitions for women's rights?

New Challenges

While these issues have not been adequately addressed, the complexities of the post riot situation have brought minority concerns to the centre stage Some groups feel that women's issues could no longer be addressed merely within a patriarchal framework along gender lines but would have to be re-examined within the newer challenges to democracy, secularism and minority rights The questioning is not limited to controversial issues like personal laws but extended even to seemingly non controversial issues like domestic violence

Here is one example of the choices which were thrust upon women's groups in the context of the riots, Around October 1992, the joint commissioner of police R D Tyagi issued directions to the subordinate police stations that cases of domestic violence should not be registered against women who do not bear visible marks of physical injury on their person This direction was a set-back It is through a sustained campaign that a special provision was incorporated within the Indian Penal Code, i e, Section 498(A) which recognised both physical and mental violence against women within the matrimonial home Although the officer later retracted his statement, to counter the allegation that women misuse this provision, a seminar was planned with police and legal authorities and was scheduled for January 1993 But the riots of [illegible] 1992 changed drastically the [illegible] of the seminar In the wake of the [illegible] scale police brutality where groups of [illegible] young boys picketing on the roads were sh[illegible] down by the police, the faith of the minority community in the law enforcing machinery had totally broken down Large numbers of Muslim youth with bullet injuries were hiding in their homes haunted by the fear that they will be locked up if they come into the vicinity of the police stations [14]

In such a situation where one whole community was being held at ransom, the issue of domestic violence had lost its earlier context By organising a seminar on domestic violence we would be helping the police to defuse the more pressing issue of police excesses during the riots Interaction with the law enforcing machinery in a forum on women's issues would amount to condoning their brutality towards Muslims

The police were too eager to arrest Muslim men under any pretext They would have entertained a Muslim women's complaint with undue eagerness and responded to it promptly Viewed within the context of the women's movement, it would have been an ideal situation, but the response would in fact be anti-Muslim rather than pro-women By applauding this move on the part of the police the movement would be segregating the issues affecting the Muslim women into isolated compartments of gender and religious identities During these months of political instability the number of women approaching the agencies for help had decreased The number of Muslim women following up their court cases had gone down even more drastically The violence and instability had corroded the social fiber an essential pre-condition for raising the question of domestic conflict

But ironically the social space which is denied to women in peace times was now being offered to them on a platter in the face of grave adversity Women from both communities were being used or became willing martyrs in aid of the community defying traditional norms and roles In

predominantly Muslim localities women became the buffer between police and the community youth and hence suffered casualties.

The elderly neighbours of 50-year-old Neelam Bano who was shot dead on December 8, 1992 in a slum in Bandra east say, "As the police opened fire, a group of us elderly women came out. We did not let the boys come out as the police might fire at them. We did not think that the police would fire at a group of elderly women."[35] In many 'bustis' while men went into hiding, the women braved the bullets to fend for the children with a great sense of pride and honour. It is the women who stood in long queues to claim relief at the collector's office or went to police stations to lodge complaints.

On the other side, the Shiv Sena was able to mobilise a large section of women to hold traffic blocks and demonstrations outside police station to protest against detention of community youth, even at midnight. Women slept on the roads to prevent army trucks from entering the area to rescue Muslim hostages or put off the blazing fires.[36] The slogans which the left groups had used to strengthen collective actions were now used to whip up communal frenzy among violence mobs. For instance the slogan—'Hum se jo takarayega, Mitti me woh mil jayega' (Those who confront us will be destroyed or in other words might is right) rent the air. But sanction to oppose traditional norms did not imply that they would not be victims of sexual jealousy and domestic violence within the homes. So the women who threw stones at the Muslim men who were set on fire in the middle of the road, would yet have to approach a women's organisation for help in personal problem.

With the Muslim community the equation was in the reverse. The community leaders who were fighting for a legitimacy and a right to dignified existence in a riot-torn situation became our allies in anti-communal forums. But at that moment we could not dare to ask them their views on the Shah Bano judgment or triple talaq. And even while we were being welcomed with open arms during peace rallies we are apprehensive that riot time allies might become peace time adversaries. The same men may deny us access to the women once normalcy is returned if we work on the issue of maintenance to the divorced Muslim woman.

Women leaders of left political parties like Ahilya Rangnekar while confronting the fact that women had played a significant role in the riots admitted that the left parties and women's organisations had failed to counter communalism. It was evident that gender unity could not withstand communal hostility.[37] A section of women most difficult to mobilise, i e, housewives had responded to the call of Hindutva and marched under the banner of Shiv Sena and Durga Vahini, the women's wing of BJP. Sadhvi Ritambara and Uma Bharati addressing mammoth public meetings of devout followers became the living incarnations of shakti.[38]

The riots dealt a severe blow to the premise that the women have a separate existence away from their communal identity where we can discuss problems of rape, divorce and maintenance on a common platform. The same issues affect different women in different ways at different times. We also realised that our allies and adversaries would change depending upon the external realities. If social action means reacting to external social reality, then as the external reality changes the internal positions have to be redefined or else the movement itself would be redundant in the wake of the newer challenges.

In conclusion it is necessary to emphasise that the critique of the movement is made from within, having participated in all the different stages of the development of the movement. The contradictions and confusions are as much a part of the movement as its gains and are signs of a movement which is alive and growing while reformulating its positions in response to external shifts in the configuration of powers.

The women's movement does not stand in isolation and is an integral part of other social movements. Hence the contradictions and ideological shifts expressed here within the context of the women's movement hold true for other social movements as well. During the last decade the trade union movement in Bombay has become communalised with the Shiv Sena dominating many important trade unions in the city. The Sena-dominated unions in Larsen & Toubro, Oberoi Towers, Bombay Dyeing and other private companies not only led the riots but also demanded that Muslims be removed from the workforce.

But the hostility towards the Muslims was not limited to Sena-dominated unions but was also widespread among left party affiliated unions which resulted in many stabbing and burning instances within factory premises. This led to large-scale absenteeism of Muslims. Less than 30 per cent of the Muslim labour force in the organised sector returned to work even after a month of the riots. In an effort to restore normalcy, establishments like Tatas issued a public satement inviting the Muslim workers back to work and promising them adequate protection. But some others sent their Muslim workers on leave on the grounds that they could not guarantee their safety.[39] The severe blow to the commercial activities of the trade centre led industrialists like JRD Tata and Nani Palkhivala to demand a partial emergency or to declare the city as a union territory in order to bring the riots under control.[40] This is an indication of the level to which the trade union movement was divided.

Analysing the developments, one trade unionist felt that the Shiv Sena had been able to provide the space for the cultural assertion of the workers, however narrow and excluding in nature it might be. On the other hand the left organisations had rallied mainly around economic and political issues which perhaps might have been limiting in its scope. The dalit and other caste-based movements also had to confront similar issues... The Mandal issue which had divided the Hindu community along caste lines stood united as a cohesive Hindu force against the Muslims. The progressive organisations which had supported the Mandal campaign found that this alliance could not withstand the stress of communal pulls. Within the government bureaucracy those who were occupying reserved seats expressed deep rooted communal biases even while implementing relief programmes declared by the government. In Dharavi and other bustis the corporators belonging to the Republic Party, a political forum of the dalits led the riots against the Muslims. Shanta Dharia, a Republican Party woman corporator was shot down by the police while leading a rioting mob.

A similar rescrutiny of earlier presumptions and premises of other social movements might help in building up a consolidated secular force which can stand the onslaught of rising communalism and counter its challenges effectively.

An Indian Intellectual's Anguish

A G Noorani

Bewildered India: Identity, Pluralism, Discord by Rasheeduddin Khan, Har-Anand Publications, Rs 350

THIS book expresses not so much the bewilderment as an anguish of an Indian intellectual. Like many in the country, he seems to cry "This is not the India we once knew, still less the India we dreamt of". Rasheeduddin Khan writes "Frankly I am passing through a mood of despondency, despair, anguish and anger, by witnessing the erosion of values in social and political life, the steady deterioration in practically every aspect of collective existence, and our incapacity or unwillingness to resist it.

"Normally given to normative and optimistic writing on the national problems one now realises how unrealistic, irrelevant and ivory towerish some of us of the idealist and ideological mould have been in our otherwise well meaning zeal to portray only a positive picture. Out of the politeness of our style and innate sense of balance often we have avoided calling a spade a spade."

With equal candour one might add for this state of things Indian intellectuals share a significant proportion of the blame. How many of them lionised the leaders of the Sangh parivar. Saw virtues in the RSS, the Jan Sangh and the BJP. Lauded Indira Gandhi's authoritarianism and condoned Rajiv Gandhi's crooked ways. Condoned Morarji Desai's hypocrisy, Chandra Shekhar's frauds, and V P Singh's falsehoods. Condoned violence, ignored the lies and the false values systematically propagated. Those who in the name of the rule of law ignored the plight of millions to whom the rule of law could mean nothing were and are as culpable as the political thug out to undermine the rule of law.

Rasheeduddin Khan's anguish is expressed without rancour, is embellished with Urdu poetry, and is enriched by a marshalling of historical facts which should instil an Indian with pride. Provided of course, that the composite culture of India and Indian nationalism mean something to him.

On this, the caution administered by the man the Sangh parivar hates bears recalling. Very many in the party that professes, hypocritically, to be the bearer of his legacy need to be reminded of it as well. Jawaharlal Nehru told the AICC on May 11, 1958 "The communalism of the majority is far more dangerous than the communalism of the minority." Not that he condoned the latter. But, as he explained later "Communism is a part of our society." He did not accept the view that one community was communal and not the other. However, and this is of *crucial* relevance today "When the minority communities are communal you can see that and understand it. But *the communalism of a majority community is apt to be taken for nationalism*." This is what happened in Russian dominated Soviet Union and Serb dominated Yugoslavia with consequences for all to see. This vital distinction lay at the root of Lee Kuan Yew's query to the Malay leaders of Malaysia "Will it be a Malay Malaysia or a Malaysian Malaysia?" They saw the point and *expelled* Singapore from the Malaysian Federation. For long the expression "nationalist Muslim" was in vogue in arrogant disregard of its insulting implications which Mushirul Hasan so ably pointed out in his introduction to the collection of seminar papers *Islam and Indian Nationalism: Reflections on Maulana Abul Kalam Azad*. The Sangh parivar today is the single biggest threat to the Indian Constitution deserves to be asked which of them is the "nationalist Hindu".

This is not to deny other threats to our polity. Every thinking Indian has his own perceptions of them. Rasheeduddin Khan has rendered high service to India's federal credo. To him India is "an evolving federal nation". Four core areas are covered in this book—Indian identity and pluralism, Muslims, communalism, and secular polity. It is a powerful plea for India's composite culture, its federal polity and its plural society. Each theme is properly linked and placed in perspective. "The Muslim situation and problems should be located and understood in the larger context of the contemporary Indian reality in its implications and ramifications." The India of today has been shaped by all its communities. The author's survey of the Muslim contribution compels admiration, because it places that in its context. He is at pains to demolish stereotypes about Muslims.

Islam first came to India in Malabar. Mohammed Ali Jinnah was not the only ignoramus to characterise the Muslim majority provinces of India as their "homeland". In truth their homeland was India entire. Islam's experience in India was fundamentally different from that in Egypt, Iran, Afghanistan and other places. The rich and resilient Hindu civilisation survived and flourished even under Muslim rulers. A composite culture grew up. Rasheeduddin Khan's recital of the contributors bears quotation *in extenso* for two reasons: the facts are not well known in our clime today and the recital reveals the author's learning and approach.

The trend of composite culture from 13th century onward has had a galaxy of names of enlightened rulers in different parts of India, sufis and theologians, writers, poets and artists. Among the rulers for instance, one can mention Sikandar Lodi of Delhi (1489 1517), Zainul Abidin of Kashmir (1420 1470) Ibrahim Adil Shah (1535 57), and his son Ali Adil Shah (1557 79) of Bijapur, Ibrahim Qutub Shah (1550-81) and his son Quli Qutub Shah (1581 1611) of Golconda, Sher Shah Suri (1539 45) Mughal emperor Akbar (1556 1605). Among theologians and sufis, Baba Farid (1173-1265), Nizamuddin Auliya (1238 1325) Nasiruddin Chiragh Dehli (1296 1356) Shaikh Abdul Quddus Gangohi (1456 1538) and his son Shaikh Ruknuddin (d 1575) Mirza Mazhar Jan-i-Janan (1699 1780). There is a long list of writers and poets whose lives were devoted to the values of composite culture. Some of the eminent are Ziauddin Nakshabi who translated 52 Sanskrit stories in *Tuti Nama* in 1330, Qutban Jaunpuri who wrote the masnawi *Mrigavati* in 1501 in Awadhi, Malik Muhammad Jaisi (1493 1542), whose masnawi *Padmavat* (1540) and *Akhravat* established a new trend in Hindi. Hammad, who compiled the first book in Persian on Indian music called *Lahjat e Sikandari* in Sikandar Lodi's time. Shah Manjhan Jaunpuri whose masnawi *Madhumalati* (1545) was popular in Akbar's time, Shaikh Nabi Naunpuri whose masnawi *Jnan Deep* was written in Jhangir's reign. Shah Miranji's (d 1563) masnawi in bhakti strain, Sultan Ibrahim Adil Shah's pioneering book on Indian music called *Kitab i Nauras* (1600) Mulla Nusrati of Bijapur's masnawi *Manohar and Madhumati* (1657), Ishrati's nasnaw *Dipak Patang* and *Chaat Lagan* in Jaisi's style. Muqimi's masnawi *Chandar Bhan we Mahyar* a romance of a Muslim boy and a Hindu girl (1657) Mulla Wajhi's masnaw *Qutub Mushtari* (1610) in Dakhini Urdu, Ibn Nishati's *Phul Ban* (1656) Ghulam Ali's rendition of Jaisi's *Padmavat* in Dakhini (1680) Miran Hussaini Shah of Hyderabad's *Tuhfatul Ashiqain*. Faizi's (1547 95) translation of *Mahabharata* and *Nal and Damyanti* into Persian. Abdur Rahim Khan-i-Khanan's (1556 1627) poetry especially his *Nayik Bheda* in barve meter. Raskhan's (b 157?) *Sujan Raskhan* and *Prem Vatika*, and Nu Muhammad's masnawi *Indravati* (1744) patterned on Jaisi's *Padmavat*.

They are disruptionists who reject th heritage. It is this rejection of the composite character of India's culture which lies at th root of the crisis of India's secularism. The author lists seven disasters which followe in train "(i) division of the emerging pan Indian political fraternity, (ii) partition of a integral country and its unified civilisation (iii) trifurcation of the subcontinent's Muslim segment (iv) set back to the process of composite culture, (v) destabilisation of Urdu, its heritage and of its votaries (vi) emergence of Muslim fundament

lism in Pakistan, Bangladesh and India; and (vii) the spread of bigoted, belligerent Hindu revivalism in India and among some Hindu NRIs."

The book is not meant to be 'an academic monograph', the author cautions. It is intended to be "a stimulant for greater awareness of the many interlinked problems of a bewildered India". Ours is a country of continental dimensions. It has a distinct, unified civilisational unity and a wealth of diversities. He does *not* regard India as a union of nationalities but as a federal nation—"unity of polity and plurality of society". For all our problems, we need not be pessimistic. In little Belgium, the Flemish and Walloons still squabble over Brussels. Witness Ireland, Canada, the US. Our diversities are greater. Nor is it fair to demand, as some do insistently today, that all Indians should have the same perception of the country's history. The southern American's perception of American history is different from that of his fellow citizen on the East Coast. A New Yorker's perception will be different from that of the Californian. It is the lust for unification, for obliteration of diversities which has blighted modern India.

Besides federalism, the author's other dominant concerns are the place of Muslims in India and the future of secularism. His demolition of myths is graceful and effective: "Probably no other language of India reflects the ethos of composite culture as fully and in all its nuances as Urdu does. And no other language has such a wide repertoire of poems on almost all major occurrences of political life in India in the last three hundred years as Urdu has. Indeed it is one of the greatest repository of poems on aspects of social life, festivities, cultures, natural beauties of India, and the vicissitudes of politics. The span from the decline of the Mughal power covering events and episodes to the rise of the British colonial system, the long-drawn struggle for national liberation in all its phases, and almost five decades of independence are recorded with sensitivity, pathos and patriotic verve. This is partly because of the heritage of acute political consciousness among Urdu poets in every age of its evolution, and partly because Urdu has always had a pan-Indian outlook and national vision."

There are two chapters which are of particular relevance and merit high praise. One is on 'Muslim Perception of India' in which the author gives a fine selection from the works of Muslim poets reflecting their concerns *about India*. The very next one is entitled 'Toward Understanding Hinduism: Reflections of Some Eminent Muslims'. Both testify to the author's erudition and his fine impulses.

Alas, we have fallen on sad days. Violence is endemic in large parts of India. There is an atmosphere of intolerance. The blame is fairly laid:

> The vulnerability of the Indian Muslims to the upsurge of political Hindutva is due in part to the decline in the secular role and political efficacy of the Congress and the Janata Party—the two major platforms of democratic consensus in India, and to a large measure due to the inept, short-sighted and unimaginative political leadership of the Muslim community itself. The fragmented and divided erstwhile Janata Party, which had earlier come to power in 1977, in the wake of loss of popular support by the Congress, could not eventually emerge as an alternative focus of power at the federal level. Splits and dissension had made its several parts—Janata Dal, Lok Dal, Samajwadi Janata Party, etc—a marginal political force, with limited role in checking the drift of the electorate towards the BJP and the Hindutva combine. For years the Congress, due to lack of internal democracy and plagued by factionalism due to its regional, caste and personality-based politics, had lost its will and political power to fight communal and caste-based forces. The sordid inefficiency, incompetence (or, shall we say, connivance) of the Congress government at the centre, in the events leading to, and the occurrences of December 6-8, 1992 in Ayodhya, shocked and bewildered even those who are close and sympathetic to the Congress.

Indian political parties have failed the nation. Unlike, say Sri Lanka, India has failed to develop a viable, functioning democratic party system. Every one of the political parties has compromised with communal parties some time or the other. The CPI was the Jan Sangh's coalition partner in the SVD ministries in late 60s. Political morality is at its lowest today. Exploitation of religion comes naturally to desperate seekers of power.

The author holds that "The process of federal nation-building involves for its fuller realisation the synchronisation and convergence of at least those five major processes on which a considerable consensus exists. These are: (i) mass mobilisation and political participation (based on equality of status and opportunity of the citizenry); (ii) democratisation of politics (involving pluralism, competitiveness and distribution of power between the centre, states and local governments); (iii) secularisation of the polity (based on uniform laws, non-discrimination of citizens as citizens, irrespective of caste, religion, language, race, gender, etc); (iv) rationalisation of administration and bureaucracy (achieved through their unbiased commitment to public responsibilities according to the goals enunciated in the preamble to the Constitution; and (v) national integration (of the discrete segments of the polity)."

The task before us is the reconstruction of the Indian polity as envisioned by the founding fathers. Analyses like these can help immensely.

An Affair to Remember

M S

My Economic Affair by Ashok Desai; Wiley Eastern, 1993; pp xi + 332, Rs 300.

THE title of the book creates an expectation that the author would let the readers have a peep into his involvement in the myriad intricacies of policy-making and provide an account of his brief encounter with the other actors in the inner circle of government. That expectation is not fulfilled except by reading between the lines. What the book does however is to give a lucid and highly readable statement of the author's position on a wide range of economic policy issues. This position, again, is stated in two parts. Part I, which is called 'A View from the Foothills' is written before Desai became chief economic consultant in the ministry of finance and is a review of reforms in the first few months after June 1991. Part II, ponderously described as 'A View from the North Col', are reflections on economic policy in the light of his experience within government. The progress to Mount Everest was, however, abruptly halted after 18 months, when Desai decided to leave the government. The book as such gives only a hint as to the reasons which impelled him to do so. But elsewhere in public pronouncements he has left no doubt that he left because he was dissatisfied with the pace of reforms. The early promise of swift moves on a broad front, which was implicit in the dramatic initiatives taken by the government soon after it came to power in mid-1991, was not fulfilled. Desai's impatience with slow progress must have led to frustration. The policy-maker is subject to many pulls and pressures, not all of them are ideological. Vested interests and political and bureaucratic ambitions predominate in these. It seems the author did not quite succeed in coping with these. His honesty is transparent in what he says in the Introduction:

> But the career of an economic advisor is always precarious. His job is to tell it as it is and advise as he sees right. But the basic instinct of the government is political survival. To tell it as it is would be treason if the facts gave ammunition to the opposition; to advise what the government should but cannot do would point to its impotence. So an economic advisor must not do his job too well. I did not either, but I never quite got the hang of when to do it well and when to mess it up. Finally I decided that the game of snakes and ladders, which those aroun

played with such ferocity, such guile such subtlety, such flair, was not the game for which I had joined the government, and left

Even so, while he was there, Desai seems to have enjoyed every bit of it. The thrill of being 'in it' at a historic time is evident. And if the finance minister missed it under strain Desai was there to remind him. 'These are the days about which you will tell stories to your grandchildren", he told Manmohan Singh. For obvious reasons we are not told any stories. What we have instead is a manifesto of economic reform, Desai's credo in short.

The general approach to economic policy which permeates the various chapters of the book will not be questioned except by those who cannot still give up their faith in the efficacy of a command economy. The regime of controls and licensing has failed. What is being put in its place is still in transition—a painfully long transition which creates new distortions. Hence it is important to keep going without losing momentum. This seems to be the central message of the book. The reason why the momentum seems to have been lost is the continued hold of the bureaucracy. Government's style, he says, is bureaucracy-intensive and has thus a tendency towards complexity. If the government wants more gold it will not simply buy it in the market but would instead issue gold bonds with complicated conditions. The penchant for convolution, however, stems from caution. And what the author calls the corporatist style of managing the economy is inescapable in a democracy. How else can a step-by-step reform process be introduced? If laws have to be amended the process will still appear to be bureaucratic—ministries have to be consulted, parliament has to debate and pass the amendments. All privileges cannot be abolished at the same time and it is through the spoils of reform that a constituency for reform can be built. The impatience displayed by the author may, one might surmise, have influenced the practice of resorting to ordinances to bring about changes in economic legislation in the last two years. Such a practice may be defensible when there is a time constraint, but not on the ground of getting around bureaucratic and legislative complexities. The general point is valid that the attempt should be to move away from discretionary interventions and towards market-determined outcomes, but the move itself cannot always be a simple act of abolishing this and that.

Instead of dealing with the specific prescriptions of the author in the different areas of economic policy, all of which follow the logic of market-orientation, it is instructive to draw attention to a few striking ideas. On the issue of stabilisation policy, there is, for instance, spirited rebuttal of the oft-repeated argument that inflation is a result of cost push and hence a reduction in fiscal deficit will fail to control it. That this view is not consistent with the view held by the same group of people that inflation hurts the poor since the poor are not able to get their wages and incomes adjusted shows up the glaring contradiction in their belief. Again, for those who are so easily convinced that there should be a full scale value added tax, Desai offers a word of caution. He would prefer an excise duty on the basic inputs, along with a conversion of all taxes on business profits into a value added tax. It is unfortunate that such a potent idea as this—and there are many such in the book—is not analysed in detail. In more senses than one, the book is an appetiser—the full menu one hopes will follow.

On the financial sector, Desai would propose a two tier system—small banks affiliated to bigger ones. Do not eliminate the village moneylenders, he says, since his costs are lower, he has better knowledge of the credit risk and he delivers. Instead bring him under the discipline of the market. Emergence of small banks would do this. On capital market reform in general the author favours prudential regulation. The attempted over regulation of the capital markets by SEBI comes under heavy fire.

There are chapters on industry, infrastructure, R and D (which is a subject on which the author has done considerable work in the past), labour and even agriculture. In all these the theme is the same—use the market. But each case is dealt with pragmatically and with creditably a heavy dose of common sense. The most difficult problem is in respect of the so called exit policy. The author's remedy is an insurance scheme along with a voluntary agreement among workers and employers not to avail of their rights under the Industrial Disputes Act. Here again, a more detailed analysis and elaboration would have been of help.

The canvas of the book goes beyond economic reforms *per se*. In line with the current fashion of putting good governance at the centre of pre conditions of development, the author has provided a chapter on how to redesign government. There are some innovative ideas here such as that there is no need for a special electoral machinery but instead the post offices would keep the relevant electoral records. "The election commissioner, of course, should not be abolished" says the author. "He is a gem." The author believes that the basic unit of government should be much smaller than the present states. Although he does not say so he seems to favour the strengthening of the panchayat system and a direct relationship between the centre and local bodies. He does not seem to have appreciated that there might be perverse political reasons for promoting such a reform and might have unwittingly provided the rationale for it. The notion that states need not be based on "synthetic nationalism" sounds nice, but how practicable is it to think in terms of popular votes in favour of mergers with neighbouring states? Federal financial arrangements, he says, should be pre-ordained and there is thus no need for periodic Finance Commissions. He has some suggestions as to how the Planning Commission could play a more useful role but in its present form he would regard it as an encumbrance. It is just as well that the author has not shown a preference for one institution rather than another and would rather junk both! There is no need to comment on such a sweeping judgment. That the functions of the two commissions overlap is well known and has been noted by successive Finance Commissions. That the Planning Commission may need to redefine its role in the context of the new economic policy is also obvious. But in a federal system, there is need for some institutional machinery which smoothens the relationship between the centre and the states. This aspect of the matter has not received enough attention of the author.

All said and done the book is a refreshing one, indeed provocative in many places, and contains many new ideas which however need to be worked out in greater detail. It must be prescribed as compulsory reading for anyone seeking a degree in economics and would provide an excellent agenda for initiating debates on the various policies which are discussed by the author. It is obviously a hurriedly put together book. There are a few typographical errors, at times references are not fully cited and at least one table is missing. But some of these pitfalls would, no doubt, be corrected in the second edition which the book fully deserves. One also hopes that next time around it will be a fuller menu complete with sauce and salad.

Identity, Communal Consciousness and Politics

Ghanshyam Shah

To what extent do different cross-sections of society subscribe to the communal ideologies which provide legitimacy to communal riots? To answer this question we need to explore people's perceptions on communal divisions and related issues. An attempt is made in this paper to examine individual identity and communal consciousness and their manifestation in the political arena through a survey of people from different parts of Surat city which witnessed communal riots in December 1992 soon after the demolition of Babri masjid.

INQUIRIES into the nature and intensity of communal riots in Surat and elsewhere reveal that though *agents provocateurs* and participants in acts of violence were few, a large number of onlookers occasionally joined the crowd and extended subtle support to the rioters. On the eve as well as during the riots in the city, the atmosphere was surcharged with emotions reinforcing communal categories and idioms. To what extent do the cross-sections of a society share the communal ideology which provides legitimacy to such riots? In order to understand this, we need to explore perceptions and opinions of the people on the subject of communal division and related issues. As a preliminary exercise to understand the complexities of 'mind-sets' of people, let us examine the nature of individual identity and communal consciousness and also how they get manifested in the political arena. The present study is confined to Surat city which witnessed communal riots in December 1992, soon after demolition of Babri masjid. The study is based on survey research, interviewing 723 persons in May-June 1993, from various parts of the city.*

I
Identity

Individual identity is not just one's relationship with others. It is not merely an ascriptive or achieved membership of this or that collectivity. It is essentially a matter of being and it is this consciousness of belonging to this or that collectivity and of being a member of an imagined community that determines the form of this identity. Such being or belonging is codified and invented by one's own self or assigned by others. The course of 'invention' and 'imbibition' is complex and contextual. Take a simple example of one identifying as a kshatriya. One may inherit this identity from a family or a social collectivity in which one socialises. It is an ascriptive identity. And/or one begins to identify as a kshatriya in spite of the 'jati' being different in order to gain status and security as well as expand one's social sphere or for widening one's relationship for creating and reinforcing the support base in public life. Such an identity may also be assigned to an individual by census, historians, social scientists and social or political leaders and over time may be imbibed by a community and hence its members. The notion of identity is contextual and keeps changing with time and space. In the complex modern world one simultaneously has more than one set identity. For instance, an individual may be a nagar brahmin ('jati'), brahmin ('varna'), vaishnava, Hindu, Surati, Gujarati, Indian, businessman, Congressman, social activist and so on at the same time. While being conscious of all these identities one expresses them varyingly in varying contexts. Nonetheless, certain identities within a given socio-political milieu have precedence over other identities.

Identity formation which is often, but not always, a cultural construct, is a process of 'inclusion and exclusion' of values and symbols defining 'we' and 'they' or 'us' and 'others'. In the process boundaries between the two take shape whose forms keep changing from time to time. Relationships between 'we' and 'they' are not necessarily always conflicting or competitive. Acknowledgements of commonality and overlappings between the two in various social spheres often blur the boundaries. On the other hand, when a cultural identity takes a political form, differentiations between 'we' and 'they' get sharper and hardened. Conflict and competition between the two—particularly for those who give political meaning to identity and/or vie for the control of resources—become sharp and tend to gather a specific shape. In the process, meaning of 'we' and 'they' also change that of the cultural construct. Prejudices become pronounced and boundaries for interactions get redrawn wherein commonality is ignored or underplayed and differentiations are stretched or reinvoked.

It is an agenda for the Hindu and Muslim fundamentalists alike to ignore occupational and internal socio-cultural differentiations within the religious communities. Their aim is to shape and carve out unified monolithic Hindu or Muslim identity of an individual. Towards such an end, symbols are evolved, legends are invented and history is reinterpreted. Besides ideological reconstructions, several programmes are launched in order to develop communal identity and consciousness of the two religious groups. Hatred against each other is invoked and exhorted. People however do not necessarily get carried away by such propaganda always. Often selective, they get persuaded by exhortations suiting their material or psychological needs. Along with other intra-group social or individual rivalries, such campaigns nevertheless pave the way to communal violence. Riots in return reinforce the communal identity. An individual who has internalised communal consciousness may or may not participate directly in riots but tends to legitimise violence. Therefore, understanding the nature of communal identity and its associated consciousness becomes imperative for comprehending communal phenomena.

In order to ascertain as to what was uppermost in respondents' minds about their identity, we asked open-ended questions: "Different people introduce themselves differently. Given the fact that some introduce themselves by their occupations such as businessman, worker, teacher, etc. Some by region such as Gujarati, Tamilian, Bihari and the like, some by 'jati' and some by their 'dharma', how would you introduce yourself to a stranger asking for your introduction?". The question was somewhat repeated to know the second identity. Of course, one's introduction to a stranger does not necessarily capture complexities of identity. This is only one tentative clue to unfolding one's identity. A caveat needs to be entered about the context that people were interviewed in May-June 1993, soon after the second phase of riots. And respondents were told that our study was regarding the recent communal disturbances in the city.

The responses are reported in Table 1. It is a cross-table giving first and second identity. Since 9 per cent of the respondents did not answer the first question, the second question was not applicable to them. One-fifth of the respondents did not give their second identity. For them there was no difference between their first and second identity.

One-fifth of the population identified themselves as belonging to specific religious groups. All of them however did not introduce themselves as Hindus or Muslims. A few expressed their identity by sect. "I am none but a Swaminarayani and all those who follow the Swaminarayan sect are my brothers and sisters", a businessman dealing in diamond trade told us. He had a 'tilak' placed on his forehead which is a distinct mark of the sect. Similar instances were also found among the Muslims. For example, a Sunni Vohra businessman preferred to be called a Sunni Vohra rather than a Muslim. One fourth of those giving religion as their first identity also repeated it to be their second identity. In this case they gave the name of their sect. That is, the first identity as Hindu and the second as Vaishnava or vice versa.

A majority who placed religious identity over other identities are workers in white collar jobs and students. Religious identity was expressed in larger proportion by the minority groups. Their number is larger among the Jains, Christians and Buddhists than the Muslims. Among the adivasis expressing religious identity was preferred only by a handful of persons. The highest proportion of those who preferred to be introduced by their religions is found in middle and upper caste groups.

Self identity expressed through caste is pronounced among a sizeable section of both Hindus as well as Muslims. Those giving caste as their first identity constitute the single largest group. Even in terms of expressions related to the second identity caste remains predominant. Many reiterated their caste status and identification by placing themselves within specific sub castes as the second identity. In other words, while the first time one identifying himself as a kshatriya called himself Koli at the second level of identity. Thus it appears that for the majority the caste identity is either the first which precedes religious or regional identity, or the second next to regional identity. While many who preferred to express caste as their first identity are distributed broadly in similar proportion across all occupational groups, they are however slightly more among casual labourers. A large number of them belong to the OBCs and only a small proportion belong to the SCs. In Surat OBCs have emerged as a political force only recently and are an upwardly mobile group.

One-fifth of the respondents expressed their first identity by the place of their origin either by region or city. Significantly, a majority of those inclined to be introduced in this manner are local Suratis. Twenty three per cent of the Suratis as against 17 per cent of the immigrants preferred to place their regional identity over identities like caste or religion. However, for many of them the second identity was expressed through their religion. Thus, to them, regional and religious identity go together, as it is the case of caste and religion.

Only a few (9 per cent) liked to be identified by their names that I am so and so. Many among them also repeated that as the second introduction. A majority among this group are white and blue collar workers and belong to OBCs, SCs and STs. Seven per cent of the respondents preferred to be introduced as Indians first and a majority among them chose to express their second identity through religion or caste. This does not seem surprising in a situation where religion and nation are seen as co-terminus with one another. Only a few expressed their first identity through their occupation. They are mainly factory owners, businessmen and white collar employees belonging generally to upper and artisan caste groups.

The nature of economic growth in India in general and Surat in particular with a significant portion of its labour force placed in its informal sector has had little impact in the formation of the secular identity. Electoral politics has helped in reinforcing primordial identities. In such a milieu it is not surprising for an overwhelming section of the population to pronounce caste as their first identity irrespective of their sex, age, educational status and occupation. The campaign of the Sangh parivar and Islamic fundamentalists has not succeeded even in weakening caste and/or sectarian differences. It is however noteworthy that a relatively large section among the artisan caste groups, SCs and STs have preferred to introduce themselves first by their names, occupations or as Indian rather than by castes. This is because a secular identity becomes more advantageous

9 We should not rent or sell a house to members of the other community in our locality/housing complex	16	19	6	53	6

to them than their traditional caste identity which puts them at the lower rungs on the caste ladder The question then arises as to how does an individual identity get reflected in communal consciousness?

II
Communal Consciousness

'Quam' (in Gujarati it is pronounced as 'kom') or 'jat', that is commune or community, is more often than not understood and referred to in day-to-day parlance as caste or cluster of castes in India While referring in this manner, one imagines having an immediate or a distant social relationship, sharing common heritage and 'sanskar' (culture) and fraternity with members of the 'quam Such notion of 'quam' is not only prevalent among the caste-Hindus, but also among various Muslim social groups We have already seen that in the midst of religion-based communal polarisations, many caste Hindus and Muslims prefer to identify their 'quam' as 'jati' or 'jamat' Even while the Muslims as a minority are forced to join hands as Muslims on religious ground for their security and survival, a number of them (28 per cent) continue to identify themselves as maleks, memons vohras, khojas, more salams Garesiyas and so on

This does not mean that religious quam' as Hindus or Muslims do not exist at their collective consciousness The above data show that after caste, most of their identified with the religious 'quam' This is because of a variety of reasons It is partly because of their real or imaginary historical heritage, linked with other social groups within the larger caste structure in the Hindu framework Certain commonality among members of the 'same' religion through sharing of festivals, chanting name/s of the same god/s, performance of certain rituals, considering certain texts and scriptures as holy, etc, contribute to developing a common religious identity State religious leaders and intellectuals codify people as Hindus or Muslims for at least the last two centuries and see them as 'juxtaposed' in relation to one another Significantly, social and religious reformers and political leaders who mobilised various 'jatis' and 'jamats' at various regional levels amongst Hindus as well as Muslims since the mid-19th century also helped in strengthening such boundaries

Both meanings of the term 'quam', 'jati' or 'jamat' and Hindu or Muslim seem to exist almost simultaneously at a cognitive level Within a milieu of communal riots, both the meanings interfuse and overlap when one speaks to respondents on issues related to 'quam' without specifying any religious community It hence becomes difficult to conclude as to what exactly by the term 'quam' encompasses

Consciousness of one's 'quam' or the communal consciousness in this context is not just a question of belonging to his/her community, but also the intensity of one's identification with it In a 'communalised' situation, intensity of communal consciousness is related with one's perception about 'others' who are considered rivals We have examined five dimensions of this complex state of mind They are (i) identification with one's 'quam', (ii) commonality of interests of the members of the 'quam' and hence the need of their protection, (iii) perceptions about 'others', (iv) economic relations with others, and (v) political power for the 'quam'

One gets socialised in 'jati' dharma from childhood Even those traditionally considered as 'shudras' or 'ati-shudras' and treated as subordinate by those above are taught to perform the dharma sincerely so as to improve their positions in the next birth Those unhappy with their ascribed position invent legends and sanskritise their rituals and life style to establish new status Traditionally ascribed positions, as acknowledged in society, are often disowned and the aspired position becomes real All caste associations in their meetings, conferences, festivals and journals repeatedly ask their caste members to be proud of their quam/jati' and to get united and organised to preserve and advance their interests and 'asmita', i e, identity and dignity Leaders of religious organisations too do the same thing They inculcate communal consciousness through various means Symbols and legends are invented and history fabricated not only to glorify the past, but also to raise hopes for a better future This has been the mission of the RSS since the 20s Hindu religious leaders have given themselves the responsibility of 'reviving and rejuvenating' Hinduism and Hindu political leaders have created various symbols, festivals and idioms to foster unity among Hindus They harp upon the greatness of their religion and the contributions that it has made towards world civilisation This mission of developing a Hindu consciousness has continued The BJP and the Sangh parivar have been greatly successful in this task in recent years Like elsewhere in the country, they also launched massive campaigns in Surat dur-

ing 1989-90 with the aim of making Hindus conscious of their Hindu identity and to be proud of being Hindu. "Why should they feel shy of or inhibited from calling themselves Hindus?", the leaders asked. '*Garva se kaho hum Hindu hai*' ('say with pride that we are Hindus') was popularised by shouting of slogans, writing on walls, pasting posters and stickers in every nook and corner of the city. It was an aggressive campaign during the 1990 and 1991 assembly as well as parliamentary elections by the Vishwa Hindu Parishad. A small section of Hindu secularists attempted to counter Hindu pride through stickers that said, '*garva se kaho hum insan hai*'. It was however confined to a small segment of various sections of the society. Hindu communalists retorted by saying that "yes we are 'insan', but we are also Hindus and what is wrong with being a Hindu?" There were no efforts at discussing the implications of such positions. Those who started this campaign simultaneously also talked about superiority of their religion over others. They kept emphasising their pride as members of their community and projecting their religion to be greater than others in all matters. They talked about strengths of Hinduism, and its 'glorious' past and stated that, "Hindus and Hindustan will rule over the world and the future belongs only to us" in their pamphlets and columns in newspapers. The question thus arises as to how far the people have imbibed this ideology?

An overwhelming number of persons irrespective of occupation, sex, income or political affiliation expressed that "I am proud of my 'quam'". Since we did not specify the term 'quam' as a religious community or a caste, it is difficult to say to which 'quam' they referred. For some the 'quam' meant caste and for others their religious identity. However, all those who clearly professed being proud of their 'quam' do not subscribe to the Sangh parivar's or the non-Hindu fundamentalists' ideology of superiority of their 'quam' over others. Thirty-one per cent refused to take such a position and said that each community has good as well as bad aspects.

While trying to ascertain the extent of agreement with statements regarding common interests of the 'quam' and need for unity to protect such interests, except for a small minority (3 per cent), all subscribed to the view of having common socio-economic interests among all the members of a 'quam'. It is true that the idea of 'quam' and its interests are not understood similarly by all. While the respondents were not asked to clarify their concept of 'quam', some explained as to what they understood by the term. For a majority, it was a caste-based community. But at the same time a few also identified its meaning with a religious community. A similar pattern emerged while examining the aspect of common interests of a 'quam'.

All castes and religious organisations propagate that their members have common interests and that they should work together for the protection of their interests. During the last assembly and parliament elections, the VHP, many of the sadhus and saints, and several front organisations of the BJP issued statements and distributed posters asking people to vote for the party which would protect the interests of Hindus. A question arises as to whether all members of a 'quam' have common social, economic and political interests. Here the understanding of common interests varies from individual to individual and no neat answer emerges. At a normative level, they wish to have as well as perceive common interests of the members. They believe in belonging to the same social group and thereby inherit a common culture—the culture of caste or the culture of religion. Political interests for them are either political dominance or protection. While economic interests mean economic upliftment of all members in the 'quam'. This means job opportunities, business prospects, better living conditions, etc. They do not consider, at least while thinking in terms of common interests of the 'quam', that the factory owners and the labourers or the landlords and the tenants belonging to the same 'quam' have conflicting interests.

To a question as to what they consider as common interests of the members of the 'quam', a postgraduate student wrote, "I am proud to be a Hindu because 'Bharatiya sanskriti' (culture) is very old and the Hindu religion is considered to be 'mahan' (great) in the entire world. *Geeta*, our religious book, provides inspiration to us, to the country, to human society, to all individuals, and to the whole world. I greatly adore and respect the *Geeta*. Bharat is a Hindu nation and it is Hindustan. We should work in the direction of improving the social and economic condition of our Hindu brethren and for that we should get ourselves organised and united so that others cannot harm our interests."

Another respondent who also understood the term 'quam' in terms of a Hindu identity, while elaborating what he meant by common interests, extended repetitive and fuzzy answers. He said that, "dominance of the other 'quam' should not be upon us"; and that "our interests may be endangered by the other 'quam'" or that we are one and therefore our interests are the same.

A Muslim said that the "socio-economic and political interests of people in my community are equal and none in our community should be higher or lower. They all should work for the protection of the interests of all. But in reality this is not seen to be practised."

Another Hindu belonging to a Scheduled Caste group said that "according to the Constitution of India, interests of the members of our 'quam' are not opposite to each other. They are equal. However, there is inequality as far as economic interests are concerned and that ought not to be so. Therefore I believe that we all should work together for the protection of our interests." A member of a Scheduled Caste, who read 'quam' as caste said that his 'quam' was socially, economically and politically backward than the others and they should try to get equality with others. Another respondent from OBC said that, "in my village, members of certain castes own lands and are educated and powerful whereas members of our 'quam' are poor and illiterate".

The communality of economic, cultural and political interests of the members of a

4 Providing financial support	21	42	30	4
5 Had gone on pilgrimage	48	28	20	2

'quam' as perceived by the respondents in this context seemingly indicates two things Firstly, most of them are vague and talk about 'common interests' without specifying as to what they mean by it They very nearly repeat what politicians say in public meetings—more of rhetoric than facts It is *vox et practerea nihil* Secondly, many visualise and consider 'common interests' only at a normative level for which they feel that members of their 'quam' should work together Thirdly, those who interpret 'quam' as caste, perceive their 'quam' as 'social class' having social ties, uniform life style as well as similar economic status among its members

In order to protect the interests of a 'quam', caste leaders and religious organisations often refer to the need of capturing political power For instance, the Rana Samaj or the Koli Mandal of Surat repeatedly appealed to their caste members to vote for a Rana or Koli candidate in different elections for the protection of their interests Similarly, tribals, Dalits, Patidars and others who are numerically large urge upon their caste members the need to acquire political power in order to improve their condition Religious communalists too follow the same logic The BJP and the Sangh parivar repeatedly propagate that the Congress has always pampered minority communities and thereby neglected the interests of the majority and the Hindus have to, therefore, get united and capture power by defeating the Congress—the protector of the Muslims In the absence of this, they emphasise that the day is not too far when they will have to appear as a minority During the 1991 assembly elections, several Sadhus and Saints appealed to Hindus to vote for that party or candidate claiming "to protect the interests of Hindus"

Those believing in commonality of interests among members of a 'quam', do not, however, necessarily subscribe to a view that there is a need to capture political power As much as 18 per cent of the respondents did not agree with the view that it was necessary to obtain political power for protecting their interests On the other hand, more than three-fourths did express a need to have political power for the interests of the 'quam' However, we do not know as to what they actually meant by 'capturing power' and wonder whether it meant voting in elections for a member of their 'quam' or forming a political party or it was a pure and simple empty expression

Communalists often invoke among members of their 'quam' feelings against other 'quam'. Tribals against non-tribals, kshatriyas against patidars, upper castes against backward castes and so on Hindus are told that they face various problems for which Muslims are responsible To a set of two questions aimed at ascertaining the views of respondents about the extent to which they thought their interests (we specified in the question as Hindus or Muslims) conflicted with the interests of the other 'quam' while some did not reply there were others who felt that it was difficult for them to say anything categorically However, 50 per cent of the respondents, expressed a view that the interests of the two quam were antagonistic Some among them shifted their position by not blaming the other 'quam' for their problems with 42 per cent holding the other 'quam' (Muslim/Hindu) responsible for the problems being faced by their 'quam'

During the riots, the Sangh parivar and the BJP as well as some other local organisations and individuals appealed to people through public meetings, street-corner gatherings and by distributing leaflets to boycott goods manufactured or sold by the Muslims Hindus were asked to boycott Muslim autorickshawalas In one case, a professor apparently looking like a Hindu woman stopped an autorickshaw for going to the railway station The driver asked 'Madam! I am a Muslim would you mind hiring my rickshaw?" The professor who did not subscribe to communal segregation was emotionally moved by the question A few reported cases suggest that Muslims were asked or forced to vacate their houses located in predominantly Hindu localities Even before riots, other things being equal, there has been a general tendency to prefer neighbours of similar social background Living clusters of Jains, Vanias, Marwadis, Punjabis, low castes, etc, within the same colony is a testimony to this Nonetheless except among a few having aversion to non vegetarian food habits, tendency of segregation on the basis of caste and community in newly constructed apartments and colonies did not seem to exist This situation has however changed for the Muslims, particularly after the riots Communalists from both groups now talk openly that the 'others' should not be allowed to acquire a house in their localities Let us attempt to ascertain to what extent the people of Surat subscribe to such views

A majority of the people (nearly 60 per cent) do not support the idea of economic boycott Though soon after the first phase of riots Hindus avoided Muslim shop-keepers or vendors an act determined partly by emotional anti Muslim feelings as well as rumours about poison being mixed in food and the like it did not continue for long. Even those believing in boycott, did not necessarily put that into practice owing to the intricate economic relationships Similarly, a majority (69 per cent) did not support the idea of segregating houses on communal lines

To get a clearer picture about the overall communal consciousness an index based on the nine variables was prepared The 92 cases not responding to any of the questions have been dropped from the index Each of the items has a four point scale Anyone strongly agreeing to all the propositions is given 36 points, and the one strongly disagreeing is given 9 points Based on such scores, respondents have been divided into three categories Those getting 22 or less points have been considered to have a lower degree of communal consciousness as against those getting 29 or more points and treated as highly communally conscious persons Even while this is an arbitrary decision, according to the score, 51 per cent have moderate communal consciousness and 26 per cent high communal consciousness

Intensity of communal consciousness was found to be more or less uniform among males as well as females The pattern is also the same among all age groups There is however some variation when we examine their education 25 per cent of the illiterates as against 32 per cent of college educated persons we found to have a high degree of communal consciousness (Table 3)

Intense communal consciousness was found more or less in the same proportion among various religious groups though it was found to be more pronounced among the Christians Jains and Buddhists compared to the Muslims and the Hindus They are 37 29 and 26 per cent respectively Among Hindus the proportion is higher among the dalits adivasis and other backward castes compared to the upper and middle castes (Table 3) Among the dalits and adivasis the phenomenon seems perplexing, for as seen earlier the tendency among them to opt for secular individual identity is generally high The data suggest that collectivity, be it through religion or caste, is felt by them as necessary for their mobility or protection of interests It seems to be a dilemma for many dalits or adivasis for at one level they tend to shun their caste identity but at the same time need to inculcate communal consciousness while aspiring for political power and economic benefits

Seemingly communal consciousness is widespread in different degrees among all occupational groups Twenty four per cent of the factory owners or big businessmen as well as petty shop keepers and 27 per cent of white-collar as well as blue collar factory workers have intense communal consciousness The case of self employed professionals like doctors and lawyers suggests a different pattern with 43 per cent among them falling in the category of intensely communal individual However their number in the sample being too small it might be hasty to draw conclusions

The trend is more or less similar among the economically well off and contented and those having difficulty even in making both ends meet (Table 4) Proportion of intensely communal persons is slightly higher (33 per cent) among those who are worse off than those who are contented (27 per cent)

The highest proportion of intensely communal persons were found among those who preferred to identify themselves by regions But as mentioned earlier regional and religious identities are not mutually exclusive For a majority who gave regional identity as their initial introduction, stated religion to be their second identity Thus, if we take the first and second identities together the pattern emerges as expected Table 5 shows that intensely communal persons are strikingly low among those who preferred to identify themselves by their name or as being Indian And it is significantly lower among those who identify themselves in terms of their occupation

III

Religiosity and Communal Consciousness

Some scholars consider that religion breeds communal consciousness For them religion and secularism cannot exist together For some others communalism is a political construct and is not related to an individual s faith in a religion In order to probe into these propositions five questions were asked about participation in various religious activities Table 6 shows that one third of the respondents visit religious places regularly Most of them did not however participate in other religious activities like attending katha or discourses regularly A majority did not read the sacred books and only 2 per cent had gone regularly on pilgrimage i e jatra' or 'haj' A low proportion of only 4 per cent regularly donated for various religious activities

In order to get an overall picture of their participation in religious activities an index of five activities was prepared Those receiving 16 or more points have been considered to be relatively more active in religious activities (They may be called persons having high religiosity) Only 11 per cent of the respondents have shown such high level of religiosity and 40 per cent have low level of participation in various religious activities Table 7 shows that it is hazardous to say that religiosity and communal consciousness go together That is religious persons are not necessarily communal and vice versa Proportionately smaller number of persons (19 per cent) having low communal consciousness are found among those who are active in religious activities Nevertheless, it seems that if other things are constant religiously active persons tend to become communal This may be because meaning of religion has undergone change in which identity of being we' against they' is getting sharper and composite folk religion is getting weaker Moreover, religious platforms have been used in invoking communal politics during the recent times

IV

Politics and Communal Consciousness

Political leaders and social scientists often assert that communalism is a political issue It may mean two things One, political leaders appropriate communal issues in order to obtain larger support in mobilising people of one or the other community in electoral politics and second, that intensely communal persons are also politically active We shall examine the second aspect of the problem, i e, relationship between communal consciousness and political participation

Three indicators have been used to measure political participation, viz, (i) interest

Table 11 Socio Demographic Characteristics of Those Who Gave First Priority to Construction of Ram Mandir/Masjid

in politics; (ii) participation in meetings/processions; and (iii) working for a party in election campaigns. Though one-fourth of the respondents reported taking interest in politics, only 4 per cent had a great deal of interest in such matters. All those interested in politics do not necessarily participate in various political activities. Twelve per cent of the respondents participated in public meetings and/or processions, and a smaller number worked for any party in election campaigns. Taking these activities together, only 11 per cent may be identified as politically active. Table 8 shows that there is no relationship between political participation and communal consciousness. A vast majority of politically active persons do not have intense communal consciousness and vice versa. What is striking however is that the proportion of intensely communal persons is more among those who are politically inactive. The question naturally arises here what can one infer from the above evidence: is there *depoliticisation* in electoral politics of the intensely *communal* individuals? Or would it mean that political participation in electoral politics tends to soften communal consciousness? These important questions with wider theoretical relevance need further examination.

It is now widely accepted that there is hardly any difference between the Congress and the BJP as far as communal politics is concerned. The Congress distributes party tickets in elections and positions on caste and community lines, shares platforms with religious and caste leaders who speak in a communal idiom. Their support is often sought to mobilise voters. The Congress has not made any effort to develop secular politics in the country, except for chanting populist slogans of secularism or Hindu-Muslim unity. As mentioned earlier, several Congress leaders hold similar views about the Muslims, believe in the dominance of the majority community and 'over-protection' to minorities. BJP politics in this matter is open. In such a situation how far are BJP and Congress supporters different in their communal consciousness? In order to identify Congress and BJP supporters a question was asked "whom would you vote for in the next elections?" 50 per cent respondents reported that they would vote for the BJP. An overwhelming number (88 per cent) of them were committed voters who voted for the same party in the 1991 election too. Thus, the BJP has gained 10 per cent more supporters. The Congress has more or less retained 26 per cent supporters which was the case during the last election.

Table 9 shows that both the Congress and the BJP have almost equal proportion of supporters who have intense communal consciousness and their size is not insignificant. Together they add up to 30 per cent of the respondents. The number of such persons is significantly low among the supporters of Janata Dal, the Communist Party and other parties. Even among the undecided or non-voter individuals, proportion of intensely communal conscious persons is significantly lower than among the BJP and the Congress supporters. Does it suggest that they find no difference between the Congress and the BJP on communal issue or they are fed up of these parties?

V

Construction of Mandir and Communal Consciousness

Another political dimension of *communalisation* is reflected in people's views on the construction of the Ram mandir or Babri masjid at Ayodhya. Communal riots in Surat are closely related with the BJP and Sangh parivar campaign for construction of the Ram mandir. The campaign had been built up brick by brick for the last five years. And the riots followed soon after the demolition of the Babri masjid. Though in its campaign the BJP raised other economic and political issues, it essentially banked upon the issue of temple construction. This intensified communal division in society. We tried to assertain as to how a common person viewed the priority of the temple.

In order to probe into this question, respondents were asked to prioritise five problems according to the importance that they gave to each of them. The problems were: (1) construction of the Ram mandir/mosque at Ayodhya; (2) price rise; (3) unemployment; (4) corruption in public life; and (5) the rising population.

About 5 per cent of the respondents did not reply to this question. Some responded that they did not understand as to what was more important and there were others for whom the day-to-day problems were more pressing than bothering about questions which fall in the domain of political leaders.

Among those prioritising the five issues (Table 10), only a small proportion of 13 per cent considered construction of the Ram mandir or mosque at Ayodhya as the most important issue to be solved, whereas as high as 68 per cent gave it the last priority. Many among those giving first priority to the construction of the temple did so because it was a question of faith and dignity for them. One of them said, "I know that the BJP is not going to solve the problems of our community and is in no way different from the Congress. It aspires for power. But who is really bothered about solving problems? ... at least the BJP would unfurl the saffron flag on the Lal Killa. This is more important." Another respondent said that the Babri masjid was a symbol of slavery and a beginning of Muslim rule. Babar built the mosque by destroying the temple. Construction of the Ram mandir would be a new era for Hindutva and it would bring prosperity. Therefore we should not talk about poverty or unemployment. Once the temple is constructed, other problems would be solved. The Muslims giving priority to the construction of the mosque felt that by the demolition of the Babri masjid, "we were badly insulted. This was a direct assault on our very existence, and on our dignity." Another Muslim respondent said that the reconstruction of the mosque on the same site was necessary for secularism and that the minority community was protected by the Indian state. However, a handful of respondents gave priority to the construction of the temple just to end the communal problem once and for all. A medical doctor said that once the temple was constructed the series of communal riots of the last few years would come to an end and the country would be able to concentrate more on the other pressing issues.

Supporters of the construction of the temple/mosque over other priorities are found in small proportion among both males and females; various age groups and also among educated and illiterate (Table 11). They belong to all varieties of occupational and social groups. Contrary to general belief, their number however is small among white-collar workers and upper caste individuals. It is also significant to note that none among the respondents from Scheduled Tribes gave priority to the construction of the temple.

Appendix: Correlation and Coefficient Matrix of Items Regarding Communal Consciousness

	1	2	3	4	5	6	7	8	9
1 Pride to be	–	.6173	6646	3791	2045	3720	1247	1766	1599
2 Communality of interests	.6173	–	5730	.3623	2735	2650	2285	.2077	.2307
3 Unity of organisation	.6646	.5730	–	3813	.2307	3696	2010	2050	.2017
4 Political power	.3791	.3623	.3813	-	3178	1728	.2778	.1381	1442
5 Antagonistic interests	.2045	.2735	.2307	.3178	–	.0105	4345	2386	2348
6 One's superiority	.3720	.2650	.3696	.1728	.0105	–	.0363	.1270	.1883
7 Others responsible for plight	.1247	.2285	.2010	2778	4345	0363	–	4658	4216
8 Boycott	.1766	.2077	.2054	.1381	.2386	1270	4658	-	6892
9 Segregation	.1599	.2307	.2017	1442	.2348	.1883	4216	6892	–

As is apparent from Table 12 those who give first priority to construction of temple/mosque are in equal proportion among those who have moderate or high communal consciousness, but are expectedly in smaller proportion among those who have low communal consciousness Similar pattern is found among people with different rates of participation in religious activities They are fewer among those who rarely participate in religious activities than the ones who participate in such events more actively

Construction of the mandir or masjid has become a political issue However a large proportion (23 per cent) of politically active individuals gave priority to the construction of temple/mosque This means that for them the Ram mandir is a political issue This is further substantiated by the fact that despite equal proportion of highly communal persons in both the parties a larger number of BJP than Congress supporters gave priority to the construction of the temple This is not surprising for the BJP has made it a political issue

VI

Overview

Caste identity is uppermost in the minds of most people even in urban area like Surat It is more so among the OBCs than the dalits and the members of the upper castes The OBCs in Surat have recently improved their condition and are upwardly mobile through caste idioms, organisation and solidarity in economic and political spheres There is a tendency among the dalits to underplay their caste identity and opt for secular identity through occupation This is more common among those who have higher education and are engaged in white collar jobs or as entrepreneurs for they feel that they have very little to be proud of their caste It is important to note that despite call and programmes for a Hindu or a Muslim unity sectarian and caste identities continue to dominate Caste and religious identity however is not opposite or contradictory at a personal level For many, religious identity is but a continuation of the caste identity Both co exist though their emphasis changes with varying contexts

Individual identity based on caste and religion, reinforces communal consciousness—the consciousness of being member of one's 'quam The connotation of the term includes both caste and religious community But for many a notion of caste based community is closer and more identifiable than religious community It is a social class' whose members not only share an identity a particular life style and a definite value system but also have more or less similar socio economic position as rich business community service class labourers poor backward etc While doing so economic differentiations within a caste, if they exist, are noticed but do not seen as antagonistic But it is not so in the case of religion based community consciousness Economic and cultural differences between caste Hindus are so sharp and antagonistic that community of interests' as Hindus or Muslims is vague and rhetorical

Caste or religious communal consciousness is widespread in Surat among people in all walks of life irrespective of their sex, age education and place of belonging (local or immigrants) All of them, however, do not share communal consciousness to a similar extent Most do not ascribe superiority to one s own community over others or economic polarisation between the communities Nearly one fourth of the population (of course not insignificant, especially with potential of being fanatic) were found to have high communal consciousness which may tend to be fanatical They are found in all social and occupational groups with only slight variation in their proportion High communal consciousness is neither particular caste or class, local or immigrant literate or illiterate group phenomena Significantly neither religiosity nor political participation is related to intense communal consciousness This makes the problem more complex than is generally recognised and requires multipronged strategies to deal with it

Despite predominance of caste and religious individual identity and communal consciousness when it comes to choice on issues, people do not give preference to religious issues over the economic ones Even soon after the riots when communal passions were high, an overwhelming number of them did not give preference to construction of the Ram mandir or masjid over price rise or unemployment Thus, though communal consciousness is widespread and people are susceptible to communal slogans and symbols and may indulge in rioting for the time being, they do not continuously get swept away by communal categories and issues They see that as the game of politicians

Note

[I thank Anjana Desai and Biswaroop Das for giving comments on the draft of the paper, Marzia Culpicewala and Satyakam Joshi for their assistance in supervising the field work]

* Surat has 36 municipal wards The biggest ward has 49 polling booths and the smallest ward has just 3 polling booths We have selected minimum one or 10 per cent of the polling booths from a ward Fifty three polling booths were selected From each polling booth 25 voters were selected with help of random table for interview Total number of respondents were 1 325 From them we could interview 723 Number of them were either wrongly listed or shifted their residence Some were not available at the time of interview they either left the area or were out of station or not available after two visits A few avoided us

Prospects for FDI and Multinational Activity in the 90s

Sebastian Morris

This paper discusses the implications of trends and patterns in foreign direct investment and of the policy and structural changes in India for foreign direct investment in India in the 90s It is argued that while the FDI inflow into India is likely to increase, it would never be anywhere near the $ 4 billion or so per year that is anticipated by the government and hoped for by business By contrast international subcontracting by foreign firms could play a major role in manufactured export growth This is an aspect which, while vitally important for Indian manufacturing, has attracted little attention in terms of policy

THE 80s saw a resurgence of foreign direct investment (FDI) into India This was after a period of very low or negative investments in the 70s FDI grew in current US dollars at a rate that was near 50 per cent on a trend basis but from a very small base [1] It is therefore not surprising that in 1988 it was still only $ 250 million and by 1990 only of the order of $ 450 million per annum Today within the government and among liberal scholars there is much hope that India would be able to attract large volumes of FDI Economic growth in the 80s, at 5 per cent or so, was high in comparison to that achieved in the decade and a half from 1965 to 1979 when the economy grew at an average rate of about three-and-a-half per cent It seems that despite good growth (which rivals that achieved during the Mahalanobis period) and hence good prospects for FDI, restrictive policies among other factors may have worked against large scale inflow of FDI The 90s, therefore with the very liberal policies towards FDI and with the prospect of economic growth continuing at the same rate as in the 80s are expected to attract larger inflows of FDI In this paper we argue that while FDI into India is likely to increase in the 90s, relative to that in the 70s and the 80s, it would never be anywhere near the $ 4 billion or so per year that is anticipated by government and hoped for by business The major reason is that India is unlikely to grow at the same pace that Thailand or China today, and secondly because India is already entrepreneurially advanced relative to the smaller countries of south-east Asia, and a fair diversification of the Indian economy has already taken place Changes in the global economy, particularly the diversification of sources for FDI and the emergence of non-equity forms, reinforce this picture Other forms of transnational activity including international subcontracting could increase

I
Review of International Trends

Large firms including multinationals or transnationals (TNCs) have witnessed major changes in their competitive positions Broadly there has been a substantial decline in the competitive position of US TNCs Japanese TNCs have greatly increased their FDI into the advanced capitalist countries (ACCs) and the LDCs, and western European firms while under threat from Japan have also increased their participation in the US market primarily through direct investments There are other changes of a more macro economic nature Variations in growth rates between US Japan and western Europe the very real prospects of an increasingly unified European market large trade surpluses of Japan, slowing down of growth world over including in the LDCs emergence of greater competition in the supply of technology, particularly in the more 'mature' technologies, are all important in understanding the prospects for particular countries as sources of investments in India

In Africa given that it is still at an early stage of development much of the FDI has been in extractive industries and in others related to transport and trade Recession in the ACCs in the 80s has led to falling demand for the natural resources of the LDCs, particularly African and Latin American, which has also restricted FDI

In contrast many of the countries in east and south east Asia have generally witnessed substantial FDI flows during the 80s though there have been major variations among them Malaysia, Singapore Thailand and China have had vastly increased investments in the 80s In the Philippines and Indonesia the growth was less in the 80s than before

South Asia on the other hand has attracted far smaller amounts of FDI This is due no doubt to the low levels of income in these countries, small markets (except in India) and to rather poor growth performance

From the trends in the FDI to the LDCs in the 80s it is without doubt clear that countries with high growth of manufacturing output and with policies favourable to FDI have been successful in attracting large FDI flows, particularly in manufacturing and in manufacturing related industries The mere existence of attractive policies and incentives of various kinds to potential investors, or regimes liberal to FDI, is certainly not enough Otherwise many low income countries and many of the Latin American should have attracted large volumes of FDI in the 80s Good growth and largish home markets are the key to inward FDI, particularly so for countries with moderate to high population densities and no great endowments of natural resources

The emergence of pluralism ought not to directly affect the prospect for the quantum of FDI into a country like India Yet, besides the diversification of the sources of FDI and technology in general the propensity for non equity forms including joint-ventures has certainly increased since Japan and German firms are less prone to majority-owned affiliates and have shown a greater tendency to sell technology It seems therefore that for the same growth potential in the market the overall quantum of FDI inflows would be reduced

An important development in the 80s, which will certainly continue into the 90s, is the increasing flows of FDI into the services sector About 40 per cent of the stock of all FDI in the mid 80s and about 35 per cent in the late 70s were in the services sector implying that the flow during the 80s would most certainly have consisted of at least 50 per cent in the services sectors [2] The bulk of FDI in services consist of financial services including banking and trade related services The expansion in financial services was intimately linked to the early spread of transnational banks and the development of the Eurodollar and later Euro currency markets as well as to the need to serve abroad affiliates from the same home country Deregulation innovation of new financial instruments such as securitisation of debts, development of telecommunications and information processing and increasing links between capital markets of the major industrial powers were factors underlying the steep growth in transnationalisation of financial services in the 80s a growth which

was largely confined to the ACCs. In the near future the growth of such investments into the LDCs, if the immediate past and the present of south-east Asia is any indication, would lead us to believe that FDI in services would be marginal in the LDCs. This is because the basis for these investments lies in the transnationalisation of other sectors, and to the movement of people across countries for business and pleasure. Their role in the highly transnationalised economy of Singapore is large. The city's status as a metropolitan centre has created a role for service investments that link it as a financial and commercial centre to London, New York and Paris. Thailand, South Korea and Indonesia, on the other hand, show very much smaller levels of FDI stock in the services sector, which is related to the stock of manufacturing FDI systematically.

In the 80s and continuing into the 90s there has been a great liberalisation in the LDCs' policies towards FDI. In the 80s when LDCs were left chasing for FDI there was little functionality in LDCs pursuing restrictive and confrontationist policies against market-oriented FDI. Also many an LDC undergoing structural adjustment under Fund/Bank auspices was as part of the adjustment programme required to liberalise greatly its policies towards foreign capital. With the large number of countries going in for structural adjustments since the second oil crisis (1979-80) there has been virtually a scramble for competitive liberalisation in the LDCs in the late 80s, leaving transnationals to pick the most lucrative and prospective markets, viz, those of the fastest growing LDC economies, including China.

Yet we must not underestimate the role of ideology and example in the liberal attitudes to TNCs: The success of South Korea, Taiwan, Singapore and Hong Kong, and of others that attempted to closely follow them, in their external orientation aspects—Malaysia, China, Thailand, and perhaps Indonesia—was far too remarkable, and gave rise to the thesis of 'export-led' growth and industrialisation.[4]

II
Non-Equity Forms of FDI

Developing countries have made systemic efforts to un-bundle the package of ills, competencies and resources that constitute FDI. Countries at an earlier stage of development like many in Africa have restricted their attention to Africanisation of the workforce and to participation in ownership, whereas in others pursuing an independent strategy such as India, government action has sought to bring down the cost of technology import, discourage FDI when technology could be purchased outright, or when licensing arrangements were feasible. Such developments have given rise to the so-called non-equity forms of transnational participation in the LDCs. In the literature licensing agreements (when not with majority-owned affiliates), management contracts, purchasing contracts, international long-term subcontracts, joint-ventures (especially minority-owned) are recognised as channels of non-equity transnationalisation. Equally importantly, the pluralism of FDI in the 80s, and particularly the rise of Japanese firms, and now Korean in many standard items, as technological leaders in many an industry, has widened the sources of technology and skills for LDCs, and has increased the bargaining power of LDCs, especially the dynamic NICs and large countries like India and China pursuing a more self-reliant industrialisation strategy.

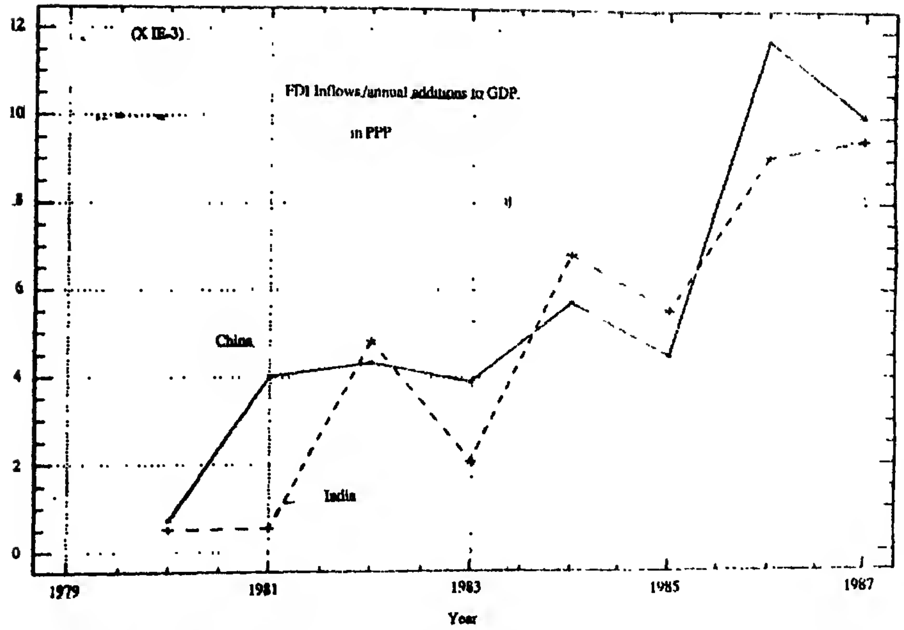
Non-equity arrangements are generally found in areas that use 'stable' or 'mature' technologies. Similarly newer TNCs and particularly those from LDCs, as also those losing their competitive advantages, have shown a greater tendency to establish non-equity forms of transnationalised operations. Since non-equity forms involve the combination of indigenous entrepreneurship with technology and other competencies from outside, their prevalence and success depends vitally upon the strength of local entrepreneurship.

III
Manufactured Exports and FDI

FDI in natural resources (or non-equity forms of transnationalisation when these are more meaningful) takes place without reference to the stage of development of the host economy when the competence to develop them is not locally available. TNCs are always available to develop such resources as long as there is sufficient demand for them in the home country and in world markets. Similarly given good prospects and a not too small market and protection, TNCs readily invest to serve host LDCs' domestic and regional markets in manufactured products. And much of manufacturing investments in LDCs are indeed of this variety. On the other hand *the role of FDI in manufactured exports from the LDCs is rather small despite impressions to the contrary*.[5] Much of the increases in manufactured exports from Korea, Taiwan and the other NICs have taken place from domestic firms. Transnational affiliates have been sources of less than 5 to 20 per cent of the manufactured exports from the NICs, except Singapore where the role of affiliates has been high.[6] In export promotion zones, transnationals are active in manufactured exports through the so-called runaway industries. But several considerations would attenuate their importance for a country like India: Firstly, very few countries have been able to attract such runaway industries at a significant level and all of them have had close political and sometimes military links with the US (South Korea, Mexico, Taiwan, Thailand, Singapore, and the Philippines). These along with Malaysia were hosts to as much as 90 per cent of all EPZ employment of just about 1.6 million in the mid-80s.[7]

But the role of TNCs and other firms based in the ACCs in manufactured exports from the NICs has been vital, principally as marketing channels and as sources of subcontracts for innumerable small and large domestic firms. It is here that the role of retailers and buying agents from the ACCs, the Shogo-Shosho, and the purchasing departments of large manufacturing firms, including their specialised trading firms is important. Manufactured exports through such arrangements have till recently almost entirely bypassed India in the 70s and 80s.[8] As protectionism in the ACCs strikes deeper roots, 'independent' exports by the LDCs would become increasingly difficult.

An important aspect of ACC firms' purchases of manufactured products from the LDCs is what is generally called international subcontracting. We may usefully consider international subcontracting to consist of two archetypes: (1) Purchases by retail and chain stores. (2) Original equipment manufacturing (OEM) arrangements. These constitute an important channel for the manufactured exports of the traditional variety generally based on the existing or given comparative advantages of the NICs. A study by the UNCTC reports that, in 1987, the 11 largest department store chains imported 5 per cent to 25 per cent of the goods which they sold, and that these goods were sourced predominantly from LDCs.[9] In freeing the LDC manufacturer from marketing and distribution, it allows him to concentrate on manufacturing and quality. In items like garments, fashion articles, the arrangement also frees the local enterprise from the need to constantly monitor a distant and unfamiliar market for changes in tastes and fashions therein. It also gives him a large-scale of operations, greatly aiding his movement towards greater efficiency, cost reduction and quality consciousness.[10] Of course a large part of the gains from lower cost and improvement in quality goes to the purchasing ACC—the retail chain stores and the consumers in the form of higher margins and lower prices respectively.[11] But for the LDCs' initially small manufacturers, to miss the process of international subcontracting is to miss the bus altogether. It is very difficult for even a well diversified economy like India to arrange all the ingredients



for successful penetration of ACC markets, at quick enough rates, without dependence on ACC firms or institutions.[12]

Original equipment manufacturing OEM): This is a long-term manufacturng contractual relationship between the ubcontractor and the manufacturing firm from the ACC) to purchase to strict specfications and quality, parts, components, nd sub-assemblies, and products which ll go as part of (or the) original equipnent sold by the manufacturer under its rand-name. Such arrangements have been n existence since the emergence of fordism' in the US, and is at the root of ne success of the automobile industry the vorld over in cost reduction.[13] Internaonal subcontracting of original equipnent rose to prominence in Korea and 'aiwan. There are no reliable estimates of ne volume of trade that takes place due to)EM arrangements. It is estimated that)EM exports from Korea around the mid-0s accounted for 50 per cent of the coun-y's total exports to the US.[14] In the 80s s Korea moved on a growth path realising ynamic comparative advantages, OEM rew most rapidly, particularly in metal ansforming industries and electronic and omputer products and related subassemlies. OEM arrangements cover a wide inge of products from tennis balls, phographic equipment, computers, fork-lift ucks and now even cars and parts of ircraft.

OEM arrangements are hardly possible ith LDC firms which do not have the ecessary technical and managerial capaci- and the bases to meet delivery schedules nd quality standards, and to do so at prices agreed upon much earlier to the final delivery. It is not surprising then that only South Korea and Taiwan with their active and conscious industrialisation efforts and high level of skill formation and with an environment over which business has much control have been able to take advantage of such arrangements.[15]

More importantly for the OEM suppliers, the price realisation is significantly less than through direct sales. Dependence upon the larger foreign firm, and the risk from the foreign firm shifting over to another OEM supplier, perhaps in another country, are other problems. Despite these difficulties OEM arrangements have been widely resorted to by successful Korean and Taiwanese exporters of sophisticated products. Many of the independent exporters of sophisticated products started as OEM suppliers and some like Samsung and Goldstar while they work as OEM suppliers in certain products are independent exporters in others. OEMs can be big markets too: Goldstar, an OEM supplier of colour TV sets to Sears Roebuck of the US, has found the market in its contract with Sears Roebuck large enough for it to set up an affiliate in the US to continue the contract, as its exports came under protectionist pressures.[16] Equally importantly, many large OEM suppliers in some markets are independent suppliers in others.

The above discussion could mean that the OEM relationship, while certainly a dependent one, is not without its dynamism which in an economy that is actively and consciously industrialising[17] can certainly take the OEM supplier to the status of an independent supplier.

IV
Developments in Indian Economy

The new economic initiatives undertaken by the government in 1991-92, which were preceded by policy changes of a more limited extent, are in many ways truly revolutionary. While it is true that the actual change has lagged behind the initiatives and the many pronouncements, what has happened thus far is indeed remarkable. In a short span of time, intentions of privatisation and disinvestment of the public sector and of liberalisation of the financial sector have been expressed. Major control systems (licensing, production and price controls) were either done away with or attenuated very much. Imports were considerably liberalised, and the bias against exports has been significantly reduced and in some instances been removed altogether.[18] More specifically, the policy towards FDI has been much liberalised and today FDI is welcome with little attempt to control the ownership in all but a negative list of industries. The policy for foreign technical collaboration had already been liberalised in the 80s.

The changes go far beyond the requirements of the 'structural' adjustment under Fund/Bank auspices, even though the pressure of these institutions would have initiated and sustained these changes. But the very short-term prospect for growth is not good, given the very conservative credit policies and the fear of inflation, which is shared by nearly all political groups. If the hoped for investments being planned by the private sector are realised growth could be at the same high level as in the 80s. But the kind of 'high speed growth', being achieved by South Korea, China and Taiwan, would not take place, since Indian agriculture is unlikely to grow at the required 5 per cent for this growth. If the experience of industrialisation in the 20th century is any guide such a radical transformation of agriculture is hardly possible without land reforms in densely populated economies, and thus far the new initiatives do not indicate any development in this direction.

Growth has been restricted and 'intensive' in the sense that a wide diversification of the industrial base emerged:[20] Skills and competencies in the entire gamut of requirements for independent industrialisation were attempted to be built up often at great cost. Yet the growth rate was very small, so that industrialisation could not be extensified to embrace a wide section of the population.[21] The limits to this kind of 'restrictive-intensive' industrialisation was reached long ago and the period of the 70s may be considered as an unsuccessful attempt to find new direction. The partial liberalisation of the 80s,

and the favourable conditions[22] for growth obtained during that decade (good harvests, increasing public investments, release of infrastructural constraints particularly in power), and now the general liberalisation of the economy can possibly mark the beginnings[23] of extensification of industrialisation.

The period up to the 80s with the intensive industrialisation can be positively viewed as having built a strong basis for all round growth whatever its cost may have been in the earlier period. Thus today when the economy is being opened up to foreign capital and to imports there is a well developed basis and infrastructure to quickly absorb and internalise the technology and the new skills and competencies. In other words, import of capital and technology could be largely to upgrade the existing competencies, and there would only be a few instances wherein the imported technology goes to produce final goods altogether new to the economy. Indian firms, and the economy in general, have the competence to meet the foreign supplier of technology more than half way.

The unequal and dominant position of transnational affiliates in the Indian corporate sector during the 60s and later, studied by many scholars,[24] has through the late 70s and 80s given way to a more equitable and competitive relationship between Indian and foreign capital. No doubt the change was possible due to the state's industrialisation efforts through planning, active intervention, restrictions on foreign capital, regulation of technology import and specific policies designed to encourage indigenous technology and entrepreneurship; broad-basing the latter to a level that has rarely been achieved in any economy. The natural growth of the market also allowed for the gradual entry of indigenous capital into areas dominated by foreign capital—advertising-intensive and life-style-associated products, and high technology areas. The higher investment propensities of local capital in contrast to that of foreign capital in the 70s and 80s, the advantage that they had under the Indian patent law (particularly in the drugs and pharmaceutical sector), laws prohibiting the use of foreign brand names, government investments in generation of local technologies (particularly in chemicals and pharmaceutical, steel, metal transformation, electronics and electrical engineering) through laboratories[25] and public sector units have all played their parts.

General production expertise, i e, the competence in activities related to shop floor management, maintenance, detailed engineering of plant, project implementation, fabrication (in contrast to design) of plant and equipment to given specifications and design, feasibility studies, market and financial studies, civil constructions of practically all types, infrastructure related design and constructions nearly of all types, competencies in the functional areas of management—production and quality control, accounting and finance, personnel management, marketing, and general management—are all widely and cheaply available in the country. This necessarily means that the unpacking of FDI is likely to be considerable, even when there are no government regulations explicitly seeking to unpackage technology and bring about its diffusion.[26]

These all have the implications for the extent and nature of transnational involvement in the Indian economy in the 90s under a liberalised regime. The large and sometimes pent up requirements of the economy for new and better technologies would mean that foreign collaborations would greatly accelerate in 90s. But much of this for reasons already discussed in this section, as also due to the emergence of pluralism in the sources of FDI and competition between TNCs, would take non-equity forms. Joint-venture forms would have a greater propensity in large investment proposals in areas like basic goods where the sheer size of the project would make Indian entrepreneurs initiating their projects look to their foreign suppliers of technology for part of the finance and sharing of risks as well. Other non-equity forms—purely technical collaboration, licensing, lump sum purchase of technology, minority near-portfolio participation by the foreign technical supplier—are likely to be the most common forms of TNC involvement in the economy.

It is generally believed that much of Indian industry is highly protected and therefore quite inefficient. While this may have been true in the 60s and 70s, in the 80s, even while there are large sectors of Indian industry that are inefficient, many sectors are indeed quite efficient—non-electrical machinery,[27] textiles, automobile ancillaries, computer assembly and manufacture, to name just a few, as detailed studies would show. More importantly it stands to reason that with high duties on most imports, effective protection rates particularly for those with high duties on inputs would be small and often times even negative.[28] The high cost of basic materials—steel (largely due to the failure of the public sector), non-ferrous metals, certain agricultural inputs, imported and domestically produced chemicals, energy (again due to public sector failure)—tend to mask the true conversion efficiency of large sections of the Indian industry, making them appear less efficient that what they are. High excise duties at various stages of manufacture tend to obfuscate the picture even further, so that only careful and detailed studies of EPRs at a fairly high level of disaggregation are meaningful. It is, therefore, hardly surprising that as imports were greatly liberalised due to the movement away from quotas and quantitative restrictions, and to a lowering of tariffs, few industries have suffered to an extent that they had to be closed down due to import competition. Indeed, the decline in the bias against exports has lead to many of them planning to greatly increase their exports. As the home market grows and Indian firms are able to take advantage of economies of scale, their low cost of labour, particularly skilled labour, their relative competitiveness in most areas of production that use mature or standard technologies can only increase *vis-a-vis* both other NICs including China and the ACCs. These offer tremendous prospects for OEM and international sub-contracting besides, of course, technology imports.

It is OEM arrangements that are potentially of great significance to the Indian economy in the 90s. The gains made by the Indian economy during the phase of 'restrictive-intensive' industrialisation can today be easily encashed into fast industrial growth, without running into a skills constraint, if other constraints underlying the extensification of growth were to be removed. OEM arrangements could greatly help to use the large under-utilised capacities in engineering and other industries, in both the public and private sectors of the economy. Today, under increasing competition in passenger aircraft manufacture, firms like McDonell Douglas, and even Boeing the market leader have tied up with plants in Taiwan, China and Japan to supply on contract parts of aircraft with high value addition by skilled labour. India unlike Taiwan or Korea, has large excess capacity in the HAL, for instance, waiting for such OEM arrangements. Large sections of the Indian public sector, in heavy and medium and light engineering, machine tools, electronics, power engineering, as well as of the private sector in machinery and transport equipment, white goods, automobiles, etc, could greatly benefit through OEM arrangements. Successful OEM arrangements would, imply continual reductions in [illegible] not possible unless labour is 'disciplined' enough, and wages do not grow faster than productivity in the organised section of the industry and increasing subcontracting between large and small industry[29] which generally faces the unorganised labour market. If a more meaningful relationship between labour and capital could emerge in the 90s, and the policies that have been biased against exports are given up, it may be possible for India to follow the path (in this aspect) successfully

traced out by Korea, Taiwan and now China, in OEM and other international subcontracting arrangements It may seem that such developments would call for substantially increased growth in the ACCs But the fact is that OEM exports and subcontracted products (other than textiles) in general from India are almost non-existent today, so that gaining markets here is more a matter of the ability of Indian firms to gear up, and of the policy that encourages such relationships, to take advantage of its lower costs to displace such operations in Brazil, Taiwan and Korea. The growth in the overall market for such activities is of less relevance to Indian firms than to those already entrenched.

FDI in the traditional sense of majority ownership could therefore be largely restricted on economic rather than policy grounds to (a) high technology areas and in new products, (b) products of Western culture where the source credibility association are considerable, such as soft drinks, cigarettes, entertainment, toys, fast food, etc Indeed in these sectors we may well see a resurgence of FDI via takeovers of Indian units as the source credibility associations of the Indian consumers undergoing westernisation prove adverse for Indian firms, (c) processing of agricultural products for exports where large scale-economies and new practices are called for, (d) whatever little runaway industries-in the EPZs that India can attract (e) in trade and finance-related services, in the latter if the policy were to change dramatically to favour TNCs, under international, but particularly US pressure, and in the former if export activity via international subcontracting, OEM production and processing of agricultural products for exports were to greatly increase

V
Conclusions

In this paper the implications of the trends and patterns in the phenomenon of foreign direct investments and of the policy and structural changes on in India for foreign direct investment into India in the 90s are discussed It is argued that while the FDI inflow into India is likely to increase in the 90s, it is contingent on the maintenance of the industrial growth of the 80s in this decade too Typically FDI has always followed growth Inflows anywhere near the Chinese level are quite out of question, except in the remote possibility that India achieves the 'high speed' growth of China ('High speed' growth as in Thailand or China is hardly possible without the extensification of growth through the economy, a process that requires agriculture itself to grow fast at about 5 per cent or so)

China's population is nearly 1 25 times the Indian, and its per capita income in 1987 was three times the Indian [30] If both India and China continue with their growth rates (China's being twice as much as India's) into the 90s as in the 80s, China would be adding 7 5 times what India adds to its home market each year For manufactured goods the same ratio would be 10! Is it surprising therefore that it was able to attract about seven to 10 times more net FDI than India? In Figure 1 we graph the ratio of net FDI (World Tables 1987) the change in purchasing power parity GDP[31] over the 80s for India and China We see that the ratio is very similar for both India and China and present broadly similar trends, as both countries faced the same environment for FDI In the 90s as India liberalises its policy towards FDI this ratio can grow a little above China's but not too much FDI into India is more likely to take the form of joint-ventures and other so-called 'non-equity' forms As indigenous businesses have gathered strength over the period of sheltered growth in the 80s, FDI entry into India would rarely be without an active Indian collaborator FDI's role in manufactured exports is likely to be small In contrast international subcontracting by foreign firms could play a major role in manufactured export growth This is an aspect that has attracted little attention in terms of policy, and given the wide diversification of the economy, the low cost of manpower, availability of a wide variety of skills, and large excess capacities, is vitally important for Indian manufacturing It can crucially provide the scale of output to segments of Indian manufacturing which are most competitive, even if at low margins, so that a significant contribution to the extensification of growth is made

In the 90s we would move into an era where the economy and more so the growth therein, rather than the immediate policy towards FDI, is likely to determine both the quantum and form of FDI and related activities

4 The essential conditions (a strong state mechanism and land reforms) for successful industrial transformation in the mid 20th century go far beyond 'open' economies and liberal attitudes towards FDI The details of either their special conditions (metropolitan city status of Singapore, besides closeness to the Chinese market of Hong Kong), or the strong and development-oriented states which obtained in all these countries were lost in the din of the projection of 'export-led' growth Similarly, the decline of 'socialism' and the coming to light of so many skeletons from their cupboards as also the pursuit of destabilisation of regimes still following 'socialistic' policy by the US would today mean that all but the most obscurantist or eccentric regimes would be able to pursue anti-transnational policies
5 See Deepak Nayyar, 'Transnational Corporations from Poor Countries', *Economic Journal*, Vol 88, March 1978
6 This anomalous status is no doubt linked to the metropolitan business centre status of Singapore in south and east Asia In Latin America the role of transnationals in manufactured exports has been high (of the order of 40 per cent), but few of these are destined for the advanced country markets Most of them do in fact constitute intra-regional trade and an expression of the rationalisation of affiliates' operations within the region Cf C V Vaitsos, 'Regional Economic Co-operation (Integration) Among Developing Countries A Survey', *World Development*, 1978, pp 719-69
7 UNCTC, op cit
8 Purchases by the SS have been very important in the export of shrimps and certain varieties of fish from India.
9 UNCTC, op cit
10 Some have argued that such international sub-contracting arrangements were vital to the NICs (principally South Korea, Taiwan, Singapore, and Hong Kong's) quick and successful penetration of ACC markets, without having to go through a phase of 'shoddy goods' that Japan did in the 50s and in the pre-war period China seems to have pursued both paths simultaneously
11 'Export-led' growth has meant significant and sharp decline in the terms of trade of the LDC especially when computed against its main advanced country trading partners This is the inevitable price that Korea, Taiwan and now China pay for market access
12 The experience of Indian trading firms in the ACCs that have woefully failed in the task of manufactured export from India would further confirm this Sebastian Morris, 'Foreign Direct Investment from India 1964-1983 unpublished FPM (doctoral) dissertation, Indian Institute of Management, Calcutta 1988 An attempt by the public sector to set up an organisational equivalent of the shogo-shosha by merging the MMTC and STC along with some other smaller trading firms proved still born
13 In Japan they were given a further boost due to the lower costs of labour in smaller firms and because Japanese culture and management styles made possible stable situations of monopoly facing monopsony, permitting single (or few) highly specialised sub-contractor(s) to supply a single product or a part without the usual farming out to several subcontractors to lower risk typical, of western economies These practices underlay the success of just in-time and other related shopfloor practices
14 UNCTC op cit

15 There are of course problems for both parties in OEM arrangements. Sourcing from OEM producers in LDCs can mean that the ACC firm is vacating the manufacture of that product or component. Its lower costs through the OEM arrangement is possible only as long as its competitors do not have similar access to OEM suppliers, a situation not likely to last long so that OEM sourcing is no alternative to product improvement and innovation by the ACC firm. Therefore such arrangements are not for the long term collective good of the LDCs and they would be bounded by the ACCs' restrictive trade policies.

16 UNCTC op cit

17 Yet we may caution against a general spread of OEM relations in LDCs with the required economic and entrepreneurial base. The confinement of OEM to Taiwan and Korea and to a more limited extent to China may be indication of the need for strong political and perhaps even military understanding between the host country and the dominant ACCs US and Japan.

18 Yet government's effort to reduce the bias against exports has come up against the wall of high excise duties. It cannot lower the input and capital costs for exporting industries without reducing the countervailing duties which get linked to excise taxes and the excise taxes themselves. So presently many an Indian firm finds its transformation cost to be very low but is unable to translate these into the bargain prices required for export penetration.

19 We would think that it is only high growth rates sustained over longish periods that amount to transformation of LDCs into industrial societies. The wide gap between the ACCs and the LDCs in terms of output per annum would mean that if the political and economic constraints to growth are absent economies grow very fast. This is another aspect of late industrialisation.

20 The variety of goods and services produced in India is matched by only the large socialist countries including China and the ACCs and possibly Brazil, Mexico and Argentina.

21 It is remarkable that despite the visibility of India's industrialisation the proportion of labour force in manufacturing is still only a little above that for preindustrial agrarian economies. Employment growth rate in manufacturing has been tardy in the 80s.

23 But not the process itself, since as said before, there are no indications that the agricultural transformation is on.

24 Cf N K Chandra, 'Western Imperialism and India Today', *Economic and Political Weekly*, Annual No, Nos 4, 5 and 6 and part II in No 7, February 1973.

25 It is well known that few laboratories have been able to commercialise their research work and as such government laboratories have (due to their lack of potential links with production enterprises) failed in their task. But diffusion of technologies and skills through movement of people has been significant. A few Regional Research Laboratories, the National Chemical Laboratory, the ISRO and perhaps a few others have no doubt made positive contributions.

26 See Sanjaya Lall, *Building Industrial Competitiveness in Developing Countries*, OECD Development Centre, 1990, for a comparative study of the NICs in technological and industrial development.

27 Cf World Bank, 'Non Electrical Machinery Sub-sector: India', Industry Dept, November, mimeo, 1984.

28 Price based calculations of effective protection as well as tariff based effective protection rates for many industries, particularly for many in the capital goods sector would show that Indian industry is not as heavily protected as what the nominal tariffs alone would indicate. For an early study see R G Nambiar, 'Protection to Indian Industry: Fact and Theory', *Economic and Political Weekly*, January 1-8, 1983. See also World Bank report and for a recent study of the pervasiveness of nominal tariffs see B Goldar, A V L Narayana, Hiranya N Saleem, 'Structure of Nominal Tariffs in India', National Institute of Public Finance and Policy, New Delhi, Paper No 3, July [illegible], mimeo.

29 This becomes almost a necessary condition, given the vast schism between the two labour markets. Large industry has access to only the organised labour market, with very high (though perhaps still lower than in the advanced NICs) wage rates. The unorganised labour market is very cheap, labour is docile and the small industry has access to the same. As yet due to the organisational limitations of the small sector, and the rudimentary development of subcontracting relationships in the economy, the cheapness of Indian labour remains largely unexploited in the world markets. The few exceptions are linked to exports where India has an absolute advantage: polishing of precious and semi precious stones, granite polishing, mica splitting, prawn peeling and packing.

30 World Penn Tables Mark V.

31 China shows a larger trade ratio than India in the 80s which is rather puzzling. But the apparent puzzle disappears when we adjust for the special relationship with Hong Kong. Functionally Hong Kong is to China what Bombay is to India. If one were to include Hong Kong integrally as a part of China, and remove their mutual trade (and investment) then the trade ratio of China becomes less than that for India.

Food Shortages in Russia

Arup Banerji

The maintenance of living standards, public health, even life itself are gravely threatened by the scarcity of food in Russia. These circumstances are more the product of the unaffordability of food than its absolute unavailability. Given the unlikelihood of sharp improvements in productivity, food shortages are likely to persist until at least the next harvest.

THROUGH 1993, the humus of the Russian political terrain altered momentously, the dominant topos of economic strategy shifted and novel themes came to form the staple of arguments within society. Food shortages remained pervasive, even paradoxical, however. In their intensity, these shortages were disproportionate to the degree of contraction in agricultural output, even if this was the fourth consecutive year of decline. Through last year the price of a typical basket of 19 foodstuffs rose steeply (by about 700 per cent), but not as sharply as overall inflation (by about 900 per cent) (Figures 1 and 2). Food producers, particularly grain growers, marketed greater volumes of a slightly shrunken output, at prices that rivalled or outstripped world market prices. More food products were available in retail trade and more bread, meat and dairy products were bought.[1]

But as growing numbers of Russians experienced the debilitating effects of malnourishment, from inadequate real wages (Figure 3) and inflation-driven social polarisation, the incidence of diseases from undernutrition spread and the demographic deficit plumbed depths unusual for peace time. The unaffordability of essential nutrients, especially for the increasing ranks of Russians without a regular wage or salary, rather than any absolute shortage of food is likely to persist till at least the middle of 1994 when the harvest is gathered in. If agricultural output contracts again, or if levels of productivity fail to rise, and the annual rate of inflation crosses the three-digit figure of 1993, outcomes which are not unlikely for reasons to be discussed below, food shortages will inevitably worsen.

Agricultural Output Trends

The extent of the decline in agricultural output last year contradicted most prognoses but it was actually less than the measures of decline in GNP, industrial output and in oil and coal. Although agricultural output fell more gradually in 1993, at about 5 per cent, than it had in 1992, at about 9 per cent, the gravity of the decline was underlined by its relentlessness: between 1990 and 1993, it decreased by a factor of between 17 and 29 per cent, depending on the accuracy of the annual rate of inflation factored into the particular estimate.[2]

Russia and Kazakhstan were the only two countries in the CIS that produced less grain in 1993 than in 1992, but this had a slight effect on the CIS harvest, which decreased by only 4 per cent, to 183.2 million metric tons (net weight, here and throughout).[3] In Russia, within a slightly smaller grain harvest, of 98.9 million metric tons, the harvest of bread cereals like rye and buckwheat dropped more sharply compared with 1992 (see the table), and much of the reduced wheat harvest can only be used for livestock feed. The production of potatoes, vegetables, fruits and berries also fell considerably below last year's harvests.[4] Shortages of feed cereals and the nutritional paucities of what was available caused the number of livestock to diminish through 1993, by 15 per cent for sheep and goats, 10 per cent for pigs, 6 per cent for big-horned cattle and 2 per cent for cows.[5]

In June last year the deputy premier for agriculture, Aleksandr Kharlampeyevich Zaveryukha, had said that in 1992 Russian consumption levels of meat and eggs had relapsed to those prevalent in the 1980s, while Russians had drunk more milk in the first half of the 1960s. Decrements in their production, as well as falling real incomes, he pointed out, caused the consumption of meat and meat products to fall by 14 per cent and of milk and dairy products by 15 to 16 per cent in 1992 against 1991. Although the consumption levels of meat and meat products (by 8 per cent), of milk and dairy produce (9 per cent), and of eggs (5 per cent) had all risen above the extremely low levels of October 1992 by October of the next year, they still lagged behind the amounts consumed before the start of the reform programme in 1992.[6]

From spring 1993, and amidst the gathering symptoms of an early drought in southern and central Russia, optimistic statements about the size of the 1993 grain harvest abounded. In April, Zaveryukha forecast a figure of 106 to 108 million tons, which was level with that of the previous year and lower than the average for 1986 to 1990. In August he mentioned a figure of 120 to 125 million tons (he must have had the bunker weight in mind), and this was even higher than the best recent Russian harvest, that of 1990, of 116.6 million metric tons. Deducting a reasonable 8 per cent from the bunker weight, this estimate, at 107 million tons, presumed a better performance than the average one from 1986 to 1990, of 104.3 million tons. Leonid Cheshinskii, the director of Roskhleboprodukt, the joint-stock company responsible for agricultural purchases for official distribution, had spoken of a (bunker weight) harvest of 115.5 and 125 million metric tons in July.[7] The harvest itself, of course, confounded all these prognoses, and in this welter of almost wild guesstimates, those by SovEkon, at 102 to 105 million metric tons turned out to be most accurate.[8]

What are the prospects for better grain harvests in Russia in the next few years? They will undoubtedly brighten as the process of institutional change in producing units gathers momentum and the under-productive collective and state farms are converted to smaller individual farms. These have already demonstrated a positive ability to reverse declining levels of land and labour productivity and losses of produce, but their future performance is critically dependent on regular supplies of mechanical inputs appropriate for their smaller area, and of fertiliser and credit (their importance is assessed later). On the flat Russian expanses, broken by few wind breaks, soil was and is being swiftly lost because of wind and water erosion, and the productivity of this dwindling reserve of arable area is slipping on account of the inefficient use of plant nutrients and excessively heavy machinery, over-grazing, over-cropping, the ploughing of steep slopes and salination. In 1992, the Russian Federation Committee of Land Use and Land Resources estimated that over half of arable land in the country had become degraded, in the senses of its being excessively boggy, humid and over-acidified

Sown area in 1993 dropped to 61 million hectares from an average of 62.3 million hectares in 1990-92 and 61.9 in 1992, but since the contraction of the harvest exceeded this reduction, lower yields must have contributed to the smaller grain harvest last year. Through 1993, sowing, threshing and harvesting operations oc-

curred later than in the previous year As a flood of reports from the ministry of agriculture iterated this had less to do with the weather and more to do with the state of financial and mechanical preparedness of collective and individual farms

Weatherwise the year had been characterised by higher than average precipitation early in the season, and though this aided crop yields it also necessitated a heightened reliance on labour and machinery to bring in the standing grain before it rotted Higher proportions of essential machinery were in a state of disrepair at the start of the spring 1993 sowing season than had ever been the case in the last four years This affected trucks (20 per cent), tractors (16 per cent) ploughs (15 per cent), seeders (14 per cent) and cultivators (13 per cent) Supplies of diesel fuel and benzene to farms had contracted by about 30 per cent from the previous year's level, and supplies of accumulators, fodder and beet harvesters, and tractors had fallen gravely below those despatched to farms in 1992 The volume of agricultural machinery produced during 1993 had fallen by proportions ranging between 22 and 41 per cent, which was actually steeper than the plunge in industrial output as a whole Ever since the liberalisation of prices in January 1992 the rate of growth of prices for agricultural machinery, fertilisers and pesticides have persistently outrun those for agricultural produce and this has hampered the replacement of spare parts, forced machinery to be unusable for longer, and reduced the application of fertiliser As livestock head declined numerically, greater reliance had to be placed on shrinking volumes of chemical fertiliser, so that according to agriculture minister Viktor Khlystun, the application of chemical agents per hectare has halved in recent years [9]

Cumulatively, this meant that by the end of September, 24 per cent of the grain crop (planted in 13 1 million hectares) had not been harvested and the nature of this delay was accentuated by the fact that by then protracted rainfall in the Urals and Siberia and early snow in oblasts in central and north-eastern Russia like Kostroma, Tver, Iaroslavl and Moscow imperilled the sowing of the winter crop too By mid-October, only about half the country's grain harvest had been threshed [10]

Procurements of Product from 1993 Harvest

The procurement of grain products for distribution by state agencies has steadily risen, in absolute terms from 22 5 million metric tons in 1991 to 26 in 1992 and [illegible]

1993; as fractions of the harvest, too, they rose to 25.3 per cent in 1991, then fell to 24.3 in 1992 and climbed again to 28 per cent in 1993.[11] The purchase of wheat grew by 16 per cent, and of barley and buckwheat by 130 per cent, even as the volume of their production decreased, and this was in contrast to falling procurements of meat and eggs.[12]

The institutional framework for official procurement of agricultural produce has radically changed in the last two years. The process of replacing mammoth centrally-organised collections at administered prices has been almost fully replaced by local purchase activity at competitive prices that are in some real correspondence with costs of production.

The committee for grain products was separated from the Russian ministry of trade and material resources and converted into a joint stock company, called Roskhleboprodukt, by a presidential edict in October 1992, at the beginning of the country's privatisation programme. It was entrusted with obtaining and maintaining a single, federal fund of agricultural products like grain, oilseeds, flour and mixed fodder products, for distribution to the regions by the central authority. The next year, the single fund was bifurcated into the federal and regional funds, for purchasing and maintaining stocks of the same products in 1993. Stocks in the federal fund were destined for the biggest cities, the army, export and the grain consuming (*bezkhlebnykh*) regions of the Russian Federation, like the north and the far east. The regional funds were set up in belated recognition of the forces of regional autarky, or the effort by local authorities throughout Russia (as indeed in the Soviet Union through 1990 and 1991) to retain grain produced or obtained in their area rather than ship it out for central distribution.[13]

The presidential edict of December 24, 'On the liberalisation of the grain market in Russia', marked the apogee of developments that had been gaining prominence since 1990. Their origins lay in an aspect of the fracturing of the unified USSR, the clamour for regional economic self-sufficiency that left few corners of the country unaffected by spring. By the end of that year, all 15 union republics, a score of autonomous territories and even parts of some large cities had declared themselves independent. At a central committee plenum in March 1991, Gorbachev warned regional party secretaries that they would thenceforth have to meet local food and feed needs from local sources, since allocations from the union fund were going to be curtailed.[14]

The timing and essence of these changes were conditioned by their unavoidability: the burgeoning of the private grain market, typified in grain dealings in commodity exchanges (*tovarnye birzhy*). The oscillatory rhythms of private enterprise affected them in various ways, and by the end of 1993 only 180 of the 303 licensed exchanges were functioning, and only 40 held more than two weekly auctions. As the smaller ones were swept away by their inability to attract traders and corner stocks, for in every 10 rubles turned in Russian exchanges came to be earned in just six of them, four of which happened, not fortuitously, to be located in Moscow.[15]

One of the most important and earliest of these grain dealing exchanges was the Moscow-based Russian Commodities and Raw Materials Exchange, founded by Konstantin Borovoi, that conducted its first auction in November 1990. Two years later, the section within it that traded in foodstuffs was the most dynamic in that exchange. By September 1991, 104 state and private (domestic and foreign) undertakings had combined to launch The International Food Exchange in Moscow, and it soon achieved its multifarious aim of unifying the purchase of agricultural products from producers, their processing, packaging, storage and shipment. From September a year later, 12 Russian companies joined to set up the Russian Grain Futures Exchange, that boasted the intention of eventually determining national grain prices in a single futures trading exchange. Grain dealings now occur in several exchanges in Moscow, Stavropol and Krasnodar and in the Russian Grain Trade Exchange in Saratov, the single venue for 60 per cent of exchange-based grain deals.[16]

In 1992, there was a palpable nervousness in official circles about allowing exchange dealers in grain the price-competitive possibility of securing proportions of the harvest that might endow them with a destabilising commercial leverage. Much of these anxieties were allayed last year, by the satisfactory procurement performance of Roskhleboprodukt and the steps taken to dismantle the hallmarks of the command economy in this sphere, like obligatory deliveries and fixed prices, that had worked so conspicuously to the disfavour of official agencies. By December, it was clear that the results were primarily reflected in inflationary wholesale prices, apparently a less worrying result than the accumulation of substantial stocks in the exchanges.

The presidential decree on the grain market was momentous in several respects. Compulsory deliveries and other forms of forced removal of agricultural produce had already been abolished from 1994 by a presidential decree in October, whose central thrust had been to establish land as a form of private property.[17] It marked the culmination of earlier processes by decreeing that all official purchases of grain and oilseeds were to be made at market prices from producers who were free to sell to the buyer of their choice; the centre relieved itself of all supply responsibilities for regions and republics within the Russian Federation, and in future they were to meet their needs from regional stocks; all state-owned enterprises involved with the purchase, primary processing and storage of grain were to be converted into joint stock companies by April 1, 1994.

Finally, and to great import, the decree empowered the centre to guarantee the unhindered movement of grain within the country by taking punitive measures against regional authorities who sought to obstruct grain shipments or the grain trade. These measures could include stopping all forms of federal support to agricultural enterprises, or ceasing to send foodstuffs to areas that were net grain consumers, in regions that hampered this. Regional authorities had often blocked or delayed the export of grain products out of their own regions, and supply plans to consuming regions had suffered.[18]

But a more forceful catalyst to this decree lay in the relentless rise in state (wholesale) procurement prices for grain, since the start of purchases of the 1992 harvest. It was from then that Russian

TABLE CEREAL AND LIVESTOCK PRODUCT OUTPUT IN RUSSIA, 1986-1993
(Million tons, net weight)

	1986-90	1991	1992	1993	1993 as Per Cent to 1992

grain prices on the private market began to move closer to world market ones, even as official procurement prices, on at least 25 per cent of the grain harvest earmarked for obligatory sale, were not permitted an annual mark up of more than 25 per cent Faced with the possibility of escalating sales at free prices, with built-in inflationary expectations for sellers, Roskhleboprodukt steadily raised its prices After being set at 12 rubles a kilogram for bread-quality wheat in August, the price had shot up to 25 rubles for some varieties of wheat by December [19]

Successful negotiations in February and March 1993, between Roskhleboprodukt, on the one hand, and the Agrarian Union and AKKOR (Association of Russian Peasant (Private) Farms and Agricultural Cooperatives), both organised expressions for producers' interests, on the other, kept the price down to this level till the end of April [20] But on April 28, the ministry of agriculture raised wholesale prices again, to R 22 to 51 for hard-variety wheat and to R 20 to 35 for small-size wheat [21]

In late June these prices were raised again, to R 45 to 70 for a kilo of wheat and to R 40 to 45 for barley,[22] only to rise once again in August, after heated debates between the government and producers' organisations, to wheat prices starting at R 60 a kilo and running to over R 80 The Agrarian Union was making a case for wheat prices running from R 86 to 100 at a time when it was apparent that Roskhleboprodukt had funds that could not sustain purchases at more than R 50 By September, the wholesale price for standard wheat delivered to Roskhleboprodukt had climbed to R 84 At the height of the procurement season in August, Roskhleboprodukt was attempting to buy over 4 million tons of grain a week but working on a weekly purchase budget of less than R 100 million rather than R 450 500 milion [23]

On July 30, the government decided to augment the wholesale prices of grain, oilseeds and sugarbeet offered by Roskhleboprodukt at a monthly rate of 10 per cent The ministry of finance strenuously criticised this scheme for its inflationary implications but it was overruled by the imperative need to bolster stocks in the federal and regional funds When it was found that indexed prices had outrun exchange prices within and market prices beyond Russia, the time to end indexation was at hand In late September it was announced that the practice was to cease from October 1 in western and central Russia and from November 1 in the Urals, Siberia and the Far East [24]

Throughout the 1993 grain procurement season, Roskhleboprodukt was hampered by scarce financial resources, in terms of the target it had set for the federal and regional funds and the prices it was expected to offer producers The only circumstance that might have worked in its favour, in specific regions and on particular dates, was a negative one by which the lack of storage and processing facilities compelled producers to sell grain before it rotted, as a not inconsiderable amount apparently did [25]

From the outset of their commercial activity last year officials on Roskhleboprodukt vainly strove to bring the funds at their disposal in closer correspondence with the rising wholesale prices that prevailed on these product markets In striking similarity with the predicament of their NEP ancestors they were the politically advantaged but economically disabled casualties of an unequal rivalry between official and private buyers of the commodity whose price undergirded trends across the economy They ended the race deep in debt By the end of October they had not paid for 40 per cent of the grain they had secured and the debt to grain sellers amounted to R 700 billion and to dairy farmers another R 500 billion By January 1994, Viktor Khlystun had stated that the debt had swelled to R 2 trillion of which R 600 billion ought to have been paid to grain growers [26]

Why Food Shortages Might Intensify in 1994

Russia's strivings towards self sufficiency in food politically laudable as they indisputably are may have been pursued to unreasonable even chimerical lengths Grain imports from countries of the distant abroad, at 11 million metric tonnes had been halved since 1992, when they had amounted to about 25 million tonnes and imports of wheat and corn as well as of soya frozen meat and sugar declined in still greater measure Yeltsin might have been incautious when he recently denied the need for any imports of grain in 1994, because of adequate reserves from the current harvest [27] The bill for domestic procurements in 1993 was, according to one estimate, 10 times more than the bill for imports in 1992 [28] All the available evidence suggests that the improvements in the storage, shipment and processing of food products that are imperative if losses between producer and retail outlet are to be controlled, are stymied by scarce funds The better scale of procurements was, consequently, unmatched by efforts in improving the volumes of domestically utilisable produce This situation might recur in 1994 too

Food consumption levels in Russia have been sliding quantitatively since the start of the decade, as well as receding further from minimal caloric requirements even of a shrinking population If inflationary pressures mount, output levels will need to not only not fall, but grow substantially to neutralise shortages from the devalued currency

An extremely grave consequence of the debts owed to agricultural particularly grain producers is that they were acutely short of resources with which to begin the

FIGURE 2 INDICES OF INFLATION IN 1992 AND 1993

autumn sowings last year which were therefore delayed Further, both the area of land sown in autumn and that ploughed in autumn for spring (1994) sowing declined by 20 per cent as an average for all grain cereals, but by 34 per cent for rye and 12 per cent for wheat All prognostications unanimously concede that even if weather conditions remain as broadly favourable as they have been in the past two years, the reduced area sown to crop in autumn could prompt cereal grain production to slide by 6 to 8 per cent in 1994 The first predictions of the 1994 harvest, as I write, place it at under 95 million metric tonnes [29]

The Russian press is replete with information concerning the devastating impact of inflation, a recent poll found that 84 per cent identified it rather than unemployment (30 per cent) as the prime bane in their lives [30] The government has been more than vociferous in its declarations that it must be reduced to a monthly rate of about 5 per cent by the end of this year, and this is the key goal in the blend of anti-recessionary policies on its agenda [31] By the end of 1993, the annual rate of inflation had been bridled (Figure 1), but this victory in terms of a three-digit figure was fragile because it was crafted by the intrinsically temporary expedient of deferring wage and purchase payments from the budget

Now, perhaps even more singularly than in 1992, the political cleavages in the Russian legislature run along economic faultlines The 'profit-seeking' reformers have been relegated to the margins of decision-making, though not debate, and their criteria of economic effectivity grounded in market generated profits have been eclipsed by other imperatives They confected a recipe for economic advance that laid greater stress on the cost of production of output, its marketability and profitability, than its volume, the battle against unemployment ceded priority to that against inflation This had a profoundly anti-levelling social impact, some aspects of which will be identified below The priorities of the current leadership are somewhat dissimilar Augmenting levels of output by restoring idle productive capacity through generous subsidies and reducing unemployment form the core of their prescriptions for economic recovery, but they too have accorded high status to containing inflation [32]

Unfortunately, this is also a prescription for swelling the budgetary deficit As miners, oil-workers and medical staff, among others in the labour force, strike or threaten work stoppages to press for the payment of their wages or salaries,[33] the printing presses will have to work overtime to meet their claims [34] Through last year nine in every 10 rubles of the budgetary deficit were sought to be made up with new rubles, since tax receipts fell substantially Wage and salary arrears of these magnitudes will undoubtedly bloat the deficit, and jeopardise the targets proclaimed for the reduction of the rate of inflation It is highly unlikely that receipts from taxes will contribute significantly to budgetary revenues this year, because of the trough from which output will have to increase as well as the difficulties in taxing privatised service undertakings

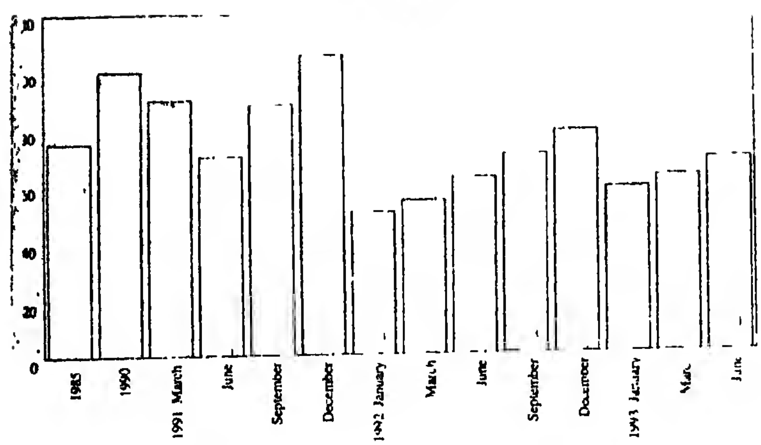
Civilian and military industry, agricultural producers and federal grain purchase organisations are likely to demand, and receive credit that will have a similarly detrimental effect on the health of the budget even if they blunt the edge of opposition hostility [35] As Russian industry seeks to regain domestic market shares in consumer goods lost to imported products since 1992 and arms markets abroad, it can only replace worn out fixed capital and revitalise slack capacity initially and indispensably by borrowing Likewise, cereal sowings and stock raising can occur at better levels this year only if producers are repaid from the yield of fresh loans, for what they sold to official buyers last year and offered loans to neutralise the harsh industrial agricultural price scissors Prolonging repayment might well result in falling output for the fifth successive year

Subsidies to the agro-industrial complex (APK) are likely to have a detrimental effect on curtailing the budgetary deficit through 1994 On February 3, the cabinet decided to appropriate R 14 trillion for the APK in 1994 and to maintain subsidy levels of 1993 intact In addition to this the APK is also to receive R 14 trillion in soft loans for food procurement and R 6 trillion as Central Bank credit for spring sowing According to Andrei Illarionov who recently resigned as deputy director of the Centre for Economic Reform that reported to the prime minister the infusion of R 34 trillion into the APK in this manner would double the amount of money in the economy and send monthly inflation soaring to 50 per cent by June The size of this subsidy to the APK will have to be dramatically sheared before it can make any difference to the budgetary deficit in 1994 that draft budget presumes a deficit of R 55-61 trillion, a sum equivalent to at least 10 per cent of GNP a change in decimal fractions over 1993 [36]

Even if more foodstuffs are available in retail trade this year, through commercial rationalisation and the spread of private trade [7] if higher rates of inflation from output shortfalls and/or a widening of the blades of the wholesale/retail price scissors prevent real wages from improving through 1994 the proportion of family income spent on buying food could cross the 50 per cent mark, having fallen to 46

Figure 3 The Index of Real Wages in Russia

(Average monetary wage/price index in per cent)



Source: *Rossiiskie vesti*, No 148 (317), August 4, 1993, p 3

per cent in 1993 and 47 per cent in 1992.[38] In December 1993, about half the Russian labour force earned a monthly wage that was less than the average wage (R 141, 200). While the wages of 2 per cent of them were less than the survival minimum (about R 40,000), 33 million Russians, or one in every five in the Russian Federation, were officially considered as living on an income below the survival minimum.[39] If inflation levels mount in the next few months, income disparities will sharpen[40] and the growing number of Russians earning threshold or subliminal incomes will be compelled to reduce their consumption of foodstuffs to levels yet unknowable.

This could have calamitous social consequences, accentuated by a phenomenon whose growth next year few now care to contest: rising unemployment. Russian industry has experienced the recessionary repercussions of the transition away from a command economy considerably more painfully than has any other economic sector. With about half its fixed capital worn out, because investment has fallen by two-thirds since 1989, the production reserves in industry are now adequate only for simple reproduction.[41] The rate of enterprise closures, primarily from bankruptcy once an anti-bankruptcy law comes into effect, is likely to accelerate before it stabilises. The unemployment that will have to precede industrial recovery will depress disposable incomes to levels that will aggravate the food shortages.

By the end of 1993, one in every 10 Russians among the economically active population were either unemployed, actively searching for work or working temporary hours. Seven in 10 unemployed Russians were those who had traditionally been, and currently are, most responsible for finding and preparing food for the family: women. At that time last year, 56 per cent of the officially registered unemployed had been without a job for the last four months, and if the average number competing for a vacant job (3.1 persons) was less than in our country, their prospects of finding one before major strides in economic recovery are made are slight indeed.[42] Having risen by 45 per cent in 1993, the number of registered unemployed is likely to grow even faster in 1994, leaving 30 million without jobs by December according to unofficial experts, and between 6 and 10 million, according to officials.[43]

The mounting budgetary deficit, and the irresistible claims for credit or subsidy from enterprise and farm directors will delay the creation of an effective social safety net for those on pensions, or those partially or wholly unemployed. Since the practice of subsidising bread prices ended, in October last year, compensatory income subsidies, although indexed, have been starkly inadequate for the purchase of food items other than the absolute necessities.

But even otherwise, as M Bolgarev, the director of the Institute of Food attached to the Russian Academy of Sciences (PI/RAN) revealed, Russia was losing 'human material' every day. As more and more family dining tables feature just bread and potatoes, he pointed out that children were being born prematurely and with weak immunological resistance as well as cerebral abilities. Since 1989, national per capita consumption levels of meat had shrunk from 75 to 58 kilograms, of milk and milk products from 397 to 298, of vegetables from 91 to 77 and of fruits from 41 to 37. When asked by his interlocutor to react to subscribers who wrote in that food consumption norms approximated physiological minima better in the camps during the second world war than now, he did not find reason to differ. He might have found support in the ministry of labour too: they reported that an adult Russian had an average daily caloric intake of 2,100 kilocalories, apparently insufficient for an 11-year old person.[44]

The effects of all this on the demographic (im)balance elude precise estimation; most demographic analyses of Russia, in the throes of the kind of flux when all that is solid is melting into air (what Judith Shapiro aptly termed 'the psycho-social crisis'), tend to conflate the factor of malnourishment from soaring food prices into a broader ensemble; its instrumentality in aggravating rates of morbidity springing from nervous stress and an accentuated vulnerability to heart failure, themselves the indisputable consequences of rising insecurity, crime and economic hardship, are consensually accepted, however.[45]

In late November 1993, *Nezavisimaya gazeta* titled an investigation into Russia's demographics 'Is Russia Dying Out?'. The author(s) of the unattributed article argued that this was happening in a context of "(the) impoverishment of a part of the population, mass incidence of diseases and undernourishment". The rapidly plummeting demographic deficit, marked by falling birth rates, rising mortality rates and declining longevity, more than amply testifies to its relevance as a query.

Between 1988 and 1992, the number of births had declined by nearly 2.5 million compared to the previous five-year period, and in 1992, for the first time since the end of the world war, the number of deaths (1.32 million) outnumbered that of births (1.24 million). This deficit grew from 0.08 million in the first nine months of 1992 to 0.522 million in the same period in 1993.[46] Russia's population stopped growing in late 1991, and has been shrivelling since. For 1993 as a whole, compared with 1992, the natural deficit amounted to 0.8 million (1.4 million births or 14 per cent less than in 1992; 2.2 million deaths, or 20 per cent more than in 1992), but if inward migration from the near abroad is considered, then this would fall to 0.5 million. The birth rate, per one thousand of the population dropped from 10.7 to 9.2, and the death rate rose from 12.2 to 14.6. Longevity had slipped to the same level as in the early to mid-1960s.[47] Given these circumstances, the prolonged but more effective subsidisation of food and health systems are indispensable, if Russian citizens are to find any hope of confronting the rigours of a transition so misleadingly consecrated as reform.

The sweeping recourse to one or another variant of private food production is the

most eloquent testimony to the sense of despair with which most Russians view official initiatives in this sphere. This is at the heart of the decollectivisation of farms, underway since 1990. Subsidiary allotments, market gardens, joint stock farming companies and private farms have yielded steadily rising increments, often fundamentals, of income and food. Many families have, anyway, been constrained to reduce expenditure on finished food products in favour of cheaper ones that can be produced and processed domestically.[48]

Between 1990 and 1993, the share of total agricultural output that originated outside state and collective farms grew from 24 to 36 per cent. Disquietingly, this growth failed to counter the declining tendency in overall national agricultural output. The variety of producing units that characterise individualised agriculture are not conspicuous grain producers yet. Their output consists, in the main, of vegetables, fruits and dairy products that aid in diversifying and enriching a diet still dominated by carbohydrates.[49] The shift toward independent farming by Russian families is in striking contrast to the efforts of their country in that direction, for it is grounded in levels of productivity and in balance sheets that are more likely to remain positive than the national bill.

The criticality of improved agricultural performance, as the motor for economic recovery in the Russian economy as a whole, has been a central strand of argument in this essay. Food shortages are relative, stemming from high prices rather than absolute availability. Higher levels of productivity at less cost and accompanied by better land use; raising domestically utilisable grain by preventing harvest losses; and, raising the quantum of agricultural investment could have a cumulatively marked effect on reducing them. The determination of wholesale agricultural produce prices must be done with an eye to their impact on retail prices if the negative income-distributory effects of Russian inflation are to be reversed.

The most persistent images to come out of Russia in the last two years have been of a population struggling to survive against the vagaries of reform, the ubiquity of crime, the lack of policy and activity that has addressed social impoverishment—and a seemingly irreversile regime of shortages, most pervasively of food.

Notes

[I am grateful to Ajit Ghosh for the incisive manner in which he smoothed out several logical wrinkles in my arguments; needless to add, the responsibility for the conclusions remains solely mine. I would also like to express thanks to the library staff in my own institution, The Indira Gandhi National Centre for the Arts, as well as in The Russian Centre of Science and Culture and The Institute for Defence Studies and Analyses, for help in locating relevant research literature.]

1 Goskomstat Rossii, 'O sotsial' no—ekonomicheskom polozhenii Rossii v 1993 godu'. *Ekonomika i zhizn*, No 6 (8491) February, 1994, 8.

2 Final assessments of the rates of decline in 1993 against 1992 amounted to 12 per cent for GNP, 16 per cent for industrial output, 12 per cent for oil, and 10 per cent for coal production. See *Summary of World Broadcasts. Part I. Former USSR Third Series* (hereafter *SWB, III*), SU/1931, C/2 [6], February 25, 1994; *Foreign Broadcast Information Service. Daily Report. Central Eurasia* (hereafter *FBIS-SOV*), 94-007, January 11, 1994, 36. The first estimate concerning the decline in gross agricultural output cited was offered by Roskomstat. Experts at SovEkon suggested that the second figure would be more appropriate in a calculus that took proper stock of underestimated rates of inflation, particularly in 1990 and 1991. Understating the rates in these years has been a feature of numerous other assessments of Russian economic performance after 1992. *Finansovye izvestiya*, No 4 (65), February 3-9, 1994, v.

3 *SWB, III*, SUW/0317, WC/3 [12], January 28, 1994.

4 The measures of decline were 89, 90 and 71 per cent, respectively. See the article by Vladimir Scherbak, a deputy minister responsible for the agro-industrial complex (APK), *Rossiiskie vesti*, No 4 (428), January 6, 1994, 3.

5 *Ekonomika i zhizn*, No 6 (8491), February, 1994, 8.

6 *FBIS-SOV*-93-109, June 9, 1993, 50; *Izvestiya*, December 2, 1993, 5. The final estimate for the decline in dairy products through 1993, against 1992, found that meat had fallen by 14 per cent and milk by 17 per cent. See *FBIS-SOV*-94-007, January 11, 1994, 36.

7 These predictions of the size of the 1993 grain harvest were published in *SWB, III*, SU/WO283, A/7 [59], May 28, 1993; *Radio Free Europe/Radio Liberty News Briefs* (hereafter, RFE/RL NB), April 13-16, 1993, 3, supplement to *Radio Free Europe/Radio Liberty Research Report* (hereafter *RFE/RL RR*), Vol 2, No 17, 1993; *SWB III*, SU/WO293, A/12 [89], August 6, 1993; RFE/RL NB, June 28-July 6, 1993, 5, supplement to RFE/RL RR, Vol 2, No 28, 1993; and, ibid, July 19-23, 1993, 5-6, supplement to RFE/RL RR, Vol 2, No 31, 1993.

8 See Finansovye izvestiya, No 4 (65), February 3-9, 1994, v. In an interview in August to a correspondent from ITAR-TASS, Andrei Sizov, the director-general of SovEkon, had estimated a net grain harvest in 1993 of 106 to 108 million metric tons, but said it could easily be less. Rossiiskie vesti, No 174 (343), September 4, 1993, 3.

9 *Ekonomika i zhizn*, No 17, May 1993, 10, No 6 (8491), February 1994, 7; *SWB, III*, SU/1692, C1/10 [1], May 19, 1993; *Rossiiskie vesti*, No 148 (317), August 4, 1993, table on p 5; No 174 (343), September 4, 1993, 3; *SWB, III*, SU/1632, C3/2, March 9, 1993.

25 This was the essence of the argument advanced by Cheshinsky who went on to say that agricultural producers preferred to forgo benefits from rising grain prices by postponing sales, and were more inclined to combat industrial price inflation by acquiring cash from the sale of their produce See the interview to Anatoliy Diordienko *Rossiiskie vesti*, No 163 (332) August 25, 1993, 3 See also *Pravda* November 16 1993, 2, *SWB III* SU/W0295 A/12 [93] August 20 1993 In any case according to deputy minister for agriculture Vladimir Scherbak about 30 per cent of agricultural produce was lost between farm and retail outlet *FBIS SOV* 93 245 December 23 1993, 48

26 *Finansovye izvestiya* No 4 (65) February 3-9, 1994, v In Khlystun's estimate of the R 2 trillion debt owed to rural producers R 600 billion comprised the debt owed by consumers for subsidised agricultural products supplied to them, and R 800 billion represented budgetary support that had not been received by these producers See *SWB III* SU/1894 C/1 [1], January 13 1994 ibid SUW/0317 WC/3 [13], January 28 1994

27 *Finansovye izvestiya*, No 4 (65) February 3-9, 1994, v, *Financial Times* March 10 1994, 1 In January the relevant Russian officials estimated wheat and animal feed import requirements at 12 million metric tons in 1994, ibid 1

28 Andrei Illarionov estimated that Russia would spend $ 22 billion (14 6 bn pounds) on its attempts to reach self sufficiency in food, an amount that was 10 times more than it spent on food imports in 1992 The accuracy of this estimate is flawed by its being based on current exchange rates and so not deflated for the devaluation of the ruble to the dollar See *Financial Times* February 4 1994, 3

29 *Ekonomika i zhizn*, No 6 (8491) February 1994, 8, *Finansovye izvestiya* No 4 (65) February 3-9, 1994, v

30 Stephen Sestanovich, 'Russia Turns the Corner', *Foreign Affairs*, Vol 73 No 1 January February 1994, 92

31 This is the target rate that both Yeltsin and the IMF want Russia to achieve, and that the latter has made one of the pre conditions for releasing a further tranche of aid worth $ 1 5 billion But Chernomyrdin declared that he would be content if it fell to between 7 and 9 per cent a month *Financial Times* March 5 6 1994 2

32 In an interview in January, Chernomyrdin said that the government's priorities were equally divided between combating inflation and presenting a catastrophic decline in production See *Ekonomika i zhizn* No 4 (8489), January 1994, 1 He reiterated this in March when he succinctly summed up the dilemma facing his government, saying that it would have to tread on a razor's edge' between rising inflation and falling production Gaidar said that "there is no such dilemma Economic decline is by and large caused by our failure to adhere to tough monetary policies ' *Financial Times* March 5 6, 1994, 2

33 To instantiate coal miners have staged strikes in Vorkuta and the Kuzbass, in the latter region, miners were promised 1 5 trillion rubles in back wages Oil workers in the Siberian Tiumen claim salary arrears amounting to an average of 5,00,000 rubles a month for three months *Financial Times*, February 17, 1994, 2

34 On January 22, 1994, the Russian government decided to double the amount of money it would ask the Central Bank to print in the first three months of the year, from seven to 15 trillion rubles to bridge the budget deficit This was decided before the draft budget was presented to the cabinet (February 7) It might be coincidental that the inter enterprise debt then amounted to about 15 trillion rubles *Financial Times*, January 24, 1994 1 February 4 1994, 3, February 5 6, 1994, 2

35 In an interview in January Chernomyrdin hinted that cutting the rate of inflation was almost predicated upon the government not repaying its most burning debts' to defence enterprises, the far north, the agro industrial complex and back pay to budget financed enterprises *Ekonomika i zhizn*, No 4 (8489), January 1994 1

36 *SWB III*, SU/1915, C/4 [5] (a) (b), February 7, 1994, *SWB III* SU/1931, C/2 [6], February 25, 1994 See also *Financial Times*, March 5 6, 1994 2 It does appear that both the cabinet and the ministries of economics and finance have recently confirmed that these subsidies will be trimmed, but to an extent not yet known

37 Retail trade turnover in the private sector jumped to 71 per cent of the total in 1993 from 62 in 1991, within this, consumer purchases of non food items apparently grew faster from private outlets than did food purchases, but these too rose markedly *Ekonomika i zhizn*, No 6 (8491), February 8, 1994

38 Ibid 9

39 This was the proportion reported in the annual report on the Russian economy by the State Statistical Committee See *Ekonomika i zhizn* No 6 (8491), February 1994, 9 It might have understated the case by using an estimated survival minimum income higher than that used by the ministry of labour At the end of 1993, the ministry of labour discovered that about 49 million people, or one in every three Russians, fell into this category See *SWB III*, SUW/0314, WA/6 [7], January 7 1994 This was confirmed in another annual assessment of the economy See SWB, III, SU/1931, C/2 [6], February 25 1994

40 By December 1993, the incomes of the richest 10 per cent of Russians exceeded that of the poorest by 1,100 per cent, a marked deterioration since December 1992 (750-800 per cent) as well as December 1991 (450 per cent) *Ekonomika i zhizn*, No 6 (8491), February 1994, 9

41 Pavel Bunich, among the leading Russian economic analysts singled out these aspects of industrial collapse in a recent interview See *FBIS SOV*-94-007, January 11, 1994, 36

42 *Ekonomika i zhizn*, No 6 (8491), February 1994 9 These are national averages that need to be tempered with the observation that unemployment is more than twice as bad in republics like Mariy-El, Dagestan, Chuvashiia, Adygeia or Mordovia, and oblasts like Pskov Iaroslavl or Ivanov The RF ministry of labour released its end year findings on unemployment in February 1994 See *SWB, III*, SU/1915, C/2 [3], February 7, 1994

43 *Finansovye izvestiya*, No 4 (65), February 3 9, 1994, 1 For illuminating, if arguable, details about present and future levels of Russian unemployment, see the report by Francis Williams on a study of this phenomenon in 348 enterprises conducted by a team from the International Labour Organisation, *Financial Times*, February 8, 1994, 3

44 See the interview with M Bogarev in *Argumenty i Fakty*, No 4 (693), January 1994, 5, *SWB, III*, SU/1779, C2/2 [8], August 28, 1993

45 In its section on demographics, the official economic survey for 1993 reported that 3,48,000 Russians had died during 1993 from 'trauma-related causes', and this was 1 4 times greater than the number the previous year *Ekonomika i zhizn*, No 6, (8491), February 1994, 9

46 'Rossii vyimiraet?', *Nezavisimaya gazeta*, No 225 (649), November 24, 1993, 1

47 *Ekonomika i zhizn*, No 6 (8491), February 1994, 9 For details in English, see an article by John Lloyd entitled 'Russia Faces Population Crisis as Death Rates Soar', based on information presented by Natalia Rimashevskaia, the head of The Institute of Socio-Economic Studies of the Population, Moscow, to The Harriman Institute, New York, *Financial Times*, February 14, 1993, 1 For the comment in the text above by Judith Shapiro, see the same article The life expectancy of males born in 1993 is just 59 years (Lee Hockstader, 'Death and Disease Rates Soar in Russia', *Guardian Weekly*, Vol 150, No 11, March 13, 1994, 18)

48 I have attempted to probe the origins, nature and dynamic of individualised agriculture in Russia in an article that will appear this summer in a special issue of the India International Centre Quarterly, devoted to contemporary Russia, with M K Palat as the guest editor

49 For the shares and trends in the production of vegetables and dairy products in the private sector through 1993, of about three-quarters and one-third of respectively, see *Ekonomika i zhizn*, No 6 (8491), February 1994, 8, Ibid, No 49 (8482), December 1993, 24 (interview with Zaveryukha), *Finansovye izvestiya*, No 4 (65), February 3-9, 1994, v

'If this is Tuesday... it must be Social Roles'

Sociology and Challenge of Gender Studies

Sharmila Rege

THE discussion that has followed Veena Das's analysis of the 'Crisis in Sociology in India' [Giri 1993, Murthy 1993, Deshpande 1994] encourages me to react and comment on the state of the art in Maharashtra. I see this comment as a step in collecting data from different regions and towards forming a base for what G B Venkatesha Murthy has called reorientation workshops [Murthy 1993]. These will have to be different from the 'refresher' courses and will have to be consciously guided towards building a community of discourse [Giri 1993]. To avoid centralisation and metropolitanism in building such communities of discourse, a series of local and regional level deliberations would be necessary as a preliminary step. Such a strategy has been adopted by the all-India network of women's organisations and has led to more participatory and democratic proceedings at the national conferences. Satish Deshpande has aptly expressed our 'collective ineffectiveness' and most of us would agree with him that 'brilliance' or 'innovation' is collectively and institutionally reproduced [Deshpande 1994]. The preconditions of innovation require a further analysis of the state of our syllabi, our pedagogical practices and our responses to challenges from within and outside the academia.

Sociology at the 'general' and 'special' levels is offered in 19 colleges in Bombay university, 10 in Pune and 62 in Marathwada [Dhanagare 1993]. D N Dhanagare has shown how student enrolment drops at the level of specialisation in sociology [Dhanagare 1993]. Discussions with students reveal that on the college campus sociology majors are perceived as inferior students. Many of those who opt for sociology as major reveal that it is a soft choice. ("Syllabi are general, marriage, family and all that sort, and do not require rigorous study as in economics or practical lab-work as in psychology.") For some sociology was preparing ground for the civil services or a Master's degree in social work. The few who had made a 'conscious choice' in opting for sociology complained of thinly constructed courses which they argued were weak—both on intellectual achievement and critical reasoning. For students coming from the mofussil areas, majoring in sociology widens their chances of acquiring a clock-hour basis lectureship in non-grant colleges which have been mushrooming in Maharashtra. Most students confessed that they did not put in any extra reading at the MA level and could manage easily with their 'BA notes'. Those who did put in extra reading were troubled about the lack of links in the syllabi between history, theory, contemporary issues and their personal lives.

A review of the syllabi of Nagpur, Bombay, Marathwada and Kolhapur universities reveals that in all these universities there is a course on concepts (usually covering structure, society, culture, stratification, deviance, social control, etc); one on 'Indian Society' or 'Indian Social Problems' (usually covering joint family, caste, social reform, with some units on 'Muslim and Hindu view of life') and compulsory courses on Sociological Thought and Research Methodology. Most courses give a reading list of prescribed textbooks dated between 1950s and 1970s. There is a dearth of reading material in Marathi and what one often has are translations of a mix of the mass-marketed American textbooks. These mass-marketed American textbooks attempt to cover an array of topics with concepts, statistics, graphs and attractive photographs drawn largely from white, middle class American contexts with 'conscious attempts' to 'include' blacks and natives at places. [See, for example, the very popular Broom and Selznick 1955.] When basic sociological concepts are read from these texts, they emerge not as expressions and critiques of lived situations but as abstractions which become even more abstract when supported by illustrations that are remote from lived contexts. It is no surprise then that most of us who crammed MacIver and Page's definitions of 'marriage' and 'family' and supplemented them with a 'Hindu view' and 'Muslim view' never really thought of these institutions as sites of contestations and struggles. Compulsions of brahmanical patriarchy become naturalised within these course structures and this is only one example of such naturalisation. The point I am making is that there are hardly any interlinkages made between the basic concepts and the trajectories of their development in sociological thought and their utility or otherwise in our lived contexts. The different courses offered at both the degree and post-graduate levels would therefore appear as disjunct circles if represented in a venn diagram. In the absence of courses on social history of the region and social thought in India, all that we are left with are half-hearted pleas for indigenising theory. It is not very shocking then that in the midst of the violence that followed the 'Naamantar issue' of the Dr Babasaheb Ambedkar Marathwada University, many students shrugged their shoulders and flippantly commented that much more noise has been made about a name and 'a rose by any name .. etc'. Such comments pose the challenge of 'Sociology for what and whom'?

One such challenge to the social sciences comes from Women's Studies. Women's Studies initiates a critical dialogue, a dialogue arising out of the realisation that one is at once immersed in and alienated from one's discipline. As Marcia Westkott comments, "The personal struggle of being both an insider and outsider is not only a source of knowledge and insight but also a sense of self-criticism" [Westkott 1988]. Feminist debates in sociology have been mainly directed at issues of content and method. In calling attention to women's invisibility and rejection of the notion of women's natural inferiority, the assumption that self and society are mutually reflective and supportive was questioned. From these criticisms of content were derived feminist criticisms of sociological methods, feminist methodologies in sociology addressed themselves to consciousness-raising through research, challenging the dichotomy of subject and object of research and the complex questions of power in writing and research [Reinharz, Wright, Bombyle 1983]. Indian feminists have been struggling against the parasitism of academic agenda to the first world [Uberoi 1993]. Use of such methodologies in the Indian context requires shift from 'woman's standpoint' to a standpoint that bears in mind the complex collusions and contestations between castes, class, gender and communities.

The UGC responded to these challenges by granting 22 Women's Studies Centres to different universities. In the usual style, evaluation committees were set up and the centres graded, the metropolitanism being apparent in this grading. Located in one such Women's Studies Centre which is a part of the Department of Sociology, I would like to highlight the critical impulses and self-reflexivity that the 'gender challenge' could offer to sociology in India. However, universities have answered the challenge by formulating 'optional' courses on 'Women and Society' (only offered in Pune University and Goa in the western region) and letting the 'mainstream', 'foundational' courses go unchallenged. Though a few sociologists viewed this challenge as having critical and emancipatory potential, by and large this challenge got translated into 'pub-

lishing gender' (series of books on 'Women and ' came up, lacking in critical reflections) or into a strong opposition and defensive stance ('do you mean to say participatory research was not undertaken by any sociologist?', etc) The All India Sociological Conference' 1993 had a panel on 'Gender and Society' Barring a few papers most focused on 'Status of Women' or reiterated the existence of patriarchy (Abstracts, Panel IV), thereby ignoring both the theoretical and methodological challenges posed to sociology In fact in her theme paper, Sujata Patel points out the importance of gender sensitivity in the studies on caste and kinship and comments that sociology in India has not integrated these critical issues in its discourse in a cognitive manner [Patel 1993]

"If this is Tuesday, it must be Social Roles" [Baker and Rau 1990] This statement aptly describes the state of pedagogy in sociology Rethinking of these practices is one of the major challenges posed by feminist pedagogies Feminist pedagogies legitimise personal experience recognise that both teachers and students bring texts of their own to the classroom and that 'common vocabularies are not given and need to be developed This is not an easy experience as this pushes us from positions of authority into vulnerability but it is healing as it infringes emotionality into intellectuality Self reflexivity and critical impulses cannot seep down from above, they have to be rooted in conscious praxis in the classroom

[My sincere thanks to D N Dhanagare for sharing with me the findings of the Status Report of the western region on Sociology Teaching and Research in Universities 1993]

A Sceptical Note on 'Secularism'

Arup Kumar Sen

THE philosophy of secularism is organically linked with the discourse of modernisation So it is quite natural that the 'modern elites of post-colonial India preached secularism in their respective domains as a civilising mission On the other hand the Indian state embarked on a process of nation building that did not take into account the mentalities and aspirations of the masses This elite mass cleavage has been successfully appropriated by the proponents of Hindu nationalism in recent years to get a foothold in Indian politics The present crisis of the Indian state calls in question the vague and pragmatic notion of secularism which it used as a hegemonic concept in the management of the polity Rethinking the concept of secularism on the part of the Indian intellectuals is an attempt to grapple with the present crisis in the theoretical domain Very recently, one scholar has given the call to integrate the 'question of faith' in the discourse of secularism so that it can capture the minds of the people [1]

In his discourse on secularism (*EPW* March 5), Andre Beteille has made a distinction between normative and empirical questions And he has defended secularism from a normative standpoint The Indian university has also been empirically defended in his discourse as a secular institution But the problem with this secular institution is that it does not have any dialogue with Islamic educational institutions Muslim youth educated in the reputed Indian *madrasas* often go to west Asian Islamic universities to obtain an MA in Islamics But they are not generally regarded as 'degree holders' in India These 'MAs' cannot get registration as PhD candidates except at the Aligarh Muslim University [2] According to Beteille, the presence of the Aligarh Muslim University and the Benares Hindu University might appear somewhat anomalous in contemporary India" But it should be kept in mind in this context that without the presence of the Aligarh Muslim University many Muslim youth in India would have been deprived of the present privilege of higher studies in Islamics One can question the relevance of studying Islamics in contemporary India from a 'secular' standpoint What subject will get priority in the field of higher education is a question of state patronage My point is that the opinions of Muslim intellectuals should be taken into consideration in the education policy of the state in order to ensure a secular management of our polity

In his normative defence of secularism, Beteille as a sociologist, argues that "there exists a close affinity between secularism as a general orientation to the world and sociology as an intellectual discipline" In this context, he laments that "our two leading sociologists have recently expressed themselves either negatively or in sceptical terms about secularism But it is quite logical if one doubts the efficacy of a western category of knowledge in explaining the dynamics of Indian society I would like to mention here that the word secularism' has been translated in Urdu, the *lingua franca* of Indian Muslims, in a derogatory sense as irreligion [3] It is quite impossible to integrate the question of Muslim faith in the concept of secularism

The rise of the BJP and other aggressive anti Muslim forces in Indian politics poses a direct threat to the survival of Indian Muslims But the 'secular' rule of the Congress Party did not ensure security to the Muslims in their everyday life The following episode gives an idea of the nature of suspicion that gripped the minds of the Muslims about the intentions of the Congress Party in the mid-70s The number of pilgrims at the *urs* festival in the holy city of Ajmer came down from 3,00,000 to 1,00,000 during 1975-76 One reason for such low attendance in 1976 was "a general fear among Muslims in India that they were subject to victimisation in the sterilisation campaign during the political emergency" [4] Such deep-rooted suspicion in the popular Muslim mind about 'secular' state politics in India should be kept in mind before offering a normative defence of the philosophy of secularism

Three generations of small savers. There's one thing they all trust–Units.

Even people generations apart think the same way when it comes to Units. Because Units help make their dreams come true.

Whether it's a young man saving for a house of his own. Or an older man looking forward to a comfortable retirement. Or a little girl dreaming of becoming a doctor some day.

Unit Trust has schemes to meet every need. Whether the need is for high growth or liquidity. Whether it's tax benefits or good returns coupled with insurance cover.

People know that with Unit Trust, they can get what they want. That is why the number of Unit holders is going up so spectacularly. To over 33 million today. Most of these people are small savers. They come from every part of the country. They come from every walk of life. They have different needs, different dreams.

But they share the same abiding confidence in Unit Trust. Living up to this confidence is what keeps us going. And growing.

Profit making.
Dividend paying.
Liberal bonus.

Public Issue of 16,66,000 Shares of Rs. 10/- each at a premium of Rs. 30/- per Equity Share Aggregating Rs. 666.40 Lakhs

HIGHLIGHTS

* An existing Profit making dividend paying Company * Liberal Bonus Issues Three Bonus issues in the last ten years The original paid-up capital (in cash) was Rs. 25 Lakhs and the Company has 19 Shareholders * Expansion Scheme already operational No gestation period * Increased thrust in the export market FOB value of Export during 88-89 & 89-90 is Nil and during 1990-91 1991 92 and 1992-93 is Rs 67 88 Lakhs Rs 146 34 Lakhs and Rs 285 82 Lakhs Respectively * Promoters are in the field of Taxtiles since two decades * Consistent high capacity utilisation over 95% in the last 5 years * The spinning unit project is appraised by IFCI but with no financial participation by IFCI The Hotel Project in which investment will be made is appraised by TFCI with financial participation by TFCI & IFCI * Tax benefits under section 80HHC 80L 80M of the Income tax Act 1961 & Wealth Tax benefits * Easy liquidity Listing at Madras Bombay and Ahmedabad Stock Exchanges

NOTE Issue price as computed under the formula of erstwhile CCI at 12% capitalisation rate is Rs 31 04 * Investors may note in case of oversubscription the allotment shall be on a proportionate basis and a SEBI nominated public representative shall be associated in the process of finalisation of basis of allotment *

RISK FACTORS

EXTERNAL

* Major Raw Material being Cotton and Polyester Staple Fibre and Viscose Staple Fibre the price and availability thereof are subject to fluctuations

INTERNAL

The company anticipates good orders and no market survey has been conducted to support the claim * There is disputed income tax liability of Rs 82 10 Lakhs for which no provision has been made in the accounts * The Company executed two Guarantees one in favour of Andhra Pradesh Industrial Development Corporation Limited for a sum of Rs 90 Lakhs for the Term Loan sanctioned by A P I D C to S L S Textiles Limited and another for Rs 590 Lakhs in favour of TFCI & IFCI for the Term Loan sanctioned by them to Sri Tripurasundari Hotels Limited * Regular Production in Unit II at Pallikonda was scheduled to start in July 1993 as per IFCI appraisal report and the same is rescheduled to July 1994

MANAGEMENT'S PERCEPTION OF THE RISK FACTORS

— The Management has two decades experience in the field of Textiles which enables it to take strategic decisions with regard to purchase of Cotton, Polyester Staple Fibre and Viscose Staple Fibre

— As the management has more than two and half decades of experience in the textile field and as there is good demand for yarn both in the domestic and global market, the company does not anticipate any problem in marketing and shortage in demand.

— If any demand arises out of the disputed income tax liability the company will be able to pay the same out of its accruals.

— As the term loan for which the company has given corporate guarantee to the term lending institution is repaid as per schedule by the borrower company no liability on this account is likely to arise.

Note: The investors are advised to refer to the para on justification of premium before making an investment in this issue.

If the Company does not receive the minimum subscription of [illegible] of the issue including devolvement of underwriters within [illegible] days from the date of closure of the issue the Company shall forthwith refund the entire subscription amount received. For delay beyond [illegible] days if any in refund of such subscription the Company shall pay interest as per Section 73 of the Companies Act [illegible]

Trade Liberalisation and Indian Agriculture

The process of macro economic stabilisation combined with fiscal adjustment and structural reform will have a significant impact on Indian agriculture particularly insofar as it moves domestic prices of inputs and outputs closer to world prices. At the same time, the conclusion of the Uruguay Round of multilateral trade negotiations will inevitably change the structure of relative prices for agricultural commodities in the world economy. Taken together, these developments have serious implications for India, not just in the agricultural sector but in the economy as a whole. Despite the importance of the issue, it has received little attention from scholars and policy makers. 1187

Double Burden

Health systems in developing countries have come under increasing strain in recent years. While much of their 'old burden' of ill health resulting from communicable diseases and under nutrition still remains, 'development' has generated new health problems related to increasing environmental degradation, ageing of the population and dietary excesses and errors associated with relative affluence. 1204

Not Pro-Women

The Allahabad High Court judgment on talaq has created the erroneous impression that it safeguards the rights of Muslim women. In fact, the judgment weakens their position by validating the discriminatory aspects of the Land Ceiling Act. 1169

Political Issue

The real issue in the privatisation of IISCO is not economic or technical but political and so has to be faced politically as part of our struggle for economic independence against the neo colonial assault in the new unipolar world. 1171

Missing

The government of India as also the state governments have launched programmes for designing improved models of cooking stoves, but why has the acceptance levels of the new stoves been so low and the impact almost negligible? Is it because the critical element—the woman—has been missing in them? 1176

Polarisation

Behind the reactivation of the agricultural workers' struggle for better wages in Bihar is a deepening of the socio political polarisation which is taking place in the state's remote rural hinterlands. 1174

Secularism and Common Man

Secularism may be discussed and argued about by an intellectual minority but the risks and anxieties which confusions about secularism generate profoundly affect the common man. 1224

Police Rule

The growing number of cases of human rights violation by the police being brought to the courts and reported in the press prompted the National Human Rights Commission to visit Punjab and Chandigarh last month, but given the advisory nature of the commission and the unhelpful attitude of the state and central administrations, it may not be able to fulfil the expectations raised by it. 1172

Whole Picture

It is not until income distributional considerations are brought into the picture that the social profitability of an infrastructural public investment project can be fully assessed. 1210

Social Indicators

India is one of the few developing countries which have a fairly extensive statistical base on different social and economic indicators of development. Nevertheless, the task of presenting a consistent picture of the evolving socio economic condition of the Indian population is not an easy one. Special statistics on the social indicators of development. 1227

Enemies Inside

It is wishful thinking to imagine that the goal of cultural and political autonomy in Indian society can be achieved simply by taking a collective decision not to be trapped or lured by western sensibilities and striving for a reconstruction of indigenous or 'authentic' belief systems and values. 1181

LETTERS TO EDITOR

Eradicating Kala Azar and Malaria

ON March 16 and 17 about 50 people from various local groups like the Pradhan Sangh (headmen's organisation) of Maheshpur, voluntary organisations like Navjeevan Seva Mandal, nurses from the Sohorghati and Mariam Pahar dispensaries and doctors from Jaljhari and St Luke's hospital, Hiranpur, gathered at Kodma to discuss the health situation in the district

In 1986 Borio block alone had more cases of kala azar than any district in Bihar. In fact this block had more kala azar cases than any other state in India. The government surgeon had refused to give them DDT to spray in the area saying that he would send his own staff to do the spraying. They never came. Hopna Murmu of Sona Santal Samaj spoke about his group's effort o control kala azar and malaria in four anchayats of Borio block by spraying DDT. They attended the meetings in the zilla arishad office, where the District Development Commission had agreed to provide hem the sprayer, pesticide and money for his work. But later this promise too was roken. Still, as they were given prior otice, organisation members voluntarily ccompanied the government workers and upervised the spraying for two consecu-ve years. But this year the government did ot inform them in advance and work has een incompletely done in the villages that ave been visited so far. Now the govern-ent is asking for bone marrow test, in lace of the aldehyde test that has been used diagnose kala azar for the last eight years. eople are frightened and are not taking the overnment medicines. May be it is being ackmarketed instead. Others pointed out at the bone marrow test was not being one in most blocks

The next day a memorandum was pre-red summing up the discussion of the th and presented to the civil surgeon who as accompanied by the district Kala Azar ontrol Officer and Jawahar Singh from entral government sponsored organisation sponsible for kala azar control in Bihar. e memorandum provoked a heated bate. The government officials protest- that they were forced to work according guidelines that came from above. The al people present expressed their shock t those posted in Sahebganj could still t speak either Malto or Santali (speakers hese two languages comprise as much as per cent of the population in the worst ected block of Litipara) The voluntary anisation staff were frustrated that the ernment co-operation was so poor that trol of malaria and kala azar had become ossible and as a result people were ng without treatment.

inally a three-point Action Programme agreed upon: (1) A diagnostic camp would be held in Litipara. Bone marrow testing would be done and the result supplied the same day. Medicine would also be distributed by evening. If up to 25 per cent of the patients refused the test, they would he clinically examined by a doctor, an aldehyde test would be done and treatment started on this basis Such diagnostic camps could be held anywhere in the district at 24 hours notice. (2) The civil surgeon agreed to provide the DDT spraying schedule. Copies of this could he supplied to the organisations so that they could inform the villages and educate people about the need for spraying and how it should he done. If any village was not covered at the end of the first round of spraying, steps would be taken to punish those responsible for the lapses. (3) The three-year policy on kala azar would be reviewed this year and the following issues would be raised at that time: opposition to the bone marrow test; need to appoint local people for spraying work; and need to supply one sprayer to each village.

Gopalsamy's Politics

K GEETHA RANI's letter on V Gopalsamy (March 26) reads like a public relations handout. And like any public relations handout, it too is premised on a number of falsehoods.

Her claim that Gopalsamy is "above all caste biases" smacks of ignorance at best. Among other things, Gopalsamy's annual pilgrimage to Pansumpon, year after year, to pay homage to late Muthuramalinga Thevar (well known for open hostility to dalits and support to militant Hindu chauvinism) tells its own story. His pilgrimages have no doubt earned him the support of the Thevars. Whether Gopalsamy is above all caste biases can be decided only by those dalits who still cherish the memory of Immanuel who was slaughtered in broad daylight by Muthuramalinga Thevar's henchmen for mobilising the dalits.

Geetha Rani's characterisation of S Thangavelu's current position in Tamil Nadu politics reminds one of patron-client relationships. Of course, Gopalsamy can play the patron: he is after all one of the inheritors of Kalingapatti zamin. But to reduce Thangavelu to a client is hardly a sign of democratic politics In any case, it is a myth to claim that Thangavelu is emerging as a leader of the dalits in the state. His only contribution to the militant dalit politics which is slowly emerging in Tamil Nadu is to keep away from it. The simple fact is that Gopalsamy needs a dalit to whitewash his upper caste politics and has co-opted Thangavelu.

Now to the Kurinchankulam incident in which dalits were brutally killed by naidus. There is nothing to claim that Gopalsamy intervened to defuse the tension, while it is an open fact that his brother Ravichandran represented the naidus in the peace negotiations organised by the district collector.

There can be a hundred and one reasons to be disenchanted with Karunanidhi and his politics, but there is none to be enchanted with Gopalsamy and his politics. What can one expect from Gopalsamy who compares M G Ramachandran with Ajanta paintings and continues to discover gentlemanly traits in Advani?

ECONOMIC AND POLITICAL WEEKLY

Place for a Quick Killing

THE reluctance is of an extraordinary genre Try to extract from official sources some hard data on direct foreign investment that has actually taken place in the more recent years The government will hum and haw, and keep referring to the data on projects approved by the Foreign Investment Board A cryptic reply to a parliamentary question has elicited at least some niggardly information between 1991 and March 1994, actual direct foreign investment aggregated around Rs 3,400 crore or just above $ 1 billion On the assumption that, after a slow build-up, the tempo of such capital inflow really picked up in 1993-94, perhaps as much as two-thirds of the estimated investment between 1991 and March 1994 took place in 1993-94 In other words, direct foreign investment in the fiscal year that has just ended was around Rs 2,250 crore, which works out to only one-third of 1 per cent of national income

Overall capital formation in the economy has, on the other hand, declined by something like 3 to 4 per cent since the late 1980s This has happened because of the erosion of domestic savings, and such erosion is causally linked to the principal tenets of the government's New Economic Policy in capital letters The 8 or 10 or 15 per cent of the community who had the capability to save additionally have been offered multiple allurements to go all out for luxury consumption The domestic rate of savings has dropped because it has been the cardinal objective of official measures to ensure its decline The votaries of consumption-led growth know their mind They have dropped the poor and the needy from their agenda If, through some means, a double-digit rate of growth could be sustained year after year in the demand for luxury durables and non-durables, India, they are convinced, would be able to carve out her place among the world's economic high-fliers The rest of the momentum, one needs hardly add, is expected to come from spiralling exports

This particular hypothesis of growth therefore rubs out domestic savings making any substantial additional contribution to capital formation, it simply is not possible for the upper classes to contribute to both consumption and capital formation at the same time The demarcation of responsibility the hypothesis envisages is therefore obvious whatever extra capital formation would be called for over the years to propel and sustain the economy on a high growth path has to come from external sources That is to say, the supply side of the growth function is going to be the responsibility of foreigners

Direct foreign investment at the current rate—the equivalent of only one-third of one per cent of national income—cannot clearly meet the bill The magnitude of non-portfolio capital inflow must soar and soar, reaching the peak of perhaps 5 per cent of national income in the course of the next few years, and must stay put at that level, if not over an infinite time horizon, at least for a couple of decades

Either this is a pipe dream, or it is not In case it is a pipe-dream, the hypothesis on the basis of which our policy-makers have proceeded in recent years would go bust. Were that to happen, the epoch of liberalisation and globalisation would come to an abrupt end For our policy-framers, therefore, it is a matter of life and death that the flow of direct foreign investment is lifted from the present paltry level of around Rs 2,000 crore per annum to the region of Rs 30,000 to Rs 40,000 crore Wishes unfortunately are not horses, nor do gushing figures of approval of foreign investment proposals fructify automatically into actual capital inflows of any sizeable magnitude The prayer to foreign deities such as Standard and Poor to upgrade our credit rating, and pronto, may sound plaintive as well as desperate But there are solid objective reasons for mounting such a prayer

Messrs Yeltsin and company had nurtured hopes about foreign capital inflows to the several republics in which the erstwhile Soviet Union has disintegrated They are now wiser Only fly-by-night operators prefer to invest in territories that have been rendered the happy hunting ground of goons, blackmarketeers and pimps, and the exits of such operators are as fleet footed as their entries The Indian prospects are unlikely to be any better The government in New Delhi may continue to ignore stubbornly the report of the Joint Parliamentary Committee on the Scam, but since information too is now globalised, the gnosis has duly reached foreign shores choose India if you want to make a quick killing, the appurtenances for which will be made available to you in plenty, shun India if you prefer a stable environment for your capital

However morose the story, there is a non-flip side to it Imagine the chaos in monetary management that would have ensued had Rs 40,000 crore of foreign money started flowing into the country each year, the measly flow of direct foreign investment has saved us from that particular predicament Should this sound like sour grapes, so be it

POLITICS

Strategy-Planning Season

IT may not be an entirely irrelevant exercise to try to divine the thrusts and directions of the flurry that marks the Indian political stage at the moment. In the strategy planning season that is on with the rounds of state assembly elections due within the next 12 months and the Lok Sabha polls less than two years away, political parties have all stepped up their reconnoitering activities. This involves not only probing the areas of inter-party relations but also intra-party, even inter-person equations both inside and outside the respective parties. The disorganised and disintegrating situation in which the main centrist formation that is the Janata Dal finds itself today has no doubt opened up a wide range of possibilities for ambitious and wily operators. Leaving aside the secondary question of inter-person liaisons, there are three major areas of exploration engaging the attention of the strategy planners at the moment. First, the position of the BJP and the position of the other formations and forces *vis a vis* the BJP; second, the state of the Janata Dal and the inclinations of its individual ranking leaders; and, third, the consolidation and articulations of the backward dalit combination in different states and regions. These three factors will largely define the parameters of operations of the fragments of the Janta Dal associated with stalwarts like Devi Lal and Chandrashekhar which will in turn affect the final configuration in one way or another. A crystallisation of these processes will in turn determine the orientation of the regional parties like the TDP, Akalis, AGP and even AIADMK/DMK and also their linkages with the national formations, and thereby influence the overall outcome of the people's verdict.

The results of the by-elections for the seven Lok Sabha and 17 assembly seats in 13 states due at the end of May will no doubt reveal the lie of the land and will more purposively reorientate the moves and the counter-moves in the next phase.

The final outcome of this preliminary phase, that is, the eventual line up for the 1996 Lok Sabha polls, will however be fashioned by two basic factors: first, to what extent the BJP and its charismatic leaders are able to derive benefits from the 'synchronisation of opposition' that is objectively taking place *vis a vis* the ruling Congress party, and second, to what extent the present liberalisation and structural reform policies of the union government will adversely affect the broad masses via rising inflation and galloping unemployment.

At the moment, however, Left and progressive forces are not displaying adequate awareness of the steady gain in respectability by the BJP that is resulting from the party's clever exploitation of the clumsy moves of the ruling party in the matter of the Indo-US palavars and the anti-national edge of its current economic policies. The BJP is perhaps drawing some indirect benefits also from the moves by the Left and progressive forces who are engaged more in abstract denunciations of the GATT agreement than in targeting the material impact of these policies of the government on the life and living of the people.

For adequately intervening in the above two processes as also for its intrinsic value, the Left and progressive forces have also to intensify their work for advancing the course of stimulating and articulating the urges of the backward dalit combination, oriented towards a real restructuring of society at the grass roots level.

EMPLOYMENT

Pipe-Dreams and Reality

AMONG the more serious misgivings about the government's economic reform programme is the one relating to its adverse effect on employment. After the initial bravado about bringing the economy back to a path of rapid and sustained growth of output and hence of employment, government spokespersons have been sounding notably defensive. Presenting the 1993-94 budget the finance minister could only claim that "professional prophets of gloom who were predicting millions of people becoming unemployed" had been disproved. Considering that the fears of worsening of unemployment as a result of stabilisation and structural adjustment policies are based on the actual experience of many countries, they call for a more honest and serious response. Yet in his latest budget speech, the finance minister chose to quote the decline of 1.4 per cent in the number of persons on the live registers of employment exchanges between 1992 and November 1993 as evidence of reduction of unemployment, when official agencies concerned with the compilation of employment exchange statistics themselves have repeatedly emphasised their undependability for passing any judgment on the employment situation.

Now we have two official pronouncements which acknowledge the seriousness of the unemployment situation in the country. First, an official of the Planning Commission has estimated that the economic reforms will lead to the loss of 1 million jobs in the industrial sector over the next two to five years. Seventy per cent of the job losses will be in the eastern region comprising West Bengal, eastern UP, Bihar and Orissa, about 50 per cent will be in private sector firms while some 4 to 4.5 lakh will be in the public sector. The other official revelation was by labour minister P A Sangma in the Rajya Sabha. Admitting that the government had not been able to make a dent in the growing unemployment because of the low GDP growth in the Eighth Plan so far, Sangma said that at the end of the Plan there will be as many as 34 million unemployed compared to 23 million at the Plan's beginning. Impliedly total employment generation during the five year period would be 24 million or an annual average of 4.8 million or 1.6 per cent in contrast to the Plan target of 8 to 9 million or 2.6 to 2.8 per cent.

Further, the basis of the Eighth Plan estimates of employment and unemployment is a comprehensive study undertaken by the Planning Commission in May 1990 which had estimated the backlog of unemployment (those unemployed on the 'weekly status basis' and those severely underemployed) at 28 million as on April 1, 1990. The study had projected the rate of increase in the labour force at 2.2 per cent per annum, that is an addition of 37 million during the aborted Eighth Plan period from 1990-91 to 1994-95. The present Eighth Plan which is to run from 1992-93 to 1996-97, assumes labour force growth at about 2 per cent or an addition of 35 million in the five year period. The population census of 1991 has, however, confirmed that the total labour force (main and marginal workers together) grew at 2.4 per cent per annum during the 1980s. The growth is unlikely to be lower in the 1990s. The Eighth Plan figure of an addition of only 35 million to the labour force is thus an under-estimate. The figure should be at least 41 million.

Similarly, the backlog of unemployment at the beginning of the Eighth Plan estimated at 23 million too requires a second look for a variety of reasons. In the first place, the interregnum of two years between the Seventh and Eighth Plans saw severely depressed economic conditions in the country. The *Economic Survey 1993-94* has brought out that in 1991-92 employment growth had been only about 3 million. Even if it is assumed that employment growth in 1990-91 had been 6 million as it was a good agricultural year, the backlog of unemployment at the start of the Eighth Plan should be at least 28 million.

The backlog of 28 million and the addition to the labour force of 41 million suggest that the employment requirement in the Eighth Plan would be as much as 69 million or nearly 70 million. Taking the labour minister's realistic assessment that only some 24 million jobs will be generated in the five-year period, the backlog of unemployment at the end of the Eighth Plan will be not less than 42 million compared to 15 to 18 million as envisaged by the Eighth Plan or even 34 million as projected by the labour ministry.

There is enough corroborative evidence pointing to depressing employment prospects in the country. First, there was a steady

decline in the rate of growth of employment from 2.82 per cent in 1972-73 to 1977-78 to 2.22 per cent in 1977-78 to 1983 and to 1.55 per cent in 1983 to 1987-88. This happened despite the acceleration in the growth of the economy to 5.6 per cent and in industrial growth to about 8.5 per cent in the latter half of the 1980s. While agriculture and the organised sector experienced the sharpest deceleration of growth of employment, the rural non-farm sector, particularly rural manufacturing, and the unorganised sector in the urban areas showed over 4 per cent annual employment growth. A rough exercise based on alternative assumptions regarding (a) growth of employment in the organised and unorganised sectors and in the rural and urban areas, (b) employment elasticity of sectoral GDP growth, and (c) actual sectoral growth of GDP, yields figures of employment growth in the first three years of the Eighth Plan (1992-93 to 1994-95) of not more than 15 million, compared to the target of 24 to 27 million.

Secondly, even taking employment exchange statistics, trends in fresh registrations and number of vacancies notified, which are more reliable indicators than the number of persons on the live registers, show a rise in registrations in April-December 1993 of 10.7 per cent and a decline of 6 per cent in vacancies notified. This is not surprising because government establishments and public sector undertakings have not only not been recruiting fresh workers but have been shedding a part of their existing workforces. For instance, the estimated strength of all central government establishments (excluding non-civil defence) was 41,39,256 as at the end of March 1992 and came down by 4.6 per cent by March this year. Similarly, according to the Bureau of Public Enterprises, total employment in the reporting central PSEs was at a peak at 22.36 lakh in March 1990 and it came down to 21.37 lakh by March 1993. True, according to an answer to a parliamentary question, there was some improvement in employment in the organised public and private sectors—from 187.72 lakh in March 1990 to 192.10 lakh in March 1992 in the public sector and from 75.82 lakh to 78.46 lakh in the private sector. Another answer in parliament indicates that small-scale industries generated employment growth of 7 per cent in two years, from 125.20 lakh in March 1991 to 134.07 lakh in March 1993. However, all these put together do not add up to prospective employment growth of more than 1.6 to 1.7 per cent (5.5 to 6 million) per annum compared to the Eighth Plan target of 2.8 to 2.9 per cent (8 to 9 million) per annum.

Finally, recognising the declining overall employment-elasticity, the Eighth Plan has rightly emphasised the scope for raising employment in the agriculturally underdeveloped regions, in agro-based and allied activities, in rural manufacturing and other non-farm activities in the rural areas and in small-scale and decentralised manufacturing in urban areas. However, the structural adjustment policies seek to shift the relative balance decisively in favour of the organised sector which has recognisedly a lower employment potential. At the same time, the share of public expenditures earmarked for agriculture and the unorganised sector as also for economic and social infrastructure has come down and so the prospects of acceleration of the rate of employment growth in these sectors are dim. The spread of industrial sickness is likely to increase open unemployment in the medium term. The spread effects of expansion of the organised sector on the unorganised sector will depend on whether overall industrial growth can be pushed up to about 8 to 10 per cent—which does not appear to be on the cards, at any rate in the Eighth Plan period.

COMMUNAL RIOTS

Farce of Punishing the Guilty

IF the BJP is guilty of destroying the Babri masjid and unleashing communal riots that killed thousands of Muslims, the Congress(I) is equally culpable for the nefarious plan to kill 3,000 Sikhs in Delhi and elsewhere in October-November 1984. Like the BJP, the guilty Congressmen also have managed to escape scot-free due to a deliberate policy of procrastination and masterly inactivity during the last 10 years

In an effort to curry favour with the Sikhs, the BJP government of Delhi has decided to reopen the cases against the Congress leaders accused of the killing. Senior leaders like H K L Bhagat and Sajjan Kumar as well as some top police officials were named in 21 cases which were recommended for registration by the government-appointed Jain-Aggarwal Committee several years ago. The Congress government at the centre dragged its feet on the recommendations, and its police quite often acted in a desultory manner, like some time ago when it went to arrest Sajjan Kumar, but meekly retreated in the face of protests from a crowd of Congress supporters.

After coming to power, the BJP appointed yet another committee, which again recommended immediate action on the cases earlier mentioned by the Jain-Aggarwal Committee. Following this, the BJP chief minister, Madan Lal Khurana, requested the Lt Governor, P K Dave, to act upon the recommendations. On April 22 Dave directed the home secretary to ensure that the 21 cases were acted upon.

A curious drama then followed. The home secretary disappeared from the scene—supposedly on leave—as a result of which the orders never reached the police. Soon after that, Dave himself was reported to have withdrawn his earlier directive to the home secretary. Chief minister Khurana accused Dave of stalling his own orders under pressure from the central government.

Finally, on May 6, the Delhi police received official orders for registration and investigation of the cases recommended by the Jain-Aggarwal Committee. But while Khurana asserted that the police would register eight cases and conduct investigations into 11 others, the Delhi police till now has acted on five cases only. Police officials claim that they are not aware of any other cases.

The entire drama has all the appearance of a well-orchestrated farce. While the BJP chief minister is spewing fire against the guilty Congressmen, and pleading helplessness in punishing them because of the tardiness of the Congress rulers at the centre, his colleagues in the party and the 'Sangh parivar' are grateful to the same Congress rulers for adopting the same policy of tardiness towards the issue of punishing Hindu communal leaders and the 'kar sevaks' who demolished the Babri masjid. In spite of a legal ban on the VHP, the fanatic 'sadhus' and 'sants' of that organisation are allowed to operate openly and spread communal venom. The Congress rulers have been liberal enough to be equally forgiving towards the killers of Sikhs and the Muslims. The BJP should not have any grouse.

If the accused Congress leaders of the 1984 massacre are at all punished—a remote possibility—they may be prosecuted because of internal squabbles within the Delhi Pradesh Congress Committee. Bitter factional quarrels have erupted between Sajjan Kumar and H K L Bhagat, the two prime accused in the 1984 cases. Who among the guilty of 1984 will be punished may finally depend on who among the Delhi Congress mafia wins the battle for power.

ABORTION

Landmark Law

LAST week the US Senate passed a historic piece of legislation on abortion rights which reverses the trends which had set in during the last many years. It makes illegal protests against abortion clinics and those who conduct abortions. The bill which has already been passed by the House of Representatives now awaits the president's assent.

The bill bans physical obstruction of abortion, with non-violent offenders being fined $10,000 and six months' imprisonment and violent first-time offenders being fine $1,00,000 and one year's imprisonmen This marks emphatic support for abortion a right and is likely to influence opinion t world over. It is also a recognition of t increasing importance of the women movement as a political constituency.

The abortion issue in the US has been the subject of debate for more than a decade. The process of liberalisation began in the 1970s when in the famous Roe vs Wade case the Supreme Court recognised women's right to abortion. But the demand to legalise abortion taken up by a dynamic and growing women's movement was pitted against a church-backed right-wing reaction which was both anti-abortion and anti-contraception. This opposition to abortion became concretised with the reversal of the Roe vs Wade decision in 1989 and many American states passed laws outlawing abortion. These circumstances gave rise to violent reactions to attempts to reopen the debate. The Reagan era with its emphasis on so called family values and its support to Christian orthodoxy spurred the right to life movements who pitted foetal rights against the case for legalising abortion. In states where they were permitted to operate, abortion clinics were attacked and doctors and health workers who performed or assisted in abortions were threatened. In Florida a doctor was murdered by these extremist groups. In all this/the medical profession has taken an ambiguous stand. While it has condemned the criminalisation of abortion, it has taken no clear stand on abortion as a woman's right. In fact, even historically it was the American Medical Association which had in 1859 demanded that the practice of abortion be banned. This has been true of most other medical groups in developed countries (*EPW*, November 27, 1993).

The US movement against abortion has had its repercussions, especially in Latin American countries. For instance, even under the Sandinistas, Nicaragua was unable to come to a clear stand on abortion and in many east European countries the more liberal attitude to abortion has been reversed as part of the resurgence of orthodox Christian values and the backlash against state coercion. Quite clearly, it is only if the right to abortion becomes more than a civil rights issue or a medical issue that it has a chance of being recognised.

The other side of the coin is of course that in many third world countries, India included, abortion has long been legalised without it ever having been a demand of the women's movement. Commentators have noted that abortion services have been seen as part of the family planning programme and lack or failure of contraception is sought to be made up for by making abortion available. This has had the wholehearted support of the international population lobby, especially US-based groups like the Population Council and others who have funded population control programmes in these [illegible]untries. There are two factors which are [illegible]en overlooked: one that repeated abor[illegible]s are detrimental to the health of women [illegible] two, that the experience of all women, irrespective of their marital status and the reasons for seeking abortion, seems to be uniformly humiliating. The dominant attitude appears to be that abortion is morally insupportable. In other words, while there is no widespread open or violent opposition to abortion, in the absence of a progressive attitude which views it as an aspect of reproductive freedom, it is difficult for women to view abortion as a right.

EAST EUROPE

Beginning, Not End

A correspondent writes:

AFTER Lithuania, Poland and Ukraine, the former communists are back in power in Hungary as well. In Hungary's first round of elections held recently, after 99 per cent of the votes had been counted, the Hungarian Socialist Party, which is the name the reformed communist party has adopted, had won 33 per cent of the votes while the Hungarian Democratic Forum, the senior coalition partner in the incumbent centre-right government, could only garner a poor 11.7 per cent. The Liberal Free Democrats came in second with 19.7 per cent of the votes, and the Agrarian Independent Smallholders with 9 per cent and the Christian Democrats and the Young Democrats with 7 per cent each just about managed to find a place in parliament for which it is necessary to win at least 5 per cent of the votes. Although the socialists may not do as well in the second round of elections to be held on May 29, this win puts them in a position to form at least a coalition government in alliance with the Liberal Free Democrats.

Only last month, in April, the communists and their partners had emerged victorious in Ukraine's parliament. Before that in Poland in September 1993 and in Lithuania in November 1992 the former communists had already come back to power. While some may see a pattern in this resurgence of the former communists in ex-Soviet and eastern European territories—a tendency that may have more to do with nostalgia than with hard political analysis—and may try to draw, on that basis, optimistic conclusions about the future of socialism, prudence would suggest the adoption of a more cautious approach. Such an approach would immediately lead us to see (1) that the so-called communists in east Europe have, over the last half a decade or so, made major changes in their ideology and political strategy, as a result of which they are now, effectively, social democrats; (2) that their popularity has a lot to do with the mismanagement of the economy and the neglect of social policy by the ruling parties during the ongoing period of transition; and (3) that the reason why it is the social democrats rather than, say, national-chauvinists who are being shown favour by the people may be that, due to the ideological and organisational structures that they had inherited and have now expediently reformed, the former communists are able to present a more coherent and functional front to the people.

Apart from the ideological and organisational changes that they have made in their parties, the social democrats in all east European countries are committed more or less to a market type economy and want integration with western Europe and membership of NATO. It is also well to remember that social democrats in western Europe, who in some countries have tasted power for long stretches of time, have been evaluated by people strictly on the basis of their performance in government, despite their concern for social welfare and security and their stress on social policy. On any evidence of lack of governmental competence on their part, the people have punished them by throwing them out of power and by bringing the liberals or conservatives back in. This is bound to be the pattern in the east European countries too where the communists as social democrats are moving back into positions of governmental authority.

The west European experience of social democracy—and of communism, for all communist parties there have essentially been social democratic parties—is certainly not one that can be valorised by those who want to see a deeper and longer lasting egalitarian arrangement in all societies. At the same time, it is increasingly becoming clear that this exactly is the experience that people in all democratising societies, including the east European ones, are likely to encounter. What is important, therefore, is not to feel elated over the victory of former communists but to ponder over the alternatives, if there are any, to this, what at the moment seems to be, the only viable outlet for left-leaning and radically-inclined aspirations under the given economic dispensation.

Another thing that cannot be too much emphasised is that after the experience of communism—'actually existing socialism' as some liked to call it—and its not too distant denouement, after the all-too-visible ecological catastrophe that the world is now witness to and after the emergence of 'new social movements', the search for new alternatives must begin from a plane altogether different from the one where a similar search had begun more than 150 years ago. One reason why this search led into a blind alley, it is now clear, was its easy dismissal of so-called 'bourgeois' notions of democracy. A similar dismissal of 'social democracy' seems to be fraught with similar consequences for the new venture. This venture, in other words, must begin *with* and not without social democracy, a system of thought and organisation which represents a further growth of democracy, as we have known it so far.

Sri Lakshmi Saraswathi

PRESENTLY engaged in the manufacture of different varieties of cotton and synthetic blended yarn for the local as well as export market, Sri Lakshmi Saraswathi Textiles (Arni) (SLST) now plans to set up a new spinning unit in Tamil Nadu with a complement of 6,048 spindles. The company also plans to invest up to Rs 2 crore in Sri Tripurasundari Hotels (STH) which has a technical tie-up with Southern Pacific Hotels, Australia. STH which has been promoted by the promoters of SLST is setting up a three-star hotel with 129 rooms and other need-based facilities in Madras. To part finance the above projects as also to meet its long-term working capital requirements, SLST plans to tap the capital market with a public issue of 16,66,000 equity shares of Rs 10 each at a premium of Rs 30 per share. The issue which will open for subscription on May 20 will be lead managed by IFCI and Indian Overseas Bank. The new spinning unit will have no gestation period as trial production has already commenced and full level production is expected to be achieved in June this year.

Lanco Ferro

Lanco Ferro is setting up a mini blast furnace of 210 cu mtr working volume and associated systems for the manufacture of 90,000 mtpa foundry grade pig iron. The furnace will utilise imported coke of 12 per cent ash content and iron ore from the mines of National Mineral Development Corporation while the MBF technology is to be provided by Tata Korf Engineering Services. The project which is being set up at a total outlay of Rs 54 crore is expected to commence commercial production by July this year. To part finance the project the company plans to tap the capital market on May 23 with a public issue of 90,00,000 equity shares of Rs 10 each at par. Asian Finance and Investment Corporation which has been promoted by Asian Development Bank will have a 10.2 per cent stake in the company's Rs 22.85 crore post-issue equity capital.

Janak Turbo Dynamics

Janak Turbo Dynamics is setting up a project for manufacturing 1,200 turbine blade disc assemblies per annum at a total cost of Rs 11.7 crore. In addition to finding applications in a number of industrial units like fertilisers, cement, chemical units, etc, these turbines find extensive use in thermal and hydel power generators. The company initially plans to concentrate on manufacturing turbine blades for the Indian railways. Dresser Rand (Worthington and Terry) Steam Turbine, USA, will supply technical information and design/process know-how through its local collaborator V K Sankhala and Associates, Indore, which will also provide the plant and machinery. To part finance the project the company plans to tap the capital market on May 17 with a public issue of equity shares of Rs 10 at par aggregating Rs 7 crore.

Priya Dyes and Chemicals

Promoted by the Priya group which is headed by A K Bhuwania, Priya Dyes and Chemicals (PDC) is presently engaged in exporting dyestuffs, pigments, dyestuff intermediates, naphthols, fast bases, bulk drugs and other fine chemicals which it procures from various indigenous manufacturers in the small-scale sector. The company proposes to acquire office premises and leasing warehouse facilities and plans to set up a quality control laboratory for quality testing of its product range. Estimated to cost Rs 6 crore the project is to be part financed through a public issue of 10 lakh equity shares of Rs 10 each at a premium of Rs 40 per share. Even after the public issue which opens for subscription on May 16 the promoters' stake in total equity capital will stand at 66.7 per cent.

Malhotra Steel Industries

Promoted by G D Malhotra and his sons, Malhotra Steel Industries is engaged in the manufacture of rolled mild steel products like CTD bars, angels, etc. The company now plans to increase its rolling capacity from 66,400 tpa to 1,48,000 tpa in addition to setting up a backward integration project for manufacturing ingots with a capacity of 53,745 tpa. The project which is estimated to cost Rs 12.3 crore is to be financed through equity capital of Rs 4 crore, share premium of Rs 6 crore, term loans of Rs 2 crore from State Bank of India and internal accruals of Rs 44 lakh. To part finance the project the company plans to tap the capital market on May 16 with a public issue of equity shares of Rs 10 each at a premium of Rs 15 per share aggregating Rs 7.8 crore.

Pithampur Steels

Pithampur Steels, which has been promoted by Radheshyam Maheshwari and Mahesh Chokse, presently manufactures MS structurals. The company plans to enter the capital market with a public issue of equity shares at par on May 16 to finance its expansion-cum-modernisation plans. It plans to expand its capacity from the present 15,000 mtpa to 28,000 mtpa in addition to modernising its unit at a total cost of Rs 3.6 crore which will be fully financed through equity capital. The company's products which find application in machine parts, furniture, automobiles, channel gates, RCC construction work, industrial sheds, dams, agricultural machinery, windows, etc, are to be marketed through the company's own existing marketing network. Commercial production on the expanded capacity is expected to commence this month.

Prakash Solvent Extractions

Incorporated in 1991, Prakash Solvent Extractions is setting up a solvent extraction plant to produce 30,000 mtpa of castor oil and rice bran oil from de-oiled cakes. The project which is estimated to cost Rs 3.35 crore is to be financed through equity capital of Rs 3.4 crore, cash subsidy of Rs 15 lakh and term loan from Syndicate Bank to the tune of Rs 30 lakh. The company will procure the major raw material, namely, castor oil cakes, rice bran oil cakes and hexanes from the local market. The company's products which find wide application in industries like soap, lubrication, paints, surface coating, perfumery, etc, will be marketed through the company's existing marketing network. To part finance its project the company plans to enter the capital market with a public issue of equity shares of Rs 10 each at par on May 16.

Gujarat NRE Coke

Originally incorporated in 1986 under the name Madhusudan Traders for carrying on the business of trading and investment in shares and securities, the company changed its name to the present one to reflect its future plans. Gujarat NRE Coke plans to set up a one lakh tpa plant for the manufacture of low-ash metallurgical coke at a total cost of Rs 10.6 crore. To part finance the project the company plans to tap the capital market on May 16 with a public issue of 8.8 lakh equity shares of Rs 10 each at par and 13 lakh 17 per cent partly convertible debentures (PCDs) aggregating Rs 3.3 crore. Part A of Rs 10 of each PCD of Rs 25 will be converted into one equity share of Rs 10 at par while part B of Rs 15 will be the non-convertible part. As against the price of imported coke (with an ash content of around 12 per cent) which stands at Rs 4,700 the company plans to market its product at a price of Rs 4,000 per mt. Commercial production is expected to commence by July this year.

CURRENT STATISTICS

***EPW* Research Foundation**

Industrial growth is showing an unusually divergent pattern with signs of deceleration emerging in such areas as infrastructure industries that had shown reasonably decent growth earlier. Food industries are also showing absolute declines over the year. But the automobile and man made fibre industries have registered an acceleration in growth. The equity prices have shown continued downtrend in recent weeks following the ban on badla trading, lack of support from FIIs and cancellation of VSNL Euro issue. M3 growth is continuing at high levels but reserve money growth has been arrested due to a drastic reduction in RBI credit to the centre. The increase in WPI has reached 11.2 per cent on an annual basis which is to a great extent contributed by the prices of food items.

HINDALCO

Self-Sufficiency in Power

THE merger of Renusagar Power Co with Hindalco from April 1992 is expected to result in a larger company with stronger reserves and assets and the financial results of the latter for 1992-93 include those of the former. An Aditya Birla group company and a giant in the aluminium industry, Hindalco improved over its performance in 1992-93. The company's net sales rose by 15.4 per cent to Rs 755 crore while operating profit rose by 35.5 per cent. Gross and net profits rose by 34.3 per cent and 31.2 per cent respectively. The company also raised the dividend rate from 37.5 per cent to 40 per cent. While production of calcined alumina rose from 2,93,079 mt to 3,05,300 mt, production of metal fell from 1,66,197 mt to 1,63,485 mt due to reduced availability of power as a result of poor quality of coal supplied and shutdown of unit 4 at the Renusagar power plant following breakage of the turbine rotor blade. Production of rolled products fell from 31,529 mt to 29,619 mt while that of extrusions fell from 10,385 mt to 9,799 mt due to fall in demand in the consuming sectors, namely, transport, automobile and building construction. Inadequacy of funds with the State Electricity Boards led to poor offtake of EC grade metal. The high burden of excise duty on aluminium has also contributed to the demand recession for the metal. Despite very low prices on the London Metal Exchange, the company's exports on the other hand rose by more than 200 per cent to a record 20,433 mt of primary aluminium and semi-fabricated products as against only 7,281 mt last year.

During the year the company revalued land and buildings and major items of plant and machinery and a sum of Rs 910.4 crore (including revaluation of the Renusagar power plant assets) arising on revaluation was transferred to capital reserves.

In order to consolidate its premier status in the domestic market the company has undertaken major expansion and modernisation schemes which are to be implemented over the next three to four years. With a view to becoming self-sufficient in its requirements of alumina at current levels of production the company plans to increase its alumina production capacity from 3,00,000 mtpa to 3,50,000 mtpa by December 1993 by installing balancing equipment and removing bottlenecks. In order to help generate electricity and enable the use of exhaust steam in the alumina plant process it also proposes to install a back-pressure turbine for co-generation of power. The smelter capacity is also to be raised by 40,000 mtpa to 2,10,000 mtpa by installing a power efficient potline based on updated technology and inhouse research. In addition, two power generating units of 70/74 mw each are to be installed in phases at Renusagar which will make the company self-sufficient in terms of power requirement on the expanded smelter capacity and enable it to supply some power to the state/national grid. In order to enlarge its product mix and enable the marketing of hi-tech products as also increase its export of rolled products the company plans to install a new and modern cold rolling mill which is expected to be commissioned by August 1994.

The company's first euro issue aggregating $ 108 million which was floated in July 1993 was closed in three days. The issue which was lead managed by Robert Fleming and Co and co-managed by Bear Stearns consisted of 44,73,000 units, each consisting of one share and one half of a warrant, each warrant being convertible into a Hindalco global depository receipt (GDR) after 90 days. Hindalco is planning another $100 million euro issue.

The reduction in excise duty on aluminium in the 1993-94 budget to 25 per cent *ad valorem* has been passed on completely to customers. However, aluminium products still continue to bear a high incidence of duty as compared to substitute materials.

For the first six months of 1993-94 the company earned a net profit of Rs 54.6 crore on net sales of Rs 310.3 crore as compared to a net profit of Rs 60.2 crore on net sales of Rs 363.3 crore in the corresponding period last year.

ADVANI OERLIKON

Modernisation Programme

A pioneer in the field of welding technology, Advani Oerlikon is engaged in the manufacture of industrial electronics and power control equipment in addition to a wide range of electrodes, flexes and flux cored wires. The company's technical and financial collaborator, Oerlikon-Welding of Switzerland, is a world leader in welding and has a 7.7 per cent stake in the company's equity.

The year 1992-93 saw the company consolidate its past performance with a 15 per cent and 129 per cent rise in net sales and net profit respectively. This was despite an 84 per cent rise in tax provision. A sharp increase in profitability helped the company raise the dividend rate from 20 per cent to 30 per cent.

The company's exports saw a 20 per cent jump over the previous year. The company is the largest exporter of welded products from India and has established a joint venture in Malaysia for manufacturing welding consumables. In order to concentrate on the export front the company has commissioned a 100 per cent export-oriented unit for welding consumables in Sewree. The company has also undertaken major modernisation and upgradation programmes at all its manufacturing units for which it entered the capital market with a rights issue of equity shares at a premium of Rs 15 per share in January this year. The issue aggregating Rs 8.8 crore offered one equity share for every two held by the shareholder and has led to an increase in the company's equity capital from Rs 7 crore to Rs 10.5 crore. The extensive modernisation programme which is to be implemented over the next three years is estimated to cost Rs 30 crore. The company's application-oriented research centre has recently developed five new important electrodes.

Three of the company's subsidiaries, namely, Ador-Cooperheat, Advanced Welding Alloys and Ador-Samia have performed well for 1992-93. Semiconductors, the fourth subsidiary, is awaiting directions from the BIFR regarding the rehabilitation proposal submitted by the workers' union.

For the six months ended September 1993 the company earned a net profit of Rs 7.9 crore on net sale of Rs 168 crore as compared to a net profit of Rs 5.2 crore on net sales of Rs 169.7 crore for the whole of 1992-93.

KIRLOSKAR BROTHERS

Focus on Core Area

This Kirloskar group company was severely hit by the low demand for compressors and machine tools in 1992-93. Though the company managed to improve net sales by 16.8 per cent over the previous year, a sharp increase in input costs and other operational costs could not be passed on to the customer and operating profit fell by 3.6 per cent. However, gross profit and net profit rose by 43.4 per cent and 190 per cent mainly due to a large non-operating income, a major part of which was contributed by capital receipt of Rs 13.1 crore from Copeland Corporation of the US for giving up the compressor business and for non-competing with similar business of Kirloskar Copeland which is a recently established joint venture in co-operation with Copeland Corporation. The company has since transferred its hermetic compressor division to Kirloskar Copeland in which it holds a 51 per cent stake as compared to the 49 per cent stake of Copeland Corporation. The pumps and valves business of the company showed slight improvement during the year under review. The hermetic compressor factory of the company at Karad has become the only compressor factory in the country to have secured an ISO 9001 certificate.

The company's exports rose by 74 per cent over the previous year to Rs 17.3 crore with the company completing its biggest export order which was obtained from Egypt. With this the company has exported more than 90,000 pumpsets to Egypt in the last 20 years. The construction of a factory for the manufacture 4" submersible pumps

in collaboration with Ebara Italia at Shindewadi in Pune undertaken by the company has been completed. Efforts are also on to acquire a large tract of land for Kirloskar Silk Industries.

The company plans to focus on its core competency, namely, fluid handling, in future and in line with this strategy it vacated its publishing business in 1986 87 and more recently exited from its hermetic compressor business. The mulberry plantation undertaken by it on a pilot scale has reportedly shaped up quite well and the company is searching for a suitable piece of land. The company has recently bagged an order for three offshore fire water pump packages from L&T for its platforms for ONGC, against stiff competition from American and Indian companies. The company's vertical turbine pump involved in the package will have a suspension length of about 30 metres and is built with special materials which are suitable for sea water.

For the first six months of 1993-94 though the company's net sales rose to Rs 101.8 crore, net profit fell to Rs 50 lakh.

COROMANDEL FERTILISERS

Dim Outlook

The disturbance in the industry caused by the decontrol of phosphatic and complex fertilisers coupled with the decanalisation of imported diammonium phosphate (DAP) and the consequent cut in selling prices due to the dumping of DAP in the domestic market led to severe pressure on the company's margins. The company was forced to reduce its prices to very low levels in order to be entitled to the one-time *ad hoc* subsidy scheme of the government of Andhra Pradesh. The scheme, introduced in the company's primary marketing territory, provided for a price concession of Rs 609 per tonne for urea-ammonium-phosphate 28:28:0 grade, the company's main product.

The discontinuance of subsidies for nitrogenous fertilisers and large-scale dumping in the domestic market led to a sharp fall in sales in 1993-94. Sale of the company's 'Gromor' products fell from 3,79,000 mt last year to 3,16,000 mt. Further, inventory levels continued to rise with the percentage of inventory to net sales rising from 11 per cent to 33 per cent. With subsidy dues rising to about Rs 60 crore there was significant increase in working capital. High interest rates on the one hand and a synchronous increase in working capital due to escalation of costs, reduced sales and increased inventory resulted in interest charges rising sharply by 38.5 per cent over the previous year. With depreciation also increasing sharply by 19 per cent, profit before tax fell by a phenomenal 90 per cent. Even a 99 per cent fall in tax provision for the year could not stop net profit from plummeting by 82 per cent

The power restrictions and failure of certain equipment especially in the ammonia/sulphuric acid plant adversely affected operations and production of fertilisers fell from 3,86,607 mt last year to 3,76,689 mt. Further the plant had to operate at lower loads due to the lead in the ammonia converter cartridge which is a critical equipment in the ammonia plant. The low demand forced the company to extend the turnaround of the plant for a period of about 75 days.

The replacement of the ammonia converter cartridge is expected to improve the operational efficiency of the ammonia and urea plants. The company has spent a substantial amount on the sulphuric acid and complex plant debottlenecking projects and also taken steps to conserve energy. These measures are expected to yield Rs 1.6 crore per annum. The company also plans to replace the kellogg converter basket in the ammonia plant with a higher capacity ammonia-casale converter basket and the gas-cooler in the sulphuric acid plant with economisers. Installation of HT Quench system in the ammonia plant is also on the cards. These additional energy conservation plans are expected to result in a savings of Rs 3.2 crore per annum.

The reduction in urea prices on the one hand and the rise in prices of phosphatic fertiliser due to decontrol on the other has led to a shift in preference of farmers to nitrogenous fertilisers. The introduction of the *ad hoc* subsidy scheme in the rabi season in 1992-93 and again in both the seasons of the subsequent year has led to downward pressure on prices of phosphatic fertilisers and the company is pessimistic concerning its performance in 1993-94.

For the first six months of 1993-94 the company suffered a net loss of Rs 9.3 crore on net sales of Rs 128.6 crore.

SURYA ROSHNI

CFL Joint Venture

High interest and depreciation charges have taken their toll on the bottomline of Surya Roshni (formerly Prakash Tubes) for the year 1992-93. The company's net sales were higher by 24.3 per cent over that in 1991-92 and operating profit rose by 19 per cent during the same period. The steel tubes division in Haryana produced 41,947 mt of pipes/tubes and 11,919 mt of cold rolled strips as compared to 39,569 mt of pipes/tubes and 6,792 mt of cold rolled strips in the previous year. Despite stiff competition after the decontrol of steel the division claims to have maintained its grip on the market. The division also supplied pipes conforming to various Indian and international standards including API for sophisticated and specialised use to its customers in addition to completing projects for the manufacture of cold rolled coils and strips and larger dia pipes.

The company exported steel pipes worth Rs 1.9 crore (including export incentives) during the year under review. Its two lighting units in Kashipur, Uttar Pradesh, and Malanpur, Madhya Pradesh, saw a 14 per cent rise in turnover over the previous year. However, margins were under pressure due to the substantial increase in cost of LPG, furnace oil, electricity and interest charges.

During the year projects worth Rs 30 crore, including the new factory at Malanpur which were completed in the previous year, were stabilised. Further, the projects of tungsten wire drawing, molybdenum wire drawing, GLS filament and balancing equipment at Kashipur and the expansion in capacity of the GLS lamp and fluorescent tube lamps (FTL) at Malanpur involving Rs 8 crore were completed. Projects worth Rs 45 crore comprising Halogen Lamp H-3, H-4 and MR16 series at Malanpur and a new factory of lead glass and the expansion in the capacity of GLS lamps, GLS filaments and FTL filament at Kashipur were expected to be completed by March this year. The various projects implemented were expected to have a favourable impact on the performance of the company in 1993-94.

To part finance its project the company entered the capital market with a rights issue of 16 per cent partly convertible debentures (PCDs) of Rs in the ratio of one PCD for every five equity shares held. Part A of Rs 40 of each PCD was converted into one equity share of Rs 10 at a premium of Rs 30. With the conversion the equity capital of the company rose by Rs 11 crore.

The company plans to set up a joint venture with Osram GmbH for the manufacture of energy-efficient compact fluorescent and other lamps. Osram GmbH is one of the three largest lamp manufacturers in the world and plans to concentrate its activities in India on manufacturing compact fluorescent and other innovative lamps.

For the six months ended September 1993 the company earned a net profit of Rs 3.5 crore on net sales of Rs 89.6 crore.

FINOLEX CABLES

Bonus Issue

Finolex Cables is the first electrical, power and telecommunication multi-product cable company with multi-location of plants to be awarded the ISO-9002/IS-14002 certificate for its factories at Pimpri and Urse. Encouraged by its performance for the year ended March 1994, Finolex Cables has declared a 1:1 bonus (the third bonus issue in the last six years). Though turnover increased marginally due to the lower excise rates and also lower copper prices leading to corresponding price reduction, profit before tax and profit after tax were higher by 6.3 per cent and 5.2 per cent respectively. In addition to the bonus issue the company has declared a divided of 55 per cent for the year. During the year there was an all round increase in production with production of jelly filled telephone cables going up from 13 lckm by over 28 per cent to 17 lckm and that of light duty and power cables recording an increase of about 14 per cent over the previous year.

Triple Talaq Judgment

Do Women Really Benefit?

Flavia Agnes

The Allahabad High Court's judgment regarding triple 'talaq' creates the erroneous impression that it safeguards the rights of Muslim women. In fact, the judgment weakens their position by validating the discriminatory aspects of the Land Ceiling Act.

THE Allahabad High Court's judgment has raised yet another controversy regarding Muslim person law. The reactions are varied. The Muslim orthodoxy and the Muslim Personal Law Board have criticised it on the ground that it violates the constitutional provisions for minorities under Articles 25-28. Secular forums and some Muslim women's organisations have welcomed it as a positive step which safeguards women's rights. Islamic legal scholars while condemning the practice of triple talaq and the inertia of the Muslim Personal Law Board to declare such practice as invalid have nevertheless expressed their concern that the judgment might result in hampering the development of reform from within the community. Some scholars have asked whether a retrospective judgment in a land ceiling issue was the proper forum to tackle the grave and sensitive issue of validity of triple talaq.

But there is hardly any discussion on the effect of this judgment on the woman concerned and her rights to property, and also about the precedence it has created in the realm of marriage relations and women's right to property and matrimonial home. The publicity creates an erroneous impression that the high court has upheld a Muslim woman's petition challenging the triple talaq and in the process safeguarded the rights of Muslim women. It is in this context that certain clarifications regarding the case are necessary.

The UP Imposition of Ceiling on Land Holding (Amendment) Act was passed in 1972. Under this act in the year 1974, notice was issued to Rahmatullah in respect of excess land in his possession. In November Rahmatullah filed his objections stating that the land which belonged to his wife, whom he had divorced in 1969, had been erroneously and illegally included as his land. In 1980 Khatoon Nisa stated before the authority that she had been divorced by her husband 11 years ago.

Overriding the objections, in August 1982 an order was passed holding the land to be surplus land. Rahmatullah and Khatoon Nisa filed separate appeals against the order. In August 1984, the appeal was admitted, the order of the 'prescribed authority' was set aside and the case was remitted for fresh trial to ascertain whether Rahmatullah and Khatoon Nisa were divorced according to law or whether the plea of divorce was raised only to save the land from the Land Ceiling Act.

In 1986, after fresh trial, the prescribed authority reconfirmed its order. Again, both Rahmatullah and Khatoon Nisa filed appeals. In April 1993 the additional commissioner, Faizabad, dismissed both the appeals and held that since there had not been a divorce or a judicial separation through a court order between Rahmatullah and Khatoon Nisa, their income could be clubbed together. The talaqnama and evidence of Khatoon Nisa's father and other witnesses were held to be not sufficient proof of divorce. The court held that since the names of the parties appeared in the same voter's list and since they lived in the same house and village, this was sufficient proof that the couple was not divorced.

The controversial judgment was passed in the matter of two writ petitions filed by Rahmatullah and Khatoon Nisa against the above order. The issue before the court was whether an orally divorced wife is qualified for the benefits available under the act to a judicially separated or divorced wife. On April 15, 1994 justice Hari Nath Tilhari of Lucknow bench of Allahabad High Court held that a customary divorce, either under the Shariat Law or under the Hindu Marriage Act, is not a valid divorce if it violates the provisions of the Constitution, and since triple talaq is discriminatory against women, such a divorce is not valid. The effect of the judgment is that the woman who had been divorced 25 years ago is held to be married even against her own depositions before the state authorities. Further, the judgment held that since she is not legally divorced, she and her husband are not entitled for exemption granted to a couple who are divorced or separated through a court order, and hence their land can be acquired by the state under the Land Ceiling Act.

The judgment has grave adverse implications for the woman concerned. At one level, Khatoon Nisa is divorced by her husband according to a valid form of divorce under the provisions of the Applications of Shariat Act of 1937, and as a consequence under the provisions of the Muslim Women's (Protection of Rights on Divorce) Act of 1986 she is not entitled to maintenance. At another level, she is deemed to be married for the purposes of Land Ceiling Act and will lose her right to the land which at present stands in her name.

The court has held triple talaq as invalid. But would the situation of a Muslim woman be any different if she is not divorced in one sitting but in three consecutive sittings? What is even more crucial for women is that once they are divorced under the Muslim Women's Act, they lose their right to maintenance. And no court in the country has declared the Muslim Women's Act as unconstitutional and granted divorced women right to maintenance.

The judgment has also other implications for women. Khatoon Nisa herself has pleaded in all court proceedings that she has been divorced. Since all laws permit a divorce by consent of the parties, even assuming that the divorce was to gain certain economic benefits, can a court hold such a divorce as invalid when a woman herself has not challenged it? When parties to a marriage have a right to voluntarily enter into a marriage contract, can the state have the power to compel them to remain married just because it is to the advantage of the state? The judgment provides the state with the authority to interfere with the most intimate aspects of people's life against the wishes of the parties concerned.

The Bombay High Court had given a ruling in a case of similar nature. In a petition for divorce by mutual consent, the family court, Bombay, refused to grant the couple a decree of divorce on the ground that the dissolution of marriage was sought with an ulterior motive of saving the property from prospective creditors and held that the petition was an eye-wash as there were no real differences between the parties. The family court had reached this conclusion in spite of the fact that the parties had appeared before the court voluntarily and had deposed that they had mutually agreed upon divorce. The high court set aside the judgment of the family court and expressed surprise as to how the trial judge had arrived at the conclusion that the divorce was an eye-wash, when all the legal requirements for a valid divorce had been complied with.[1]

When laws are framed, the specificity of minority communities is ignored. The Land Ceiling Act exempts women who are divorced or temporarily separated through a court order. The concept of judicial separation is not recognised under Muslim law. So, while concessions are made to Hindu women whose law recognises the concept of temporary separation, no concessions are made to communities whose personal law recognises customary forms of divorce. A Muslim man has no other recourse to divorce than the customary provisions under the application of Shariat Act.

The only point of dispute seems to be whether it is to be done in one sitting or in three consecutive months. All the debate has centred around this point. One fails to understand how a woman's situation will improve even if she is divorced through a process of three pronouncements in three months. What is far more relevant to women is that both law and custom recognise her right to be maintained even after divorce, and her belongings and 'mehr' is returned to her promptly, and she is not dispossessed from her matrimonial home when she is divorced.

The Family Courts Act is another example of how specificity of minorities is overlooked when legislations are framed. The family courts were meant to provide speedy, informal and inexpensive forums to settle matrimonial disputes. But in Bombay their jurisdiction is limited to Hindus and those married under Special Marriages Act. The jurisdiction over matrimonial disputes of minorities is retained with the high court where the procedures are expensive and far more technical. This has resulted in an increasing number of women turning to qazis and maulvis for an amicable settlement under the customary form.

While holding such divorces as invalid, the state has not made any provisions for quick redressal within formal court procedures. The situation for a Muslim woman in Bombay today is that she has to approach the family court for maintenance under Section 125 of Cr PC while her marriage is subsisting. If she also wants a divorce, she has to file under the Dissolution of Muslim Marriages Act in the high court. As soon as she obtains a decree of divorce, her right to maintenance under Section 125 Cr PC is forfeited. At the end of it, in order to claim her belongings, mehr and maintenance during 'iddat' period, she has to approach the magistrate's court under the Protection of Muslim's Act. All this under the state-enacted legislations which claim to uphold the dignity of Muslim women.

The issue of validity of triple talaq was not challenged by the woman concerned in her writ petition. The opposing party was not her husband but the state authorities. It is pertinent to note that not just the advocates of Khatoon Nisa and Rahmatullah and the *amicus curae* assisting the court, but even the advocate general appearing for the state had pointed out to the judge that since the issue of triple talaq had not been challenged, the judge had no authority to decide this issue. Perhaps it needs to be pointed out that the advocate general, Bhatnagar, who represented the state is not a Muslim. In fact, Bhatnagar had to pay a heavy price. The Avadh bar association passed a resolution to suspend the advocate general for his comments against the judgment.[2]

While the Allahabad judgment has held triple talaq as unconstitutional in a matter where constitutional validity of the issue was not even challenged, in several cases where constitutional validity of discriminatory personal laws was challenged the court had either skirted the issue or upheld the discriminatory provisions.

In 1983, the Andhra Pradesh High Court had held that the provision of Restitution of Conjugal Rights (Section 9 of the Hindu Marriage Act) as unconstitutional as it violated the right to privacy guaranteed by Article 21 of the Constitution.[3] But subsequently the Delhi High Court diverged from this judgment and held that the provision serves a useful purpose of reconciliation. It is interesting to note the comments of the judge: "Introduction of constitutional law in the home is most inappropriate. It is like pushing a bull into a China shop. It will prove to be a ruthless destroyer of the marriage institution and all that it stands for. In the privacy of the home and the married life neither Article 21 nor Article 14 has any place."[4] Subsequently, the Supreme Court upheld this judgment and overruled the Andhra Pradesh judgment.[5]

The Allahabad judgment also assumes it an essential requirement that the couple should have a separate residence. In fact, our demand today is that a woman should have a right to reside in her matrimonial home. Most women are claiming their right to reside in the matrimonial home along with their petition for divorce. What would be the implications of this judgment for such petitions?

The press has compared this judgment to the judgment in Shahbano's case. The comparison is limited only to its discussion of Islam and Muslim personal law. But while Shahbano had herself approached a court for reliefs and had gained personally from the judgment, Khatoon Nisa has been deprived of her land.

The judgment does not question the discriminatory aspects of the Land Ceiling Act. The practice of clubbing a woman's property and treating it as the property of the man is detrimental to women's rights. The assumption is based on the premise that husband and wife are one unit and this unit is of a permanent nature. After the property is acquired, if the couple are divorced, will the couple be entitled to reclaim their property from the state? The act also provides two additional hectares of land for each adult son but no such benefits are provided for adult daughters. The act presumes that either women are not capable of owning property or property is of no concern to adult females. With his preoccupation with the position of rights of women under personal law, the judge has failed to examine the discriminatory aspects of the Land Ceiling Act.

IISCO Privatisation: The Real Issue

A K Roy

The real issue in the privatisation of IISCO is not economic or technical, but political and so has to be faced politically as part of our struggle for economic independence against the neo-colonial assault in the new unipolar world

THE proposed privatisation of the Indian Iron and Steel Company (IISCO) has become a matter of public controversy This Burnpur-based historic iron and steel complex in West Bengal came to the public sector after becoming sick in private hands It is now to be handed over to a private party again As per the decision of the government, the management of this concern will be entrusted to the Bombay based company, Mukand However, the bill brought forward in the Lok Sabha in the last session to give legal shape to this proposal had to be withdrawn after facing stiff opposition and is now under consideration before a standing committee The ruling Congress(I) has an absolute majority in the house and so withdrawing a bill at the introduction stage is something unprecedented suggesting a division in the party itself The labour wing of the Congress(I), the INTUC has raised the banner of revolt on this issue In the countrywide strike in the public sector steel companies on September 7, 1993, officers lent their support to the workers, though normally the two tread opposite paths All these developments raise doubts whether the IISCO privatisation move is really in the interests of the nation

In 1975 when the goal of self-reliance was at least kept on paper, the target of steel production by 2000 AD was shown as 100 mn tons in a white paper In the 80s after the appearance of the IMF, the target came down to 35-40 mn tons Now in the 90s we are to be satisfied with production of 22-25 mn tons No new steel plant is coming up in the Eighth Five Year Plan and the emphasis of modernisation of the existing plants is on curtailment of manpower and not on increasing production There is much noise about over-staffing of the public sector steel industry (2 25 lakh employees) and excessive cost of production, though wages and salaries constitute only 13 per cent of the production cost, the rest being raw materials (29 4 per cent), stores and spares (21 per cent) depreciation (12 per cent) maintenance (9 5 per cent), fuel (8 4 per cent) and interest (6 5 per cent) Many would be surprised to know that American steel is costlier than Indian By exporting 30 mn tons of good quality iron ore to Japan, India gets Rs 600 crore which could be obtained by exporting only 1 5 mn tons of steel So to remain an exporter of iron ore rather than of steel is against our national interest

All these only add to our apprehension whether the plan for IISCO privatisation has come as a move to throttle the future of the Indian steel industry as a whole specially in view of the many unanswerable parts in that plan IISCO like TISCO is a complete industrial complex with its steel factory, iron ore mines, colleges colonies offices, even airstrips spread over at least three states West Bengal Bihar and Orissa Its production capacity is 1 2 mn tons of hot metal (crude iron from the blast furnace) but in 1992 93 production was 0 86 mn tons yielding 0 428 mn tons of pig iron and 0 398 mn tons of steel even with two of its four blast furnaces damaged and not repaired On March 3, 1993 there were 32 414 persons on the rolls 19 563 in the steel factory On February 14 1972 when IISCO was taken over there was a solid assurance in parliament given by the then steel minister Mohan Kumaramangalam that this historic concern would never be handed over to any private party, that its incorporation in SAIL was irreversible and that the plant would be renovated increasing its capacity to 2 5 mn tons Kumaramangalam is dead and so apparently is his promise

It is well known that economic production of steel requires optimum use of capacity and low consumption of coke and energy The old and long neglected IISCO was behind in all these respects While to produce one ton of hot metal the coke required (coke rate) is 0 644 ton in Bokaro, 0 682 ton in Bhilai, 0 70 ton in Rourkela, 0 716 ton in TISCO and 0 856 ton in Durgapur, for IISCO it is 1 027 In foreign countries the figure is much less—Japan 0 485, US 0 525 and UK 0 557 The high coke rate in India is mainly due to the high ash content of Indian coke of between 18 and 22 per cent, while that outside is only 7 to 8 per cent Similarly, while in foreign countries the energy consumption per ton of steel is 4-5 giga calories, the average in India is 9 giga calories and that in IISCO is above 12 giga calories Reducing the coke rate by 10 kg reduces the cost of production of steel by Rs 19 per ton If the coke rate of IISCO is brought at par with TISCO there would be a saving of Rs 600 per ton and Rs 50 crore per year, i e, IISCO would show a net profit of Rs 20 crore after wiping off the present loss

So there is no dispute about the need for modernisation of IISCO In 1988-89 the government also decided to raise its capacity to 2 5 mn tons and a memorandum of understanding (MOU) was signed and Rs 200 crore spent on repairing and renovating some parts of the plant creating great enthusiasm among the workers which enabled cash losses to be eliminated in two successive years However controversies started on who would do what how it would be done (and who would pocket the commissions!) First it was decided to hand over the job to a Japanese consortium which would scrap the whole old plant and replace it with a new one on a turnkey basis As there was no role for indigenous technology it was not liked by the Janata Dal government headed by V P Singh Then Dastur and Co stepped in giving a compromise scheme replacing some parts and retaining the rest In both cases the cost envisaged was Rs 6 000 7 000 crore and the time span 6 7 years Many other exercises were carried out but curiously SAIL was bypassed though IISCO belonged to SAIL and SAIL with its design and planning organisation MECON was best suited to handle the job as is being demanded by the trade unions today and as has been proposed by the consultative committee of parliament on the steel ministry only recently

The V P Singh ministry fell without taking a decision on IISCO modernisation and the Narasimha Rao government launched its new economic policy championing the cause of privatisation So the earlier MOU was cancelled and it was decided to handover the entire Rs 15 000 crore worth property of IISCO to the Bombay based scrap melter company (mini steel plant) Mukand reviving memories of the Dalla episode in UP

Apart from the fact that both MEACON and Dastur have held Mukand s proposal to be defective and unpractical the people are wondering whether this is the beginning of the end of the Rs 1 36 000 crore public sector The only reason for privatisation given by the government is the lack of funds, the other alternative being going to the BIFR It is true that the Planning Commission has reduced the demands of the steel ministry from Rs 24,000 crore to Rs 14,000 crore (SAIL s Rs 19 500 crore to Rs 12,000 crore) and now SAIL is to proceed with its Rs 6 500 crore modernisation from its internal resources only But it is also true that the modernisation of the Bhilai Durgapur and Rourkela steel plants, each costing Rs 4 000 5 000 crore is at the final stage and Bokaro modernisation would cost only Rs 1 625 crore So soon SAIL would be left with no major jobs What will its design and construction experts and

workers be doing? Would MEACON go the Hindustan Steel Construction (HSCL) way? What is more the annual turnover of SAIL is around Rs 12,000 crore while that of Mukand is Rs 600 crore So if the latter could manage to raise funds of Rs 3 500 crore for modernisation of IISCO why not SAIL? If the funds are to be raised from the market or taken from banks, why should SAIL lag behind?

Many steel experts have proposed a strategy of phased modernisation of IISCO According to one such plan, there would be a Phase I programme involving Rs 400 crore for revamping the boilers, the power plant and other critical equipment to get one million tons of hot metal Phase II would cost Rs 1 500 crore to provide LD converters oxygen plants extra captive power to yield 1 5 mn tons of hot metal There would be a Phase III, with a similar investment, for setting up raw material yards a sinter plant and additional blast furnaces to produce 1 5 mn tons of steel and 0 6 mn tons of pig iron Mukand would also follow a phased programme spending practically nothing in the first two years

What is surprising is that the proposal for privatisation of a premier steel plant has come when Indian steel has attained maturity to compete in the world steel market and the public sector has demonstrated better performance than the private sector in steel marketing There is a recession in the world steel market and world production which was 786 mn tons in 1989 came down to 733 mn tons in 1991 Steel factories are retrenching workers on a large scale in the US, UK, Germany and even Japan The US has already levied an anti-dumping tax of 48 2 per cent on some types of Indian alloy steel to save its sagging markets, while dumping the Indian market with stainless steel at exceptionally low prices taking advantage of the lowering of customs duty from 170 per cent to 85 per cent The onslaught would be more this year with customs duty further lowered to 65 per cent, threatening to make our alloy steel plants sick and then pushing them to privatisation if the first test with IISCO proves successful But even in the midst of such an unfriendly situation and despite all the corruption and waste, our public sector steel industry is showing improved performance Capacity utilisation, which was below 70 per cent in the 70s and around 80 per cent in the 80s, now exceeds 95 per cent SAIL has yielded profits for the last nine years continuously In 1992-93 when TISCO's profit got reduced from Rs 214 56 crore to Rs 127 17 crore, SAIL's profit increased from Rs 365 72 crore to Rs 423 30 crore In 1993-94 also SAIL's production rose but not overall production of steel in the country which was around 15 mn tons much below the target of 17 4 mn tons, as the mini steel plants in the primary sector, contributing 35 per cent of production, were affected by the global and domestic recession According to a recent report out of 178 mini steel plants in the country 73 are lying closed rendering more than 10 000 persons jobless Instead of managing a major steel plant like IISCO why not Mukand be entrusted with managing some of the other mini steel plants in the country? Moreover, what are Mukand's special qualifications except that it has a collaboration arrangement with a Netherlands based concern, Hoogovens? People ask how a scrap melting company which has never handled an integrated steel plant be entrusted with the modernisation of IISCO and with raising its production to over 2 mn tons

There is no convincing reason, economic or technical, for privatisation of IISCO and definitely not for handing it over to Mukand. This will serve only the interests of the west which wants that India should remain an iron ore exporter and a steel importer If this year's budget is any indication with the increase of excise duty and lowering of customs duty on steel products, the whole of SAIL may go the IISCO way and then slowly TISCO would also follow The IISCO-to-TISCO cycle would then be complete for the Indian steel industry So the issue is not economic or technical but intensely political and so has to be faced politically as a part of our struggle for economic independence against the neo colonial assault in the new unipolar world

PUNJAB

NHRC and Human Rights Violation

Sucha Singh Gill

In view of the advisory nature of the national human rights commission and the unhelpful attitude of the state and central administration the commission may not be able to fulfil the task expected of it

WITH the installation of the Congress(I) government in Punjab in February 1992, led by Beant Singh, the chief minister, the militancy began to be controlled at a fast pace and most of the terrorist cadres and leaders within the country either have been killed in police 'encounters' or have been arrested Consequently, terrorist guns have nearly been silenced almost for a year or so But the extraordinary powers given to the police and security forces remain with them even now Similarly, a large number of draconian laws led by the notorious TADA have also not been withdrawn The psyche of the security forces of being at war with the terrorists and hence being in a privileged position to use and abuse the law in the larger interest of securing and sustaining peace in the state has brought forward several cases of brazen violation of human rights of people in the region in the post-terrorist violence phase There are many such reported cases where even elected representatives in the state assembly, even those from the treasury benches, are helpless before the police force The failure of political process to check police excesses has led some affected persons to knock at the door of the courts and opposition leaders and the democratic rights activists have sought the help of journalists to highlight such cases in the press

The intervention of the Supreme Court saved a lawyer couple from illegal harassment One of the lawyers is a daughter of a former deputy commissioner of Hoshiarpur district who was getting married crossing caste and religious barriers against the wishes of her father The Punjab and Haryana High Court intervened recently to restrain the SSP of the Ludhiana district who was trying to settle personal old scores with an influential businessman family of the city Sensational press exposure of the police killing of a lawyer family at Ropar and of a young boy of Valtoha (Amritsar) led to handing over the cases to CBI for investigation The concerned police officials, threatened with arrest, had to secure pre-arrest bail from the courts The high court also intervened in the case of women whose foreheads were allegedly tattooed 'jebkatris' (pickpockets) by the police Apart from these well known cases, several other such cases have been reported in the vernacular press, and have been highlighted by human and democratic rights activists and leaders of the opposition parties

The growing number of cases of human rights violation by the police being brought to the courts and several others being reported by the press, in the face of the claims by the state government that militancy has been completely curbed, prompted National Human Rights Commission to visit Punjab and Chandigarh from April 16 to 20, 1994 The commission team consisted of five members headed by R N Mishra, the retired

chief justice of India. The state government and the ruling Congress(I) attempted to create an impression that there was no violation of human rights by the police in the state. Their effort was to impress upon the commission that the only source of such violation were the terrorists who have been silenced, and that all is well in the state. Initially, they allowed to meet the commission only those individuals and delegations who held opinion similar to that of the ruling party. The government did not publicise the visit of the commission to the state in advance lest many complaints should come forward. The commission reportedly took serious note of this fact. But with the publication of the news that the commission will be holding its sittings at Chandigarh, Ludhiana, Jalandhar and Amritsar for one day at each place, a large number of individuals and delegations came forward to lodge their complaints.

The commission could get evidence of human rights violation during its first sitting itself at Chandigarh on April 18. A woman, whose seven relatives, including a two-year old child, were taken away by the police and were not traceable, was illegally detained by the police when she tried to appear before the commission. Ultimately, the case came to the notice of the commission and the chairman of the commission R N Mishra had to intervene to get her released from the illegal police custody. In another case, the day the commission arrived at Chandigarh on April 17 a group of drunkard policemen, during late hours, reached a dhaba at Zirakpur, a small town situated on Rajpura-Chandigarh road, in a police gypsy. They went on rampage, beat up the workers, the owner and some customers present at dhaba, damaged the furniture and threw away the eatables. They also kidnapped three persons, including the dhaba owner, "to teach them a lesson". They were irritated that on an earlier occasion these policemen and their guests were not attended to properly (free of cost) by the owner. The report of this incident was flashed by a local English daily on the day of the first sitting of the commission at Chandigarh.

The Ludhiana sitting of the commission must have been an eye-opener for the members of the commission. One Sat Paul Gosain, who wanted to produce before the commission two girls who had been allegedly raped by policemen, was not allowed to do so by Congressmen and the district administration. He ultimately raised slogans against the commission and could manage to meet the chairman in the committee room when the sitting of the commission had wound up. Gosain learnt later on that the commission had not refused to meet him. It was at the same time that Tarsem Jodhan and Vijay Sathi, CPM and Janata Dal MLAs, respectively, reached the committee room, followed by Congress (I) men including some councillors of the municipal corporation. There was a heated exchange of words for sometime. During the day-long sitting of the commission, delegations and complainants were not freely allowed to meet it. They were stopped by the police and were asked to first meet the political secretary of the chief minister to ascertain what they wanted to talk to the commission. In the case of inconvenient delegations, they were not at all allowed to see the commission.

There was a disturbance during the sitting of the commission when a delegation led by CPM Kisan Sabha state president was lodging a complaint relating to alleged beating of CPM MLA Tarsem Jodhan. A group of Congressmen and some liquor contractors tried to disrupt the proceedings of the commission. It was on the intervention of the commission members that the Congressmen were made to leave the room and the CPM delegation was able to speak to the members about their complaint related to the beating up of the party MLA by the political secretary of the chief minister in the circuit house at Ludhiana on April 17. Janata Dal MLA, Vijay Sathi, told the reporters that he was prevented by Congressmen from meeting the commission and was asked to meet first the political secretary of the chief minister. He also disclosed that several other persons were given the same treatment and were not allowed to present their complaints to the commission.

A large number of individuals and delegations of common people, other than those of political parties, could also not meet the commission due to the interference by the police. The commission had fixed its sittings in 'circuit houses' of the state at Chandigarh, Ludhiana, Amritsar and Jalandhar cities. The police converted these circuit houses into fortresses under the pretext of providing security to the members of the commission and created many hurdles for non-party individuals and delegations. Knowing that many such persons would complain against the police, the latter did not allow them to come near the commission.

As there were a large number of persons who wanted to present their complaints and express their grievances personally, the commission did not have time to meet all of them. A large number of persons came forward to tell the commission the story of their woe and brazen violation of their human rights. They made serious efforts to file their complaint with the commission. A woman from Sangrur district could not meet the commission at Chandigarh and Ludhiana, and was finally successful in doing so at Amritsar. Finding their effort going waste, people unitedly raised their voice through slogan-shouting and attracted the attention of the commission at Amritsar. The chairman and other members of the commission then addressed the people and asked them to submit their complaints in writing at Amritsar or at Delhi as it was not possible to meet every one due to paucity of time. An assurance was given to the gathering that the complaint of every one would be attended to and the aggrieved parties would be replied or given an appointment to see the commission.

A majority of the complaints filed related to police excesses. There were a large number of cases of individuals 'missing' after their arrest by the police. Their relatives complained that they had been killed in police custody through excessive torture or in fake police encounters. The cases of harassment of women, custodial rapes and harassment of children and political opponents were brought before the commission. Some complainants also brought to light specific cases of kidnappings, extortions and land grabbing by the members of the police force. The Akali delegations raised their voice for the hundreds of TADA detainees, without any regular cases, for the last five to seven years, and occupation of houses of killed militant leaders by the police and their conversion into police posts. The police was accused of helping influential Congress leaders to grab private property and capture power in panchayat elections by not allowing opponents to file nominations.

Another set of complaints was related to the apathy of the state government and non-fulfilment of specific commitments. A large number of women whose policemen relatives were killed in fight against militancy had not been given announced benefits including government job to the next relative. Similarly, several women complained that families who had been victims of the terrorists had yet to get announced compensation.

Several delegations complained that extra legal powers given to police to deal with the terrorists continue to be with them in spite of the end of the terrorist violence. They stressed that in view of the gross misuse of these powers, they need to be withdrawn immediately and guilty police officials need to be punished. It was also stressed that the district police be brought under the civil administration of district.

People who dared to present their complaints, risking hostility of powerful police officials, expect concrete action on their complaints from the commission. At the same time, they expect protection from possible retaliation by the police officials. For this purpose each case has to be investigated independently by the investigation team of the commission which has not as yet been set up. It was stated by the chair-

man of the commission that such a team is in the process of being set up. If the commission proves to be helpful in giving relief to the victims of human rights violation, its credibility will be established in the eyes of the common man. The least the commission can do is to immediately direct the state government to restrain the police, withdraw extra legal powers given to them and bring them under the control of civil administration. This assumes importance in view of the opinion of the chairman of the commission which he expressed when the chief minister met him. The chairman has been quoted as having said that, "with the normalisation of the situation in the state, the commission would like to see the police returning to normal policing". But in due course the commission must become instrumental in getting punished the violators of human rights, whatever their social or political status may be.

This will help in restoring confidence of human and democratic rights organisations in the state. The co-operation between the commission and these organisations can go a long way in checking violation of human rights by the state machinery entrusted with the task of enforcing the rule of law. Any lapse on this count will further shake the confidence of the people in the working of the institutions in the country. In view of the advisory nature of the commission and the past attitude of the state and the central administration, the expected task appears to be quite daunting.

BIHAR

New Dynamics of Agricultural Workers' Struggle

Mukul

Agricultural workers in Madhapur block of Madhubani district of Bihar are successfully organising themselves to demand minimum wages from landowners.

"SINCE July-August 1993, the Mushhar agricultural labourers of the village are facing the wrath of total boycott by the landowners. We were getting only 1.5 kg paddy husk for a day-long work. But when we organised ourselves, demanded a little more and called for a bandh, the landowners retaliated like this"—so narrates Rameshwar Sadai, an agricultural labourer of Hashauli village in Madhapur block of Madhubani district, revealing a new, unfolding situation in various villages of northern Bihar. Not only Hashauli, but other villages in the same block, too, like Nandanvan, Navlakha, Vindeshwar, Mushhari, Kheri, Khashyam, Rahuwa Sagrani, Bheja Fakirana, are witnessing for the first time a major dispute over payment of minimum wages to agricultural labourers.

Behind this issue lies a deep socio-political polarisation, which is taking place in the remote rural hinterland of Bihar. On the one hand, even the most downtrodden castes, like Mushhar, are organising themselves together with the agricultural labourers of other backward castes, like Mandal and Yadav. On the other hand, the landowners, who are all from forward castes, are not ready to accept this and are conspiring to crush the labourers.

Thus, in the months of January and February 1994, many Mushhar labourers received anonymous, threatening letters. Nasiblal Sadai reads one such letter: "Now the last time has arrived. This is our final statement. Bloody holi will take place. You have reached your last stage".

Though it all started in Madhapur with the formation of Lok Shakti Sangathan, a mass organisation working primarily among the Mushhars, the socio-political scenario dominated by Laloo Yadav regime seems to be a constant reference point for the contending parties. The Mushhars, Mallahas, Yadavs and Mandals feel a sense of security and hope, even though the state government has not done anything to enforce the Minimum Wages Act or to resolve the conflict. And the forward caste landowners hold the Laloo Yadav government to be primarily responsible for creating these types of disturbances.

Hashauli is a remote Mushhar village, almost 4 km away from any road or regular transport. All the 50 families of the village are totally landless, and dependent on agricultural work, available in Bhagwanpur village. This village is dominated by the forward caste landowners who own vast amount of agricultural land in the area. Only one adult Mushhar is skilled in carpet weaving and has recently come back from Varanasi. The male workers do the main agricultural work, like ploughing, sowing, harvesting, and the female workers do the supplementary work, like carrying the crop load, taking care of crop, cleaning the field, etc.

These Mushhar families are one of the worst victims of socio-economic exploitation in the rural set-up of Bihar. Deprived of land and other productive resources, they are at the mercy of landowners for their day to day survival. Their poverty and helplessness is strengthened by beliefs such as that Mushhars in Bihar eat rats and snakes to feed themselves. Hashauli village is a typical example of Mushhars' plight, where they are continuously being denied even the minimum legal and democratic rights. In 1978 and 1981, altogether 24 Mushhar families were given 'pattas' of land, but they are not in a position to take possession of that land even today. The common and government land in the village is under the control of landowners. Kaushalya Devi and other women complain that they have been beaten up and humiliated a number of times by the landowners. The villagers allege that the landowners murdered one, young, Jhamalo Yadav who tried to organise the Mushhars and other backward communities in the 80s.

The payment of minimum wages to the agricultural workers is the most burning issue today in Hashauli. The Bihar government has fixed the daily minimum wage of agricultural labourers as Rs 24.50. But in Hashauli, the Mushhars are getting 1.5 kg paddy husk, wheat or maize for a day-long work, which comes to Rs five to eight. No other benefits are being given.

Deepak Bharti, convenor Lok Shakti Sangathan, explains the issue in Jhanjharpur: "The conditions of an agricultural labourer are pathetic, since he is getting such meagre wages since the last 10 to 15 years. But we have not demanded the government wage rate and are only asking for a daily wage of 3 kg paddy husk, wheat or maize. This will only cost Rs 12 to 15. The rationale for this demand comes from the specific situation of the area. Every year floods come in the area and destroy most of the crop. Thus the landowners are also suffering. In this situation there should be a workable rate of minimum wage by which agricultural labourers can survive and landowners can also continue."

The landowners are not ready to accept this workable rate and complain about carelessness, lethargy and limited working hours of agricultural labourers. Chandrakant Jha, mukhia of Bhagwanpur village, says: "We are not going to give 3 kg wage. We cannot bear this burden, and above all, the Mushhar workers are working for very few hours. They are not delivering the goods. Their ways of demanding higher wages are also not acceptable to us, as they have suddenly decided on it and are now asking us to implement it."

Hashauli and the surrounding villages are in a constant state of tension and trauma since July 1993. When the Sangathan asked for an increase in the minimum wages and threatened with a bandh only, the landowners aggressively decided on a total boycott of local labourers. The landowners are now hiring labourers from outside and in

their desperate need are even paying 3 kg wages to them. The labourers are being threatened in many ways and the landowners are imposing various restrictions to break their struggle. The cattle belonging to Mushhars are not allowed to go in the open fields and lands of landowners. They are not allowed to use some of the common ways which pass near the houses of landowners. The use of tanks and wells is also being heavily restricted. Some stray, violent incidents have taken place between the landowners and agricultural labourers, but they were controlled within a short span of time.

The Mushhar agricultural workers and their Lok Shakti Sangathan have successfully organised protest during the last nine months. Facing a boycott from landowners is really difficult but the labourers are continuing with their struggle and sometimes they go out to find some casual work.

Hashauli has also initiated similar protests in nearby Mushhar villages. Though the degree of protest is limited in other villages up till now, it is just the beginning. The most significant development lies in the fact that the agricultural labourers from the nearby villages are not working in the fields of Bhagwanpur. In some cases, they are actively joining the protest of Mushhar labourers. Even the Yadav and Mallaha agricultural labourers of Bhagwanpur village have refused to work in the fields of landowners. Kheli, the mukhia of Bhagwanpur Mallaha 'toli' and Dhyani Yadav, the mukhia of Yadav toli jointly assert: "We are not working. We will not work until the demands of Mushhars of Hashauli are settled."

The emergence of organisations like Lok Shakti Sangathan, the rising aspirations of the most downtrodden castes like Mushhar and the coming together of persons Kheli Mallaha, Dhyani Yadav and Surya Narayan Sadai are some of the notable dynamics in Bihar today.

ANDHRA PRADESH

Rising Son

M Shatrugna

The chief minister of Andhra Pradesh is attempting to use the Kurnool by-election to project his son, Surya Prakash Reddy, into the political arena.

THE Kurnool Lok Sabha by-election, scheduled towards the end of May, is likely to witness one of the most fierce electoral battles between the Congress(I) and the Telugu Desam in the state. Money, muscle power, rampant misuse of official machinery, following the trend set in Nandyal by the ruling party, would mark the by-election.

As expected, the Congress(I) nominee for the by-poll is Surya Prakash Reddy, son of the chief minister. Though his name came up for 'consideration' several times, after the election of Kotla from Panyam assembly seat, the chief minister vehemently denied every time that his son would be the Congress(I) nominee. Not only that. To give a modicum of legitimacy and 'popular' backing to Surya, an AICC team headed by Janardhan Poojari and A K Antony visited the state 'seeking' the 'opinion' of the partymen and legislators on the nomination. The moment the team had left Hyderabad, Surya's candidature was announced giving credence to the dissident's charge that the exercise was only a formality. The AICC observers seeking the opinion of the partymen itself was a big joke. Gate crashing, jostling, exchange of abuse between warring factions and downright rowdyism, which have been the standard Congress(I) meeting preliminaries, marked the observers' visit. Various factions in the party led by the supporters of former chief minister Jalagam Vengal Rao, former union minister P Shiv Shanker, Tamil Nadu governor Marri Chenna Reddy, 'BCs' group led by the former minister K E Krishna Murthy who had defected to the Congress(I) before the 1989 poll from the TDP, 'gave' their opinion backed by hundreds of their vociferous followers. Added to this comic opera was the group led by the former chief minister N Janardhan Reddy, presently unemployed after his sack two years ago. Not to be left alone, even Bhuvanam Venkatram (Reddy), who cannot even win his own seat in any assembly constitutency in the state, had made a beeline to meet the AICC observers.

The chief minister marshalled the services of his ministers led by K Rosiah. Muscle and lung power was provided by his lieutenant minister P Janardhan Reddy and Youth Congress president Sudhakar Reddy. Surya Prakash Reddy, whose only qualification is that he is the son of the chief minister, has no political background whatsoever. As expected, he filed his nomination papers followed by a host of ministers, MLAs and partymen. His supporters came from all castes, ranging from the landowning Reddy community to the SCs, the multicaste alliance mirroring the present-day electoral politics. They managed to ensure the presence of even a Muslim minister.

Compared to Congress(I), the TDP show of strength was moderate and more sober. S V Subba Reddy, the vice-president of the state TDP, is the official nominee. The TDP nomination ritual was led by the general secretary Nara Chandra Babu Naidu who was followed by a score of legislators and MPs. In addition to their own folk, the TDP managed to get the attendance of CPI(M) MP Bhim Reddy Narasimha Reddy and a CPI leader of Kurnool. In contrast, the BJP, the so-called third independent front, was nowhere in the picture.

Kurnool district has a chequered history. Till the end of the 18th century it was under the rule of the Nizam of Hyderabad. During that period the British and the French alternated their military troops in the service of the Nizam. In 1800, the Nizam, both as a gesture of gratitude and as a 'compensation', granted the area south of Tungabhadra river to the British. The four 'ceded' districts were Bellary, Cuddapah, Kurnool and Anantapur. All the four districts have considerable Muslim population. Kurnool assembly segment itself has substantial number of Muslims. In the 1989 assembly polls, the TDP Front had allotted the seat to the CPI(M). The Front candidate M A Gafoor had polled about 43,000 votes and the winning Congress(I) candidate 57,000 votes. Kurnool Lok Sabha constituency has a million electorate with two lakh Muslim voters. Since 1971, barring the 1984 mid-term poll, the seat was always won by the Congress(I). Of the six elections held since then, Kotla contested four times and had won thrice. Even during the 1984 poll he lost by a narrow margin. The constituency has seven assembly segments with two SC reserved seats. In the 1967 polls, the seat was won by Damodaram Sanjivayya, the first and the only scheduled caste chief minister of the state. In the latest state polls held in 1989 the TDP could bag only one of the seven seats. In the 1991 Lok Sabha polls, Vijaya Bhaskar Reddy polled about three lakh votes, 50,000 more than the TDP candidate S V Subba Reddy, the present contestant. At that time, the BJP candidate had polled about 20,000 votes and the rejected votes were a massive 16,000.

With 16 per cent SC population in the district, two SC reserved assembly segments and a substantial Muslim electorate, and with the BJP out of the contest and the post-Ayodhya developments, it will not be an easy task for the Congress(I) to retain the seat. Specifically, much depends on the mood of the minorities and the dalits.

The political outcome of the election will have a significant impact on the state assembly elections, scheduled six months away. While retaining the seat may not be a major political gain for the Congress(I), any creditable performance by the TDP at the polls will help it to consolidate its presence in the Rayalaseema region for the ensuing assembly elections.

Designing Wood-Fired Cooking Stoves

Where is the Woman?

Mangala Subramaniam

The 'appropriateness' of a technology is to a large extent measured by how well it satisfies the needs of the client in the case of the cooking stoves of the rural woman. Such an assessment of the needs and priorities of the rural woman in respect of wood-fired cooking stoves is severely lacking.

ACCELERATING deforestation in much of the third world has been adversely affecting fragile soils causing increased pollution and also resulting in negative effect on all life on earth. The loss of forests has been attributed to pressures from growing populations, land-hungry small farmers and rural households in search of fuelwood and forage. There has at the same time been a tremendous response and concern expressed over the issue. The principal causes of deforestation have been spelt out as the three symptoms of population growth and poverty—shifting cultivation, agricultural conversion and fuelwood gathering. In addition, commercial exploitation including logging and land clearing for ranches and agricultural estates have also been identified as causes for loss of forests.

Studies indicate that nearly half of the world's present population live in areas of acute fuelwood scarcity or deficit. Extrapolations indicate that up to three billion people will be living in such areas by the year 2000 [Manibog 1984]. India alone faces an extraordinary challenge: the population is expected to touch 1 000 million by the end of the century. Thus India's demand for food, firewood, fodder and building materials (like timber) and various such products will grow by leaps and bounds [Agarwal 1989]. Between 1950 and 1983 forest and woodland areas dropped 38 per cent in Central America and 24 per cent in Africa. Deforestation rates are estimated to be extremely high in countries such as Niger, Ivory Coast, Paraguay, Haiti and El Salvador, and others such as Indonesia, Brazil and Colombia that have large forest areas are also losing vast tracts.

Many governments and aid donors have stepped in to address the problem and much of the effort has been concentrated on the supply side: tree planting projects. Demand management activities have been lacking and attempts at promoting improved energy efficient stoves are still in the infant stages. However, whether it is the tree planting schemes or the development and dissemination of improved models of cooking stoves, involvement of the local population has been side-stepped.

The government of India first articulated a forest policy in 1952 which was only a modified version of the policy statement made earlier during British rule. According to the act the government has the right to charge levy on timber and forest produce in government and other forests. The Forest Policy 1988 gives higher priority to environmental stability than to earning revenue and prefers mixed forests. But it wishes to curtail the rights and concessions of forest dwellers by relating them to the carrying capacity of forests. The new policy read together with the Forest Conservation Act implies that the government intends having exclusive rights to management and ownership over both non reserve and reserve forest lands. Unfortunately, laws enacted by the central government have not been effective in either checking encroachment onto forest areas for fuelwood purposes, nor in checking private contractors who are working for the timber based industries. The effectiveness of policy both to create and protect forests and regulate its use has a direct relationship to woodfuel availability and use. The government has, no doubt, realised that legislation passed to protect forest areas in and of itself, is not sufficient to ensure that woodfuel energy requirements are met and that deforestation is adequately controlled. Therefore, the central and state governments have become involved in several reforestation programmes as also other means to minimise/optimise the use of woodfuel. Demand management activities are lacking and attempts at introducing and promoting use of improved models of wood fired cooking stoves, on a large scale, have not been successful.

Improved Cooking Stoves

Efforts have been made to design and disseminate improved models of cooking stoves in many countries like Guatemala, India, Kenya, Nepal, Sri Lanka and West Africa. Improved cooking stoves have been looked upon as an important tool for reducing fuelwood consumption (and conserving energy), as also improving the health of women. A major advantage could be better or complete cooking of food and therefore better nutrition for the members of the household. In Guatemala, many different forms of the Lorena stove are in use—round, rectangular, square, L or T shape. There were about 20 stove programmes in which the first level included laboratory tests and field trials in controlled dwellings. Estimates made indicated that national stove coverage had reached 0 7 per cent of families (this is around 1982) [Caceres 1983].

The cook stove or 'jiko' industry in Kenya is well-established and has been developed by small-scale entrepreneurs responding to local community needs and based on availability of materials. The 'jiko' is made from scrap metal. The proximity of jiko makers to the users partly explains the low price of the jiko, which has been fairly stable, rising from $ 0 5-1 0 in 1960 to only $ 1 20-3 0 in 1983. Several government and non-government programmes have been under implementation. The 'kimaki' jiko project that was initiated in 1981 aimed at developing construction techniques for a multi-fuel metal stove. Kimyanjui (1983), however, points out that lack of continuous training led to the manufacture of poor quality stoves. The 'umeme' stove that was developed, under the UNICEF project in Kenya, was more complex to use than the traditional one. In this model, the pot sits inside the stove rather than resting on the top. Larger pots can be placed on the top of the stove, but then the fuel efficiency is reduced. The cost of the 'umeme' stove is high, but the selling prices are low because of the arrangements made by UNICEF to procure materials from large companies at lower rates. However, once this is withdrawn the price of the stove may not be within the reach of the users [Hyman 1986]. An interesting aspect of the Kenyan programme is the active involvement of the non-governmental organisations and the ministry.

In Sri Lanka, improved models of stoves were designed under the Sarvodaya stove project. The Lorena stove (popular in Guatemala) was initially introduced as it compared with the traditional Sri Lankan stove. The estimated capital cost for the stove was $ 5 each. Later, a modified clay stove was developed which was quicker and easier to build. Quality problems, however, arose with this model and the material could not withstand high temperatures resulting in the cracking of the stove. Subsequently, in 1981, the 'Tungku Lowon' stove from Indonesia was adopted. The materials used for construction were sand, clay, cowdung and ash and this proved stronger than the previous model. However the $ 2 00 cost of the thin metal chimney made it unsuitable for mass dissemination. The most popular model was the pottery liner stove which costed only $ 1 00 each and the construction of nearly all these stoves was technically correct. Dissemination of the stove was taken up in Kandy district and studies have shown that 78 5 per cent of the users preferred this model to the traditional stove [Navaratna 1983]. Portable metal stoves costing about $ 3 00 each are being widely used in West Africa. This improved stove is being manu-

factured and distributed in Burkina Faso, Mali, and Niger. Studies have indicated a 30 to 33 per cent savings in fuel on an average. The sales of this model was reportedly low because the 'giveaway' programme had deterred potential users from purchasing the stoves [Baldwin 1984].

In the 1930s, Gandhian organisations in India developed stoves with chimneys, with an intention of reducing the indoor smoke pollution [OTA 1992]. This was followed by the HERL model, developed in the 1950s, which however was found to provide no fuel savings. There was only a marginal reduction in the indoor smoke levels in this model. Following this, attempts were also made by other developing countries but the models were found to contribute to little or no fuel savings This has been attributed mainly to the material used for construction—sand-clay mixtures [Baldwin 1984]. Researchers at the Indian Institute of Science's Centre for Application of Science and Technology to Rural Areas (ASTRA) in Karnataka developed an alternative to the traditional claystove the three pan model called the ASTRA-OLE. The improved version, developed in 1983, had one of the highest recorded efficiencies and provided a 40 per cent reduction in the cooking time [Baldwin 1984]. A single pan stove with a similar level of efficiency was also developed at ASTRA around 1985 [Goldemberg et al 1987]. ASTRA-OLE is similar in design to the Lorena stove and main field trials and dissemination were first undertaken in the Ungra region of Tumkur district (southern Karnataka) [Somasekhara 1984]. The cost of the three pan stove, made of sand clay, was \$ 7.00 (\$ 1 = Rs 10.00 in 1984) which proved to be a disincentive for purchase. The state government intervened and the stoves were made available at a subsidised rate [Baldwin 1984]. In spite of the above, in a study conducted in the North Kanara district of the state of Karnataka , Nadkarni (1989) points out that though the use of fuel efficient 'chulhas' designed by ASTRA have been canvassed for quite some time, the traditional 'chulhas' dominate even though they are not fuel efficient. The reasons for the non-use of the improved fuel-efficient model has however not been elaborated upon.

The 'addupu' model developed by the Kerala Sastra Sahitya Parishad (a voluntary organisation responsible for the almost 100 per cent literacy in the state of Kerala) in Kerala is reported to have an efficiency of almost 30 per cent [Somasekhara 1985]. The actual performance of the stove and its acceptance by users is not well known. The 'Nada' chulha was developed in the villages around Chandigarh, under a programme of the Ford Foundation. About 98 such chulhas had been built in the villages near Chandigarh as at the end of 1983. The only cost for this model was for the chimneys and dampers. The asbestos cement pipes (about three inches in length) for the chimneys cost about \$ 2.50, while if made of tin by local tin smiths, it is \$ 3.20 [Sarin 1984]. The involvement of women users for the development and construction of the stoves has to some measure contributed to the success of the model [Agarwal 1986].

Work in this area has also been initiated in two more states of north India—Himachal Pradesh and Uttar Pradesh—by the Delhi-based development alternatives. Four designs were developed, based on a market survey that was undertaken to determine cooking practices, fuel consumption, availability of present stove designs and other economic and social parameters. Each of the designs had a provision for secondary air to ensure maximum combustion of wood with a high content of volatiles. The models are both one-pot and two-pot stoves made from fired clay or metal. The costs of the various models vary from \$ 1 50-\$ 7.50 All designs can and should be covered with mud plaster of approximately 2 cm thickness for both thermal insulation and safety. Field tests had been proposed to be conducted before final dissemination [Khosla 1984] The agency has followed a systematic procedure to arrive at alternative models—the market survey, it is assumed, covered a significant number of users in the two states.

Research and development efforts at the Gujarat Energy Development Agency (GEDA) at Vadodara, Gujarat state, have been directed towards use of mud, pottery lining, mild steel, cast iron and stainless steel as raw materials Under the National Programme on Improved Chulas, of the government, both portable metal chulas and fixed mud clay chulas are being promoted. Fixed stoves are constructed in the kitchens of different households and provided to beneficiaries for a token contribution The metal chulas are sold at subsidised rates ranging from 50 per cent (for beneficiaries in the general category) to 75 per cent (for scheduled caste and scheduled tribe beneficiaries) of the cost of the stove. At current prices, the improved mud chula costs about Rs 50 depending upon whether it is a single pot or double pot model, while the traditional chulas cost about Rs 10-15 each. The user has however to pay only Rs 15 for the improved model; of which Rs 5 goes towards the cost of the material and Rs 10 to the 'mistri' (the persons who does the construction). In addition, GEDA offers these self-employed workers, an honorarium of Rs 10 per chula for its repair and maintenance for a year. The cost of ceramic chulas range between Rs 120 and Rs 180 depending upon the size [Gandhi 1991].

There is thus ample evidence of the stress laid by many countries to develop appropriate models of cooking stoves and ensure their acceptance. The 'big' gap is that there is absolutely no mention of the felt needs of the user—the rural woman It can clearly be observed that in almost all cases the field tests conducted consequent to dissemination give no indication of the sample size of the survey as also whether the improved model is continuing to be used. Gill (1987) has in her analyses of the reasons for the 'failure' of improved models of stoves, cited that the priorities of the villagers may be different from those of the promoters. The monitoring of the stove programmes has generally been on the numbers disseminated rather than a determination of the effects and impacts in relation to the expected benefits.

In fact, it is the end users consideration of stove cost; sturdiness, quality of construction, life expectancy, visual appeal; and ease of operating, regulating, extinguishing, cleaning and maintaining that will determine stove design acceptability and usage. Agarwal (1986) rightly states that the available evidence strongly points to the unsuitability of a 'top-down' approach and 'straight-transfer' approach for the diffusion of wood stoves; and to the importance of field adaptation involving the local users, local materials and local artisans. To this extent, Sarin (1984), who was involved in the development of the 'Nada' chula mentions that the experience of working with village women has demonstrated the importance of making technology suited to varying needs. Being more explicit—specific criteria should be adopted for the generation of new designs and user needs must be the question to be answered before setting out on the improvement of the existing or traditional model [Howes 1983; Foley 1984]. A list of evaluation factors for development of programmes on improved wood-burning stoves has been provided by Islam (1984). The 'user and use factors' has been categorised as a part of the pre-project evaluation of existing stoves, which in turn is followed by other categories within 'research and development' While the study in specific pertains to Bangladesh, the major factors listed are applicable for any such programmes embarked upon

Prasad (1983) has pointed out that traditionally stoves were constructed on the basis of intuition and with experience have modified gradually However, such processes have been slow and to take care of rapidly deteriorating resource situations, more formal approaches are capable of yielding quicker results This also explains, with illustrations, that in the recent past, there have been examples of transplanting stove designs from one community to another but sufficient care has not been taken in the process

Stoves have been designed with emphasis on being smokeless or more fuel-efficient but the users may have in fact looked upon smoke as a means of keeping away pests and mosquitoes In addition, fuel efficiency is significantly linked with the way, the stove

is used and women may definitely look at reduced time for cooking as a major factor to influence its adoption. Gandhi (1992) in connection with the GEDA experiment argues that laboratory testing and design development often do not take into consideration environmental conditions or the multiple cooking needs of the family. The 'most efficient' cooking stove may not provide these outputs efficiently, although it might use less fuel for the cooking operation alone. Gandhi (1992) thus states that women's knowledge of stove design and construction must be taken into account and for which a survey of traditional cooking practices would be required. Such a survey, should ascertain the socio-cultural criteria to be met and should also include other parameters like diet, cooking styles as also the kind of fuel being used. Islam (1984) has elaborated on similar details after a study in Bangladesh.

In sum, there are a large number of designs in the 'market' and all of them are put together by intuition rather than perceptible engineering analyses backed by reliable data. The caution must be in the adoption of technologies that are appropriate to local conditions, so that they do not lead to undesirable consequences. The factors to be considered for designing of stoves, essentially include the social factors or considerations, the engineering considerations, and the development and ecological considerations. The social factors and the development and ecological considerations are segments that are location and country specific. Several studies now show that a considerable part of the intransigence exhibited by the consumers in not accepting the newer designs should be attributed to the simple reason that the designs do not meet their needs.

Underlying these various initiatives, however are a variety of fundamental issues that must first be addressed for the development of better/optimal designs leading further to appropriate programme formulation for dissemination and thus increased adoption of the improved models. These fundamental issues include identification of user needs as also the affordable price. The prices at which the new models are made available is also crucial, considering that the traditional models used in rural households generally do not involve any investment. It, then becomes necessary to question the success or failure of new designs or improvements on traditional stoves and its non adoption. Are these designs and improvements being introduced without assessing the needs and priorities of the 'consumers', in this case the rural population or to be specific the woman? It is plausible that interest and initiative is lacking since it is the woman who cooks and it is the man who brings in earnings. In view of the existing social system in India, there is every possibility that no attention is paid to this aspect; since cooking is associated with the woman and any form of assessment or even consulting the woman will be only a secondary concern.

The government of India as also the state governments, have launched programmes for designing improved models of cooking stoves. It is learnt that the department of non-conventional energy sources, is carrying out work with the assistance of academic institutions to design suitable models. Efforts are also being directed by other non-governmental agencies. The question then is. Why has the acceptance levels been so low and the impact almost negligible? This is especially significant considering that women have been active supporters for preserving forest wealth. Women are actively involved in both the 'Chipko' and 'Appiko' movement (launched by the youth of Sirsi taluk, of north Kanara district, who were moved by the destruction of essential ecological processes and in which women became active participants); which is a strong indicator of the level of awareness of forest wealth and the need for preservation. In fact, the receding forest line, has increased the drudgery of the rural woman who has to walk longer distances to collect fuelwood. This implies that women users, if involved could provide crucial inputs for the programmes. Unfortunately, this has not been so and complete success has eluded most programmes.

By time-honoured tradition, the finalisation of the system of formulating and administering programmes, has been behind 'closed' doors. This is true not only of the programmes related to improved models of cooking stoves but also of the numerous poverty alleviation and family welfare programmes—all of which have evolved without field level specificity. Such 'sophisticated' development will prove expensive for the rural family leading the government to return to its accustomed practice of 'subsidising'—for which the government will have to earmark revenue and which will in a way cause either the buyer to attach no value to the item or the seller to have no incentive to cut down costs. Thus, every year begins the dilemma of either continuing the subsidy or withdrawing it. It must be pointed out here that the withdrawal of the subsidy would entail the decision-maker to be dubbed 'anti-poor' or 'anti-development'. In addition, large outlays and investments for implementation of programmes through the government machinery is not likely to yield results.

Efforts are worth being directed to involving the NGOs, which are established and have strong links at the grass roots level. It must however be cautioned, that the credentials of the NGOs identified should be examined carefully to ensure results. Actions to create awareness will in a way, provoke the rural populace to seek improvements or new facilities and programmes. Participation and programme impact are bound to be positive, when the need arises or is coaxed to arise from the rural masses/ from within. Attention thus needs to be drawn to careful planning and formulating programmes involving local women. Women are key agents to change and inputs from them are vital for the success of the stove programmes.

IMF's Shock Therapy and Russia

R G Gidadhubli

At a seminar in Washington in February, the managing director of the IMF sought to defend the Fund's prescription of so-called 'shock therapy' to bring about the successful economic transformation of the former USSR and other countries of eastern Europe. How convincing were his arguments?

MICHEL CAMDESSUS, managing director of the International Monetary Fund (IMF), while addressing a seminar in February on 'Implications of Western Policies for the Economic Recovery of Eastern and Central Europe' made an attempt to defend 'shock therapy'. He presumably considered it necessary to do so in reply to severe criticism of the policy prescriptions of the IMF which had been put in the dock.

Shock therapy as an important policy instrument for the economic transformation of the former socialist countries of erstwhile USSR and eastern Europe has been a subject of intense debate and controversy among academics and policy-makers not only in these countries but outside, particularly in the west After the virtual defeat of Russia's Choice, the party led by Egor Gaider, in the December 1993 election, prime minister Viktor Chernomyrdin declared that the era of shock therapy was over In 1993 he had already introduced several measures to undo shock therapy Subsequently, in this February, he reiterated his attack on it (*Moscow News*, No 5, February 1994) stating that the government was not a club where experiments could be conducted when every decision affected the life of millions of people He blamed the shock therapy policy of the Gaider government for pushing the standard of living of 50-60 per cent of the population below poverty line in 1992

Chernomyrdin's view presumably got support in the remarks of the US vice-president, Al Gore, who, on the eve of his visit to Moscow in December 1993, stated that there had been only shock and no therapy in Gaider's economic policy in 1992 Joining the Chernomyrdin chorus, the well known Russian economist, Gavril Popov, opined that it was necessary to clean up the country from the remnants of the shock therapy of Gaider and Feodorov (*Argument i Fakti*, Moscow, February 7, 1994)

In short, the proponents of shock therapy both inside Russia and outside stood discredited This included the IMF whose economists had strongly supported the policy for Russia after the disintegration of the former Soviet Union To make matters worse, what made the position of the IMF unenviable was the other criticism that the free-fall of the Russian economy and its present catastrophic condition could have been avoided if external assistance from international financial agencies such as the IMF had been provided during 1992 and 1993

Camdessus has advanced several arguments in his defence He has given examples of a few former socialist countries which have attempted shock therapy and have achieved fairly satisfactory results For instance, Albania which was in a bad economic situation two years back registered 10 per cent growth in GDP in 1993 which was the highest in Europe Again Poland's GDP growth last year was stated to be the second highest in Europe and, despite several problems facing the country, a growing market economy has been established in four years The Czech republic is another success story where inflation has been brought down to single-digit level and reforms are progressing satisfactorily

He has pointed out that in contrast to the above cases, Russia and Ukraine have been experiencing crisis situations in their economies mainly due to their inability to implement rigorous and comprehensive policies of macro-economic stabilisation and structural reform In his opinion the mistake of Russia and Ukraine was that they have tried to "protect existing patterns of output and employment through subsidies and credits' In the past full employment was achieved as a part of the socialist ideology despite low levels of labour productivity in the country Similarly, a significant portion of output was not realised due to lack of demand or the output was of extremely poor quality and hence was a social waste Under conditions of transition to a market economy this should not have been continued According to IMF chief, Russia and Ukraine have mainly followed a gradualist approach for economic transition rather than shock therapy The implications of this are, first, that it takes long for the transition process to be completed and, second, that it is going to be painful Elaborating this, he pointed out that the result of this gradualist approach will be a high rate of inflation and prolonged recession which means disorder in the economy Such a situation will cause hardship to the population which may be more cruel than the economic effects of shock therapy itself While complimenting Russia for some success achieved in 1992 with regard to price liberalisation, the exchange rate system and privatisation, the IMF chief is candid enough to point out that Russia lacked consistency with regard to fiscal and monetary discipline In this regard he implicitly offers a piece of advice to all the CIS countries in economic transition that they should build a consensus among the people to sustain policies of change But this is not easy in Russia since political pluralism and the democratic forces operating in the post-disintegration period have created pressure groups with vested interests which openly advocate conflicting approaches and policies For instance, in Russia's super parliament there were strong policy differences between president Boris Yeltsin and the prime minister on the one hand and the speaker Ruslan Khasbulatov and vice-president Rutskoi on the other Similarly, there were divergent opinions between finance minister Feodorov and the chief of the Central Bank of Russia, Viktor Gerashchenko, on Russia's monetary policies

Another issue on which the IMF chief expressed his views was external assistance for economic transition This is linked to the earlier issue since there is a view that shock therapy in Russia has not succeeded due to lack of external economic assistance Camdessus does not agree with this First, the west as a whole (both governmental and international agencies including IMF and World Bank taken together) made available over $58 bn to Russia in 1992 and 1993 which could not be considered as negligible The IMF extended economic assistance to several CIS countries Kirgyzia Kazakstan and also Russia During the last two years the IMF provided financial assistance twice under the specially created scheme of systemic transformation facility (STF) to enable Russia to shift to market-based trade Despite the assistance Russia was not able to undertake and implement the necessary fiscal and monetary policies Second, IMF has to abide by the rules of the organisation with regard to the linking of financial assistance by the IMF with the recipient country's policies Third the essence of Camdessus's message is that external assistance, including that from the international financial agencies such as the IMF was to be seen as complementary to and not as a substitute for good domestic policies It can only play a catalytic role in the initial period of economic reforms and its role should not be over emphasised for the success of reforms Similarly the conditionalities of the IMF are not to be treated as constraints for the transition of the recipient country but as guiding principles in the implementation of strong and consistent economic policies In

other words, Camdessus has put the onus for the success of economic transition on the country concerned rather than on external factors or agencies.

The arguments of the IMF chief are not entirely convincing. For instance, intercountry comparisons, say between Russia and Albania, have many limitations. In the case of Russia, radical economic reforms under shock therapy were introduced in early 1992 when Russia was experiencing unprecedented political strain as a result of the break-up of the former Soviet Union. This was not the case with Albania or Poland. Secondly, the problems facing Russia in the task of politico-economic transition are far more complex and formidable considering the size of the country and the diverse ethnic, social and ideological groups working at cross-purposes. Third, the economies of Poland and the Czech republic are much more developed and per capita income in them was much higher than in Russia or Ukraine and hence transition through shock therapy was easier than in Russia. Fourth, Russia and Ukraine have inherited an unbalanced economic structure from the Soviet past in the form of dominant defence and heavy industry and relatively weak consumer goods and agricultural sectors. Fifth, in Russia and in other countries market elements and private sector were far too poorly developed when economic reforms were introduced in contrast to Poland or Hungary, which have made the economic transition much more difficult and painful. Last but not the least, sufficient effort has not been made by the western countries to open up their markets for Russia and other CIS countries to enable them to export their semi-manufactured and manufactured goods and earn hard currencies for facilitating their economic transition and integration with the world economies.

China after Deng

S P Seth

China's polity, dominated by Deng Xiaoping since 1978, is so lacking in legitimate constitutional processes and framework that speculation about its future yields widely varying scenarios.

THE recent improvement in India-China relations is a welcome development. But to romanticise it, as in the 50s, is dangerous. It is important to remember that nothing substantive has been achieved on the border question and that the strategic perspectives of the two continue to diverge.

Besides, there is great uncertainty about China in the post-Deng period. Deng Xiaoping is nearly 90. China's polity, dominated since 1978 by this patriarch, is so lacking in legitimate constitutional processes and framework that doubts about its future are quite natural. As Michel Oksenberg has written, "...the communist revolution did not fundamentally resolve the basic constitutional issues that have plagued China since the eighteenth century: orderly arrangements for succession; national, institutional decision-making processes as opposed to highly personal and factional rule; appropriate division of responsibilities among central, provincial and local levels of government..."

The personality factor in China's polity is so crucial that a recent issue of *The China Quarterly* is exclusively devoted to an examination of Deng Xiaoping's role. According to Michael Yahuda, "It may be regarded as paradoxical, but Deng's very success in presiding over the most successful programme of economic modernisation in the communist world and perhaps in China's history has brought to the fore the problems of modern statehood that his programme was designed to solve..."

He adds, "The policies of reform and the growing regionalisation of the economy have weakened the capacities of the central government, thus raising again questions about the underlying unity of the country". As Gerald Segal says, "...domestic reforms and openness in China is helping create several Chinas, with potentially different foreign policies".

Barber B Conable, Jr, and David M Lampton, who are otherwise upbeat about China in a *Foreign Affairs* article, opine, "...The dilemma China's leaders... face today is that the process of economic reform produces new interest groups, adversely affects traditional groups (like state-enterprise workers) and generally gives rise to increasing demands on the regime". They add, "The convergence of such social, economic and political crises with the leadership succession in Beijing could spell turmoil for China's Communist Party and its people".

In the absence of legitimate channels of political expression and mediation, things in China might get out of control once the supreme leader, Deng Xiaoping, is not around to lend his personal authority to decision-making.

There is, however, another school of thought which cautions against looking at China through the prism of conventional western political values. They argue that the Chinese people value order and stability over and above political reforms and democracy. And this will indeed dictate their preference for an authoritarian but stable political system. Vivienne Shue of Cornell University in the US is a strong proponent of this view.

According to her, the "economic contradictions and social strains" of China's partially-reformed socialist economy have created a political situation in China "that is highly incendiary". She argues, "Precisely for this reason—given the interest of almost all parties concerned to avoid either a quick slip or a gradual slide into chaos—the careful consolidation of a more stable, more authoritarian form of state/bureaucratic capitalism seems a more likely evolutionary option than the emergence of genuine popular democracy and a free-wheeling market economy."

Nicholas Lardy, another China-specialist, has no doubt that "over the long run a competitive market economy must be paired with a pluralistic political system. But authoritative governments in east Asia pursued market driven economic growth for decades without relaxing their hold on political power". In other words, China too has a long way to go before moving towards democracy.

Shue believes that "the weakness of civil society in contemporary China... will likely continue to contribute, in crises to come, to the ease with which the embattled state may put down its opponents in society". To this end, the state in China is likely to reinforce its authority with a heavy dose of patriotism. Indeed the Deng-led communist regime "rests most of its claims to legitimacy now, in fact, on patriotic sentiment and the pride and satisfaction all citizens are presumed to take in the modernisation and strengthening of the nation's economy and in the enhancement of Chinese power and influence in the international arena".

A successor regime, to consolidate itself, is likely to be even more strident in its nationalistic rhetoric because "the Chinese people, generally speaking, seem quite responsive to the prods of official patriotism".

A likely "pattern of state [and Communist Party]-corporate-military interpenetration and collusion", combined with "irredentism, deployment of an ideology of militant nationalism and cultural purity" is hardly a comforting picture of a post-Deng China. Either way—whether China disintegrates or develops into a quasi-fascist state—New Delhi should tread warily.

Cultural and Political Autonomy in Indian Society

Satya P Gautam

Indian society not only faces problems in its autonomy from external pressures, both in political and cultural domains, it faces equally strong pressures from within its own structures, traditions and practices

I

THE ideal of autonomy has gained considerable significance in recent times In theoretical discussions and analysis, social and political theorists and moral philosophers have questioned or justified the principles and practices of the liberal democratic states by invoking one or the other version of the ideal of autonomy Similarly, political and cultural activists have invoked this ideal to defend the rights of individuals and communities to survive and flourish without any external interference and control While autonomy is recognised and defended as a prerequisite for the very possibility of a civil society, there is an equally clear perception that the recent economic, political, technological and cultural developments have been significantly contributing towards the erosion of the autonomy of individuals and communities A major source of threat to the autonomy of the people of the third world can be seen in the western tendency to continue its domination with its control over technologies of communication, armaments, transportation and production This needs to be understood not merely in cultural and political terms but also in terms of the requirement on the part of the west to control and perpetuate the existing patterns of consumption of the global resources by which its high standards of living are maintained The west (also known as north these days) manages to do this by keeping a control on the global trade and financial markets through various mechanisms Western domination, achieved by means of unequal and unbalanced exchange of material goods, ideas, and skilled persons, is very much a part of the culture, politics and economy of the Indian society Socio-political and economic decisions at the government level continue to be taken under conditions of lack of autonomy

Autonomy, as self-rule, is to be seen as freedom from both external and internal heteronomy Indian society not only faces problems in its autonomy from external pressures, both in political and cultural domains, it faces equally strong pressures from within its own structures, traditions and practices Therefore, any discussion of the problems of cultural and political autonomy is bound to be multi-dimensional and multi-contextual Similarly, the aspirations for autonomy may also be rooted in diverse backgrounds relative to the vantage point of the individual or the community which chooses to pursue the project of achieving autonomy Autonomy should be seen as a project to be realised or achieved as it involves an active effort to give to oneself laws for determining one's conduct and affairs Autonomy is derived from the Greek terms auto (self) and nomos (rule or laws), used to distinguish such city states which made their own laws from those which were governed by the laws made by others In more recent times Kant contrasted between autonomy and heteronomy to distinguish between free rational conduct and actions lacking the condition of self control In the utilitarian liberal tradition autonomy has been seen as an individual's capacity to make choices and determine his/her own goals In the liberal individualist theory, autonomy is regarded as a standard by which actions and persons are judged in the sense that a person is not merely someone who *can* control his/her actions but someone who *should* control his/her actions as an autonomous free being separate and distinct from other persons Since the quest for autonomy does not arise in a vacuum, it needs to be seen as an outcome of the reflective activity of reason on one's role and place in one's social environment Individuals as well as groups or communities of individuals can aspire to exercise autonomy by gaining mastery over their circumstances by refusing to be merely passive bearers or instruments of their psyche and history Without adopting a critical reflective stance towards one's inclinations desires, emotions and ambitions (in case of individuals), customs, laws, traditions and future plans (in case of communities and societies), it is not possible to pursue the ideal of autonomy

I am well aware that the above brief characterisation of autonomy may not cohere with many other conceptions or characterisations of it These divergent conceptions can be analysed and evaluated with reference to the contexts in which they have been characterised, sharpened and defended I do not propose to go into this in this paper However in considering various conceptions of autonomy as expounded within the individualist and collectivist intellectual traditions we may do well to remember that we are *not* born autonomous but *become* autonomous by acquiring certain intellectual and practical capacities which enable us to appraise, order and control our instincts, impulses and inclinations and to change our natural and social environment in accordance with our choices and decisions Becoming autonomous is not a matter of all or nothing, or once for all The projects of becoming autonomous involve diverse elements and could be realised up to varying degrees in different ways It is part of our cognitive and active finitude that one could make mistakes in the formulation or realisation of the project of becoming autonomous And this very integral feature of human condition lies at the root of conflicts in the pursuit of autonomy by different individuals and communities It is possible for heteronomous persons to become autonomous and [illegible] versa as it is possible for subservient [illegible] ited communities to achieve autonomy [illegible] achieving autonomy from external heteronomy and internal heteronomy in the contexts of individuals and communities may also need to be distinguished according to the specificity of the project

Since the various forms of quest for cultural and political autonomy have been influenced by different conceptions I wish to present selected and brief accounts of a few possibilities for consideration These are only selective instances from the complex Indian scene But we shall have more than sufficient material for analysis even from these limited illustrations

(i) A large section of the tribal and rural population of the country lives under conditions of acute poverty Before one can envisage the democratic possibility of their being able to actively participate in the decision making processes influencing the politico-economic and socio-cultural affairs of the republic one has to think of their minimal needs education health care and so on From the modernist perspectives on autonomy, as they have virtually no control over the decisions concerning their own living conditions, these populations cannot be regarded as autonomous Activists of the voluntary organisations engaged in working with such sections of the population speak of their empowerment through spread of literacy, imparting of skills for sustenance, hygiene, etc But some activist groups also speak of the 'cultural autonomy' in the context of these communities It is contended that the outsiders from the so-called civilised modern world are responsible for their present unfortunate miserable conditions as they have deprived them of their natural resources and disturbed or damaged the ecology to satisfy their own

greed. It is pointed out by these activists that these people may be illiterate and poverty-ridden but they have their own values, beliefs, skills, crafts and rituals which have been orally transmitted from generation to generation for centuries. In the name of their development, it is claimed, the outsiders have no right to deprive them of their cultural traditions. It needs a serious consideration as to to what extent outsiders have a right to protect the autonomy of others. Does it not smack of some form of paternalism?

(ii) Among the major problems being faced by the post-colonial Indian state are those of (i) the relationship between the central government as the chief organ of the Indian state and its component parts, namely, the provincial or state governments, and (ii) the majority-minority relations (radically different from the electoral majorities-minorities of the western liberal democracies) which are invariably identified in terms of regional, ethnic, religious and caste identities. In more moderate and sanitised versions, the problem is usually articulated in terms of 'centre-state relations' but has also been vocally expressed in terms of 'political autonomy' for a 'nationality', 'community' or a people claiming a distinct identity. Demands for the formation of new states to be carved from the existing state-boundaries have often been projected as aspirations for cultural and political autonomy of the people concerned. In this context, it would be relevant and significant to consider: (i) Why has the project of a pan-Indian identity not been effective enough to contain and encompass the other identities? (ii) Will a restructuring of the centre-state relations be sufficient for meeting the demand for political autonomy, or is some other kind of radical restructuring in the political institutions required to sustain the political unity of the republic?

(iii) During the colonial era, the periodisation of the Indian history was done in terms of the Hindu, Muslim and British rules. This periodisation was questioned and subsequently revised in terms of ancient, medieval and modern phases. But the revision in nomenclature did not succeed in undoing the damage which had been done by the earlier characterisation. Sections of Hindus and Muslims continue to perceive the past through the distorting prism. The ideologies of the Hindu Maha Sabha and RSS explicitly, and some others indirectly, maintain that the Hindus in India have lived under political and religious slavery and subjugation for several centuries, first under the alien Muslim rulers and subsequently under the British colonial empire. The upholders of this view claim that complete liberation from alien subjugation is possible only through a return to a pristine pure nativity. Aspiration for cultural and political autonomy in terms of a recovery of lost freedom is articulated as an ideology of Hindu self-assertion. This tendency gains strength from such interpretations of nationalism which glorify nation as "coming to self-consciousness of a historical subject" through the "discovery of creation of a common past—it is the story of the victory and triumphs, defeats and betrayals which have formed the nation". Recent happenings are a disastrous manifestation of such an exclusivist approach to cultural and political autonomy. This raises several significant questions about the characterisation of cultural and political identities, inter-cultural interactions, and resolution of conflicts in a complex pluralist society.

(iv) Academies in the universities, research institutions and colleges have been engaged in the study of what have been traditionally known as the humanities and social sciences. During the post-independence era, they have been using western categories and conceptual schemes to analyse, interpret, describe, explain and understand the various facts and elements of the Indian social reality. Some of them have gradually started realising that "western models and concepts do not seem to apply to the Indian experience" but only contribute towards "distortions in the analysis of Indian social reality". Some of them go a step further and point out that "western education has alienated us" from the "vital Indian intellectual traditions" and it only contributes towards "a trained incapacity of Indian scholars to construct cognitive alternatives". Many intellectuals characterise the prevailing academic scene as 'academic imperialism' with a call to free ourselves from the 'enslaving modes' of western thinking. It is also emphasised by a section of the scholars that we need to learn to recognise and appreciate the richness of the indigenous intellectual traditions in areas as diverse as mathematics, linguistics, philosophy, aesthetics, politics, medicine, architecture and so on. It is contended that without keeping these intellectual traditions alive, our fractured cultural identity is going to be further damaged to the extent of total disappearance. The aspiration for autonomy is characterised in terms of "articulation, critical evaluation and creative development" of the indigenous intellectual traditions. The aspiration for cultural autonomy is proposed to be pursued through a conceptual reconstruction of the Indian intellectual traditions which have been "elaborated, refined, and developed over millennia". In this context, it would be relevant and significant to consider: (i) To what extent is it possible to use the indigenous concepts from the classical texts to analyse, interpret and understand the contemporary social reality? (ii) Can such a pursuit be possible within the existing educational system? (iii) To what extent is this quest for going back to the rich traditions of the past rooted in the perception or recognition that the Indian intellectuals are isolated or cut off from the complexities of contemporary Indian social reality so that they find themselves irrelevant and their work inaccessible to the people at large? (iv) How will it become possible for the Indian scholars to become more relevant and active participants in the social and cultural life of the Indian people?

Society as an orderly system of interaction among its members is possible only so long as the participating individuals believe and accept that their own specific ways of conduct, reflected in their customs and codes, are right and proper. So long as most communities lived in small and isolated settlements, it was possible for different cultural groups to take pride in their distinctive ways as the only right way or the most superior way. Using the categories of savage, barbarian, uncivilised, primitive, etc, to condemn the alien cultural practices while holding one's own community as the civilised, cultured and, thus, superior to others was an important way of legitimising and perpetuating the dominant practices of the community.

But over the millennia, cultures in different societies have changed gradually and significantly. These changes became possible because each new generation not only learnt and assimilated the cognitive and active skills from the previous generations but also analysed, appraised and gradually extended them in an endeavour to confront the previously unresolved questions and the new problems faced by it. In these efforts, mistakes were often made which were left for the next generations to identify and rectify. But till these mistakes were/are discovered, they remain(ed) as much an accepted part of the received heritage as the achievements and successes of the past generations.

Ethnocentricity, narrow sectarian attitudes, dogmatism and close-mindedness are related to the safer and convenient approaches adopted by individuals in hierarchical and rigid social formations during the early periods of civilisation. In the early social formations, one of the major obstacles to individual autonomy was the dominant trend of unquestioned acceptance of the prevalent customs, codes and norms, as deviance was not only punished severely but the options available to potentially dissenting individuals were extremely limited. The lack of effective alternative courses of action tended to encourage individuals to follow rather than deviate from the received traditions. These attitudes not only have survived but also continue to operate quite effectively even when members of different cultural communities fight one another with the same weapons, compete against one another for acquiring the same technologies, use common satellite networks for communications, and seek to outwit one another in the common arena of global market. These attitudes continue to dominate because many of us find it difficult to get rid of the ancient fallacious assumption that our unique and specific socio-cultural heritage is not only superior to or better than others but is also an essential feature of our distinctive identity, unity, solidarity and survival as specific cultural communities. In doing so, we tend to forget that, over the millennia, there has been considerable exchange (sometimes voluntarily but sometimes forced, sometimes deliberately planned and sometimes by the exigencies of circumstances) and interaction among different cultural communities so that it would be impossible to visualise how any cultural tradition would have developed in total isolation from the other cultures. Therefore, any attempt to search for a pure, unpolluted indigenous cultural identity rests upon a neglect of the ways in which cultural traditions have evolved and functioned in history. Such endeavours also rest upon an essentialist, monist, exclusivist ahistorical view of cultural 'identity' which invariably moves a mental closure against the perception of possible inconsistencies within a cultural tradition, and the possibility of conflict or clash between different structures, elements and norms within the same culture. This attitude is contrary to the aspiration for autonomy as any exercise of autonomy demands not a blind conformity but a critical questioning of the received traditions. Any quest for cultural autonomy involves a willingness to compare different cultures, recognising their relative strengths and weaknesses, powers and limits.

Why do we find a tendency to protect and safeguard one's cultural traditions in the garb of cultural autonomy? Partly, it has to do with the hangover of the dogmatic, sectarian and narrow-minded attitudes which have been mentioned earlier. But partly it has to be understood as a response to the rightly or wrongly perceived threats in an atmosphere charged with deep prejudices, fears, apprehensions and suspicions arising out of the use of cultural, religious and ethnic identities for narrow political gains. The process of dialogue and openness towards one another, indicating a willingness to learn from others, is likely to result in consequences inconvenient to those sections or groups which are beneficiaries of the existing inegalitarian and hierarchical structures. To contain, mask and distort the prevailing structures which obstruct the realisation of aspiration for autonomy on the part of individuals and oppressed sections of society, the cultural and political elites find it convenient to organise and activate the masses under the banner of protection of ethnic, communal and casteist identities by reclaiming collective memories of past oppressions, invasions, injustices and conflicts. These tendencies are not specific or exclusive to any particular part of India. At different times they may seem dormant in one part and manifestly active in another. Whenever the situation crosses the critical point, it is only then that we start hearing of a crisis. Otherwise, we tend to remain oblivious of what has been constantly happening all the time simply because it does not directly harm or hurt the relatively privileged and more articulate sections of Indian society. In this context it also needs to be noticed that the modern liberal discourse of autonomy is taken advantage of to propagate traditional communal and caste identities. Thus the secular language of political and religious tolerance is used for non-secular goals. Perhaps such distortions are not only convenient but also become necessary when there is only a semblance of civil society in the name of a democratic polity. The old feudal and colonial tendencies and methods of obtaining submission and obedience through brute force or contrived manipulations continue to operate despite the constitutional provisions of fundamental rights and directive principles of state policy.

A careful look at the construction and projection of pan-Indian identity during the freedom struggle may also be of some help to understand the complexities of the present situation. Being an 'Indian' provided an ascriptive unifying identity against the British. This identity was adopted by the middleclass, western educated elite to pursue the goal of political autonomy. But communal, caste and regional identities were also invoked and used for mobilising the masses to participate in the freedom struggle. How the encompassing pan-Indian identity would be sustained (without threatening the other ascriptive identities) in the post-independence era was not given sufficient attention during the period of struggle for independence. Consequently, we continue to face the constant tension between the homogenising universalist tendency, superimposed by the leadership of the nationalist freedom movement, and the heterogeneous particularising tendency expediently invoked to launch various struggles against the post-independence ruling elite by the newly emerging leadership. But these patterns and strategies are a continuation of the political processes initiated during the pre-independence period itself. During the post-independence era, the old politics of cooption, adjustments and compromises has only been taken to its logical conclusion in an effort to maintain and safeguard the structures of power and authority inherited from the colonial masters. Political autonomy for the Indian people would be possible only through a questioning of the policies of this new ruling elite and struggling for alternatives which may contribute towards the setting up of a civil society. It seems uncertain, at the present moment, whether an alternative political movement will emerge and sustain itself. Whether the lure of ethnic, religious and linguistic identities would permit the requisite sense of discrimination to identify and reduce, if not eradicate, the real sources of subordination and marginalisation—it is difficult to conjecture. But it would be a wishful thinking that the goal of decolonisation, one form of political and cultural autonomy, can be achieved simply by taking a collective decision to not be trapped or lured by the western sensibilities and striving for a reconstruction of indigenous or 'authentic' belief systems and values.

In Praise of Reform

Aditya Bhattacharjea

India in Transition: Freeing the Economy by Jagdish Bhagwati; Clarendon Press, Oxford, 1993; pp 103, Rs 150.

DELIVERING these Radhakrishnan lectures at Oxford in June 1992, Jagdish Bhagwati had reason to feel satisfied, even triumphant. After more than a quarter century of urging market-friendly economic reforms on his country's pertinacious policy-makers, he was no longer (as he put it) "kicking yet again against a stone wall". Instead, he was singing the praises of the Rao government's 'reform by storm'. Crediting finance minister Manmohan Singh with taking India on her 'tryst with destiny', Bhagwati declared "we are finally in the spring of hope".

It is impossible not to compare this assessment of India's economic record and future prospects with that of the late Sukhamoy Chakravarty, who had delivered the Radhakrishnan lectures seven years earlier. (An expanded version was published as Chakravarty 1987). Bhagwati's is much more readable, generously leavened with witticisms and anecdotes. There is, however, a certain glib superficiality in these lectures, the result perhaps of the euphoric mood in which they were delivered. In contrast to Chakravarty's carefully nuanced analysis, Bhagwati depicts the state of the economy up to 1991 in sombre black, and its future in a generally roseate hue. Thus, while Chakravarty's core chapter was (rather infelicitously) called 'Vicissitudes in the Career of a Strategy', the corresponding chapters in Bhagwati are more bluntly entitled 'The Model that Couldn't' and 'What Went Wrong?'. (With perhaps unconscious irony, a third chapter is entitled 'What Is To Be Done?') Apart from these stylistic differences there are, of course, differences on points of substance. A few of these will be indicated below. But instead of confronting Bhagwati with Chakravarty, I shall have occasion to confront him in this review with his own earlier writings on India and on trade policy.

India in Transition begins with an excursive account of how India has been perceived by governments and economists in the west, which as it turns out, means the US. These perceptions went through kaleidoscopic changes, mirroring geopolitical and ideological developments, resulting in periodic "reversals of the ideological preferences of the intellectuals' rank-ordering of India and China" (p 13). The purpose of this historical sketch, according to Bhagwati, is to bring out distortions in the west's perception of India, by confronting it with reality. However, he never gets around to doing this adequately, and this unnecessary prologue, positing India and China as alternatives, remains unintegrated with the rest of the book. (In his Preface, Bhagwati says he has drawn on his "recent work on the sources of friction between the US and India in the post-war period"; it is presumably this which has been summarised and made to serve as a rather inappropriate overture to these lectures).

Coming to the reality, as opposed to these perceptions, of Indian development, Bhagwati gives credit to India for maintaining a functioning democracy (except during the Emergency) and containing secession, but does not excuse its miserable record on growth and poverty alleviation on that account. He then adopts an instrumental view of growth as being necessary for poverty alleviation, and counterposes this against three 'fallacies' in development thinking. The first is that poverty removal requires direct anti-poverty schemes, not growth. This is promptly qualified by recognising that both require targeting policies in favour of the poor, but growth (even if it bypasses the poor) is still held to be essential in order to finance anti-poverty measures. The second fallacy, according to Bhagwati, is that developmental strategy in India until the 1980s emphasised growth and neglected poverty. To refute this, he goes lightly over the same ground as Chakravarty (1987, Chapter 3), whose 'thorough' treatment he acknowledges, adding only personal anecdotes of questionable relevance, and chiding (unnamed) economists for 'rediscovering' the problem of poverty in the 1970s. The third fallacy is that the growth approach is a conservative 'trickle-down' strategy; Bhagwati sees it rather as "offering a radical, interventionist, pull-up strategy" (p 32).

To this reviewer, this controversy seems to be a storm brewed in a tea-cup, in which Bhagwati seeks to drown sundry straw men. The conflict between growth and poverty removal is caricatured, and wrongly posed in terms of intentions rather than experience. Poverty had to be 'rediscovered' in the 1970s not because growth-oriented planners callously disregarded it earlier, but because of accumulating evidence that the benefits of growth were not in fact trickling down in many countries. Bhagwati's perception seems to have been permanently coloured by his brief stint under Pitambar Pant in the Planning Commission in the early 1960s, when growth was indeed seen as the remedy for poverty. A decade later, the Approach to the Fifth Plan took a very different view. In Chakravarty's words (in the same chapter Bhagwati commends), "It showed that if the growth rate of around 5-6 per cent per annum was about the maximum one could have, it was impossible to bring about a reduction in poverty, howsoever defined, without attacking the problem directly" [Chakravarty 1987, p 36, emphasis added]. Bhagwati concludes his chapter with the unexceptionable arguments that "the nature of growth matters as much as growth itself", and that growth and direct anti-poverty schemes can be complementary, but asserts again that inadequate growth is responsible for the limited success of India's anti-poverty efforts. Nowhere does he spell out how exactly growth entails a 'radical, interventionist' approach. He distances himself from *laissez-faire* and calls for productive rather than counter-productive intervention: "There are plenty of things for the government to do" (p 98), but apart from providing primary education, he does not have anything particular to suggest.

The poor growth record is invariably depicted by Bhagwati in terms of aggregate or per capita GDP, even though he specifies that it is agricultural growth that impinges directly on poverty. Yet, throughout these lectures he has little to say about the agricultural sector, presumably because that is not where his intellectual comparative advantage lies, or because it does not fit into his theme of "freeing the economy". At the very outset, he excludes consideration of India's successful policies and performance in transforming traditional agriculture" (p 17n); here the contrast with Chakravarty's book is especially marked. Even if Bhagwati wished to confine himself to industrialisation, sectorally disaggregated growth figures would have forced him to contend with variations in the industrial growth rate, with rapid growth in the Second and Third Plan periods despite controls, and again in the 1980s accompanying limited liberalisation, for which he is less than enthusiastic. He attributes the better (GDP) growth performance of the 1980s mainly to debt-financed fiscal expansion, but sourly remarks that since it took the form of inflated wages and salaries, implicitly in government services, it should be seen as growth of transfers rather than real national income (pp 92-93). The fact of an increase in the industrial growth rate during the 1980s seems to have escaped him. Ahluwalia (1991) and now Srivastava (1994) have presented evidence of productivity improvements in this period that they attribute to liberalisation, while Kelkar and Kumar (1990) point to new inefficiencies and distortions. Growing fiscal deficits were surely responsible in part for the industrial acceleration; this would be consistent with Srivastava's finding that productivity grew thanks to better utilisation of labour (a 'quasi-fixed' input), with no evidence of reduced price-cost margins.

The chapter on 'What Went Wrong?' contrasts the planners' obsession with capital accumulation and allocation with their neglect of productivity. India's success in raising saving and investment rates, according to Bhagwati, was nullified by rising capital/output ratios. He tersely but fairly

effectively rebuts the hypotheses that overestimated savings, underestimated growth, or compositional shifts among sectors were responsible for rising capital/output ratios. He does not, however, adequately deal with Chakravarty's argument that diminishing returns in agriculture and in energy production raised the ratios in these sectors. Nor does he acknowledge that the east Asian miracle economies, to which he frequently . not only have much better productivity growth but also much higher savings rates than India. In the light of this, it is not that easy to deride the (physical) capital accumulation bias of early development theory, which Bhagwati associates with "the Marxist focus on 'primitive accumulation'... and also with the quasi-Marxist models of the investment-allocation literature that grew up around Maurice Dobb" (p 10).

Bhagwati puts the blame for low productivity on pervasive bureaucratic controls, inward-looking trade and foreign investment policies, and "the spreading stain of inefficient public enterprises"—a triad he has railed against for many years. This 'oppressive framework above' is met in a pincer movement, as he puts it, by 'widespread illiteracy below', the result of India's neglect of primary education. On this, he cites Weiner's recent work (1991), and asserts a close relationship between literacy and productivity growth. His critique of the industrial and trade policy regimes follows the trail he himself blazed (along with Padma Desai and T N Srinivasan) in the 1960s and 1970s. Since this theme has been developed at length elsewhere, he is very succinct on the deleterious consequences of controls. In one of his more apt anecdotes, he recalls arguing in 1967 with the bureaucrat in charge of industrial licensing, who maintained that without licensing, resources would be frittered away on producing lipstick. "As I heard this", recounts Bhagwati, "I could not help smelling the Brylcream in his hair"! A decade ago, one would have responded that this indicated the need for more extensive controls, on the pattern of production as well as demand generation. Nowadays, we are wiser and sadder.

However, Bhagwati cannot be allowed to get away with questionable interpretations of the intellectual origins of the control regime. The following statement is decidedly misdirected:

> the failure to understand that markets will generally work better than central planning as a resource-allocational device... was manifest in the early assertions, from the writings of Barone, Lange and Lerner, that centralised planning would work better than a decentralised market system because it would calculate prices better. It was left to Hayek to expose the illogicality of this position by arguing that central planners would not be able to secure the information and knowledge that micro-level decision-makers alone would have. (Bhagwati 1992, p 51; a similar indictment of the Lange-Lerner mechanism is made on p 65.)

Most readers will recall that the Lange-Lerner system was conceived as a decentralised alternative to central planning under socialism, possessing all the features of the competitive price mechanism—and was trenchantly criticised by Dobb (1953) for that very reason. The reference to Hayek is debatable, but requires a digression that is better left to a lengthy end-note.[1] Bhagwati gives not the slightest evidence that the Indian control regime was influenced by the classic writings of Lange and Lerner, or for that matter by those of Rosenstein-Rodan and Hirschman, whose arguments for planning investment allocation he also implicates. Rosenstein-Rodan's focus on the pattern of consumer demand generated by an investment plan is in fact conspicuously absent in India's 'open-loop' planning models. Their preoccupation with ex ante supply-side consistency in an input-output sense is similarly far removed from Hirschman's prescription of stimulating deliberate imbalances And both authors' central concern, the inducement to invest, was neglected in debates on the Indian economy until the late 1970s. The Indian control regime in Bhagwati's eyes certainly has a muddled pedigree; elsewhere, he asserts that "India drew her policy ideas from Fabian politics and English economics (*sic*)" (p 21)![2]

On two issues, Bhagwati is much harsher than even his own earlier very critical writings on India. A three-paragraph section on direct foreign investment asserts offhandedly that the web of controls impeded technological change in Indian industry. While this is open to debate, Bhagwati cites no evidence to back his charge, unlike his documentation of most of his other indictments. The public sector also comes in for sharper criticism. Now Bhagwati admits that he was wrong to have expected any improvement: "the conditions that would make the public sector productive and efficient seem beyond reach, at least in India" (p 65).

Public-sector losses are now also seen as a macro-economic problem, contributing to the fiscal crisis that led to the current reforms. Sensibly, Bhagwati avoids blaming the crisis solely on bad micro-economic policies; political instability and external factors are given their due role. In particular, he points out that the deterioration of the aid environment, consequent on the diversion of funds to eastern Europe and American domestic problems, made donors more careful about the efficiency with which their aid was used. The dimensions of the crisis, and of the reforms of the 1980s and 1991, are spelt out in some detail, presumably for the benefit of the Oxford audience in 1992. Commenting at that time on the unfolding reform programme, Bhagwati inferred from the lack of decisive action on the external front that the government had chosen a deliberate sequencing of domestic before external liberalisation. His discussion of 'partial convertibility' is now dated, and there is of course no discussion of the tariff reductions of 1993, or of privatisation or foreign portfolio investment.

Bhagwati's 1992 prognosis was optimistic, although two years later his assessments are on weaker ground, and some of his caveats sound more dire. He recognised that the success of the reforms depended on producing quick and substantial results, which was made difficult by the need for fiscal stabilisation. His concern at the depressed growth rate for 1991 echoes louder now, with fiscal profligacy co-existing with industrial stagnation. His suggestion to cushion the impact of stabilisation on urban workers by channelling food aid from the US and EC through the public distribution scheme is doubly dubious. First, despite being Arthur Dunkel's Economic Policy Adviser, he does not seem to have foreseen the effects of the Uruguay Round on global food availability consequent on cutbacks in subsidies. Second, independent of availability, he does not recognise what Amartya Sen would call entitlement failures consequent on the unemployment resulting from stabilisation-cum-adjustment programmes. Without incomes, how are unemployed workers expected to buy even subsidised food? The government's bloated food stocks are symptomatic of demand failure even without substantial layoffs.

Bhagwati's suggestion that the geopolitical environment is ripe for playing a 'Japan card', encouraging aid and investment from that country, seems less of a winner now, given Japan's political and economic travails. Finally, he repeatedly insists that credibility and forward momentum in the reform process are crucial, and suggests that it be marketed politically as part of the war against poverty, presumably reversing the syllogism of poverty being the outcome of inadequate growth, which is caused by low productivity, which in turn is due to the control regime. This reasoning is surely going to be hard to sell as a mass platform.

I conclude this review with some general observations. The first is that the Jagdish Bhagwati of this volume is in several respects a different commentator from that of his earlier writings. Looking back at his early work at the Planning Commission, in an introduction written for a volume of his essays [Bhagwati 1985, p 2], he wrote: "The basic theme, i e, growth with a view to eliminating poverty, may have been too optimistic; indeed I think it was." By 1992, his optimism seems to have returned. In a 1975 essay reprinted in the same volume (p 86), he emphasised the need for economists to be more politically sensitive in their prescriptions; to learn in particular the lessons of 1960s trade reforms, which showed that while liberalisation of non-competitive imports was feasible, that of competitive imports was not. In 1992, he is sanguine about India's ability to accept the pains of competition, and quite dismissive of concerns for job security: "The public sector has so far operated on the assumption that, given the scarcity of jobs, it is bad enough to find one job in a lifetime and to ask people to find two is nothing short of cruel and unusual punishment. Without effective exit, the efficiency gains from other reforms will remain limited, for sure" (p 91). With the prime minister scrambling for the 'Middle Path' at Davos, enunciating a doctrine of

painless reform, the exit policy has disappeared from official discourse. Fiscal recidivism plagues North Block and it is not clear whether the momentum is being sustained. Bhagwati's 'spring of hope' may yet turn into his winter of discontent.

As Bhagwati's own theoretical work demonstrated to the economic profession, first best policies applied in second best contexts can be counterproductive [ibid 1985 p 86]. Yet there is no recognition in these lectures of the many such contradictions in the reform package. In particular, the liberalisation of capital and intermediate goods imports, combined with the demand stimulus of tax cuts, has probably increased the effective rates of protection of most consumer goods whose imports remain prohibited or subject to tight quantitative restrictions. Relaxed investment licensing has permitted excessive entry, with the absence of exit options preventing rationalisation. Many of these industries thus produce for the domestic market at inefficiently low scales and at high resource costs measured at world prices, and are highly capital intensive [Kelkar and Kumar 1990]. (This would also be consistent with high capital output ratios Bhagwati deplores.) Direct foreign investment in a protected capital intensive sector was theoretically shown two decades ago to be 'immiserising' by Bhagwati and several others; empirically it was held to have reduced growth in two of the country studies of the voluminous NBER project on foreign trade regimes and economic development co directed by him in the 1970s (see ibid 1985 pp 6 and 130 32 for a summary of these findings and caveats on foreign investment). Eight years ago I had tentatively pointed out some of these contradictions in these columns [Bhattacharjea 1986] and also quoted from the NBER studies on the striking lack of evidence linking export promoting strategies to greater efficiency, technical dynamism, or higher savings [Bhagwati 1985 p 133].

Revising former beliefs is a virtue not everyone possesses. Bhagwati himself has joked about the frequency with which economists change their minds on important policy issues [ibid p 84]. Possibly he believes that these inconsistencies are only transitional and will be overcome by the forward momentum of the reform process. On the other hand, if things do not work out he can always cover himself with the charge that the required package was not implemented in its entirety. For the present his optimism can only be based on locating the policy changes in a political vacuum. For despite his earlier plea for political sensitivity, and his own substantial work on the political economy of trade policy, Bhagwati takes a very idiosyncratic view of policy formulation in these lectures. The bad old *dirigiste* policies are held to be 'wittingly foolish and irrational' (p 18). Scathing remarks are made about the pernicious role of economic dirigisme (p 51) and the culpability of India's economists for the country's failings. Bhagwati shows some sympathy for "the cynical view that India's misfortune was to have brilliant economists" (p 54).

Although the 'general population' fed up with the permit raj, is seen to make for a broad pro reform constituency (p 82), the reforms themselves are seen to be a triumph of the right ideas, conceived by the right sort of economists and implemented by the right sort of politicians. With a patriotic flourish, Bhagwati eagerly reclaims the credit for these ideas for himself and his fellow Indian economists, denying the parentage of the World Bank and IMF (pp 68 69). His hosannas for Narasimha Rao, Manmohan Singh and their team echo through the book; he even takes pride in the fact that he went to the same colleges at both Oxford and Cambridge as Manmohan Singh (p 3)! In Bhagwati's view, most of all the psychology of the leadership that took power in June 1991 must provide the ultimate compulsion for the reforms unleashed by it (p 83). Apart from few rent seeking lobbies, he sees no serious political obstacle to the reforms. This panegyrist's view of change centred on personalities and ideas is possibly what causes him to suspend the critical judgment so effectively deployed in his earlier work. Success is said to have a thousand fathers, but the verdict is yet to come in on the Indian reforms and Bhagwati's paternity suit may yet be premature.

Notes

1 Bhagwati cites (p 51n) a 'seminal' essay by Hayek entitled 'Economics and Knowledge'. This, it turns out, is largely methodological, concerned with the informational content of equilibrium, only tangentially with central planning, and makes no mention of Barone, Lange and Lerner. In fact it was first read at the London Economic Club in November 1936 [Hayek 1949, p 33n], while Lange's essay was published in 1938 and Lerner's *Economics of Control* in 1944. Hayek was certainly aware of proposals for a market based socialism even earlier, but it was not until 1940 that he published a very critical review [reprinted as Chapter IX in Hayek 1949] of Lange's essay and a book by H D Dickinson propagating similar ideas. The information issue arose specifically in the context of their scheme for allocation of capital to socialised enterprises via a 'shadow' interest rate determined by supply and demand, mimicking the capitalist market without private ownership of capital. Hayek's point was that this would be unworkable because the enterprise managers would not have to suffer the consequences of their mistakes and would not therefore correctly value the productivity of their investment plans [ibid pp 199 203]. He then alleged, without any textual evidence: "It seems that here the two writers [Lange and Dickinson] are unconsciously led to fall back on the earlier beliefs in the superiority of a centrally directed system over a competitive system" (p 201) for investment allocation. It was in this context that he referred to his essay 'Economics and Knowledge', investing it retrospectively with a practical significance it does not seem to have originally possessed. This critique of planning was developed in Hayek's later works, one of which Bhagwati mentions. The problem, although certainly a very real one in socialist economies, is now also of course the subject of a vast 'principal agent' literature in the theory of the (capitalist) firm.

2 If anything, excessively detailed regulation of the private sector can be seen as a continuation of the wartime policies of the colonial government. This thesis has been recently argued by Tomlinson (1993, Chapter 4), who is equally critical of the consequences of this adherence to *dirigisme*. He points out that comprehensive controls instituted in the 1940s—on imports, foreign exchange, prices, and capital issues—were carried over in various ways into the post independence period for practical rather than ideological reasons. Nor was licensing just a bureaucratic hangover. In consultation with leading industrialists, the short lived Department of Planning and Development (1944 46) headed by Ardeshir Dalal, a director of Tatas, proposed an industrial policy with regulation through licensing for 20 key industries. Finally, the central legislation on industrial controls, the Industries Act of 1951, actually pre dates the theoretical literature on investment planning which Bhagwati indicts for spawning the licensing system "which then grew like Frankenstein" (p 53). (Incidentally, here Bhagwati makes a common mistake: in Shelley's novel, Frankenstein was not the name of the monster but of the scientist who created it!)

International Trade and the Agricultural Sector in India

Deepak Nayyar
Abhijit Sen

This paper analyses the impact on Indian agriculture of trade policy reform in India and multilateral trade liberalisation internationally.

The rationale and structure of India's trade policy regime for agriculture over the last three decades are outlined to highlight the fundamental departures implicit in the recent trade policy reform. This is followed by discussion of the significance of the agricultural sector in India's economy and foreign trade on the one hand and the importance of Indian agriculture in world output and trade on the other and comparison of domestic and world prices for selected agricultural products.

The analysis is developed further to cover the implications and consequences of trade policy reform in India for the agricultural sector in particular and the economy in general. Shifting attention to the international context, the status of trade in agriculture in the multilateral trading system so far is outlined to bring out the fundamental departures contemplated in the Uruguay Round and their possible implications for the agricultural sector and the economy in India are examined.

Some conclusions that emerge from the analysis are drawn together in the final section of the paper.

I
Introduction

THE present conjuncture in India represents a watershed for the economy which may have profound implications for the agricultural sector. At the same time, developments in the world economy, in particular the multilateral trading system, may also have important consequences for world output and world trade in agriculture. The process of macro-economic stabilisation combined with fiscal adjustment and structural reform in India would of course be constrained by what happens in the agricultural sector, but would also have a significant impact on Indian agriculture particularly insofar as it moves domestic prices of inputs and outputs closer to world prices. The conclusion of the Uruguay Round of multilateral trade negotiations, largely in accordance with the Dunkel Text, would inevitably change the structure of relative prices for agricultural commodities in the world economy. Taken together, these developments may have serious implications and consequences for India, not just in the agricultural sector but in the economy as a whole. The importance of the issue should be obvious. Yet, the subject has received little attention from scholars and policy-makers, at least so far.

This paper seeks to analyse the impact of trade policy reform in the national context and multilateral trade liberalisation in the international context on Indian agriculture. In doing so, it is clearly not possible to abstract from other problems of the agricultural sector or limit the focus to the regime of trade policies alone. Hence the discussion needs to be situated in a wider context.

At the outset, it is essential to recognise the limitations of such an exercise. For one, it is always difficult to contemplate the future in a world where the degree of uncertainty is high and developments are interdependent so that arguments are at best *ex hypothesi*. For another, methods of economic analysis are not versatile enough to capture the consequences of change which is so large that it may reshape the parameters. In other words, there are too many imponderables. But that is not all. There are, in addition, two complex methodological problems. First, the small country assumption, so often the basis of conventional economic analysis, is simply not valid for the theme of our paper. This is partly because India's share in world output for many agricultural commodities is high and partly because a relatively small proportion of world output enters world trade in several agricultural commodities. Thus, how much India buys or sells in the world market would affect world prices. Second, any discussion of international trade in agriculture cannot be confined to border measures that affect the movement of commodities across national boundaries. This is because domestic economic policies exercise a significant influence on output, prices and trade. Consequently, it is difficult to disentangle the effects of trade policies from those of domestic policies in the sphere of agriculture. Given these limitations, it would be idle to pretend that a short essay can provide a systematic analysis or an exhaustive discussion of the problem. This paper should, therefore, be read as a preliminary attempt to explore the issues.

The discussion is structured as follows. Section II considers the trade policy regime for agriculture in the national context outlining its rationale and structure over the past three decades to highlight the fundamental departures implicit in the recent trade policy reform. Section III sets out the facts by providing an assessment of the significance of the agricultural sector in India's economy and foreign trade on the one hand, and the importance of Indian agriculture in world output and trade on the other. Section IV attempts a comparison of domestic prices and world prices in terms of absolute levels and relative stability for selected agricultural commodities, even though such an exercise is fraught with statistical and methodological difficulties. Section V develops the analysis further to discuss the implications and consequences of trade policy reform in India for the agricultural sector in particular and the economy in general. Section VI shifts attention to the international context, outlining the status of trade in agriculture in the multilateral trading system thus far to highlight the fundamental departures contemplated in the Uruguay Round and examines the possible implications for the agricultural sector and the economy in India. Section VII draws together some conclusions that emerge from the analysis.

II
Trade Policy and Indian Agriculture

Over the past three decades, if not longer, the trade policy regime in India has made a clear distinction between the agricultural sec-

tor and the industrial sector, whether we consider its rationale or its structure. Traditional exports which originate in the agricultural sector, both plantation crops such as tea or coffee and cash crops such as tobacco or spices, that have always been an important source of foreign exchange earnings for the economy, constitute the exception to the rule. For these commodities, the open trade regime has continued from the colonial era. Apart from this, however, in the sphere of agriculture, foreign trade flows have been perceived as a residual whether we consider exportables or importables. For exportables, the difference between actual domestic production and estimated domestic consumption has determined the surplus available for export. For importables, the difference between estimated domestic production and desired domestic consumption has determined the volume of imports. In an accounting sense, *ex post*, trade flows always measure the difference between domestic production and domestic consumption after we allow for net changes in inventories. It needs to be stressed that, in India, agricultural trade flows have been a residual in an ex ante sense. This has been implemented either through quantitative restrictions or through canalisation or, over time, through some combination of both. For agricultural exports, quantitative restrictions in the form of licences or quotas have, more often than not, provided the means for regulating the volume of trade flows. But, for some agricultural exports, canalisation through state trading organisations has provided the means for regulating the volume or the value of trade flows. For agricultural imports, canalisation through state trading organisations has provided the predominant means of regulating trade flows. Insofar as such canalisation is limited to designated state trade organisations, the decision about the volume or the value of imports has been made by the government.

The rationale underlying this trade policy regime for agriculture, which regulated the volume of both exports and imports, has been a concern about domestic prices. A large proportion of India's agricultural exports, whether consumer goods or intermediate goods, are exportables which enter into domestic consumption or use so that the volume of exports can exercise a strong influence on domestic prices. Similarly, a large proportion of India's agricultural imports, whether consumer goods or intermediate goods, are importables produced in the agricultural sector so that the volume of imports can exercise a strong influence on domestic prices. The concern about domestic prices has been particularly important for exportables and importables which are wage goods, or inputs for wage goods, because the majority of the poor in India do not have incomes that are index-linked. In the pursuit of this objective, therefore, the volume of agricultural exports has been restricted to prevent domestic prices of exportables from rising as much as they otherwise would, while the volume of imports has been enlarged in order to prevent domestic prices of importables from rising as much as they otherwise would. There have been two dimensions to this concern about domestic prices of tradeable agricultural commodities. For one, the trade policy regime has sought to maintain domestic prices at absolute levels that are commensurate with average income levels. For another, the trade policy regime has sought to impart a stability to domestic prices in the interest of both producers and consumers.

It is not as if domestic prices have been the sole concern of the trade policy regime for agriculture. There have also been other concerns but, in terms of importance, these have been subsidiary or secondary. First, the balance of payments constraint has been a significant factor underlying restrictions on agricultural trade flows; this has been so mostly in the sphere of imports where the volume or the value has been restricted to economise on foreign exchange expenditure. Second, a concern about terms of trade has sometimes been a factor underlying restrictions on agricultural trade flows; this has been so mostly in the sphere of exports, where the trade policy regime has sought to stipulate a minimum export price or impose a ceiling on the volume of exports in order to pre-empt a deterioration, rather than seek an improvement in the terms of trade. Third, the need to protect domestic agriculture has occasionally been a factor underlying restrictions on agricultural trade flows; this has been so for a few importables such as oilseeds or rubber.

The process of stabilisation and adjustment initiated in mid-1991 has been associated with a wide ranging trade policy reform which seeks to increase the degree of openness of the economy.[1] The government sees this as a beginning rather than the end. It would thus be reasonable to assume that more is to come. Yet, it is clear that trade policy reform already implemented in the form of actual changes represents a fundamental departure from the erstwhile trade policy regime for agriculture. The new perceptions articulated by the government suggest that, over time, the domestic prices of inputs used and outputs produced by Indian agriculture would move closer to world prices.

The recent developments can be summed up as follows.[2] First, the canalisation of agricultural trade flows, which enabled the government to determine the value or the volume of imports and exports, has been almost abandoned. All agricultural imports other than cereals, oilseeds and edible oils have been decanalised. All agricultural exports, except onions, have been decanalised. Second, many of the quantitative restrictions on agricultural trade flows have been dismantled. Apart from the general restriction on imports of consumer goods (neither pulses nor dry fruits are defined as consumer goods for this purpose), there are no longer any quantitative restrictions on agricultural imports. In the sphere of agricultural exports, however, there has not been a symmetrical liberalisation: exports of coconut, copra, oil cakes, pulses, paddy, rice bran and vegetable oils are subject to licensing; exports of specified varieties of natural rubber and cottonseed cakes are subject to quantitative ceilings; exports of foodgrains, sugar and raw cotton are in theory possible without licensing but in practice subject to limits on quantities; exports of groundnuts, guargum and tobacco are subject to minimum export prices. It is apparent that the concern about domestic prices of exportables which enter into domesic consumption remains an important consideration in the trade policy regime. Third, the decanalisation of a substantial proportion of agricultural trade flows and dismantling of quantitative restrictions on agricultural imports has not been associated with a systematic restructuring on tariffs. There is no evidence that the trade policy regime has attempted a tariffication of erstwhile quantitative restrictions in terms of equivalence. There is some evidence, however, of a substantial reduction in tariffs on selected agricultural imports, which is obviously not part of the multilateral trade negotiations but possibly reflects conditions of the programme negotiated with multilateral financial institutions.

In the preceding paragraphs, we have considered the rationale of trade policy over the past three decades and the direction of the recent trade policy reform. The locus, however, has been on the agricultural sector. Yet, trade policy *vis-a-vis* the industrial sector has implications for the agricultural sector. The argument, stressed by orthodox economists, runs as follows.[3] The emphasis on import substitution, associated with an overvalued exchange rate and supported by import controls or tariffs in the manufacturing sector, discriminated not only against exports but also against the agricultural sector. The regime of export incentives employed to compensate for this was confined mostly to manufactured exports. The relative profitability of producing tradables in the industrial sector was, therefore, higher than that of producing tradables or non-traded goods in the agricultural sector. The implicit bias against agriculture then led to a misallocation of resources. It would mean too much of a digression to enter into a discussion or provide a critique of this approach here. Suffice it to say that the analytical construct is narrow. The excessive concern with static allocative efficiency criteria tends to ignore inter-temporal considerations, just as the as-

sumption that resources are perfectly substitutable between uses or mobile across sectors does not recognise structural rigidities in economies In keeping with the logic of this analytical approach, however, recent trade policy reform has reduced tariff and non-tariff protection for the industrial sector and sought to eliminate the overvalued exchange rate through a substantial depreciation The implications of these recent changes, for Indian agriculture are considered later in the paper

III

Indian Agriculture and World Trade

Any discussion of the possible implications of India liberalising its policies regarding international trade in agricultural commodities must begin by noting two important facts

The first, which is well known, is that world agricultural trade occurs in a highly imperfect setting where, as a result of non-tariff barriers imposed by developed and developing countries alike, world prices are determined by the relatively small surpluses and deficits which enter world trade and do not necessarily influence world consumption and production The implication of this is that world prices can respond disproportionately to even fairly small changes in the proportion of world output which is subject to free trade, and this effect is likely to be magnified even more if, as is often the case, the relevant price elasticities are small

The second important fact is that while India is a very large producer and consumer of agricultural commodities by world standards she is presently marginal as far as international trade in such commodities is concerned According to UNCTAD estimates for 1989 India produced around 10 per cent of world agricultural output, but her share in world trade in agricultural commodities was only around 0 6 per cent Moreover, as Table 1 shows, India s involvement in world agricultural trade has been declining during the past 25 years, whether this is measured in comparison with world agricultural trade, India's international trade or her GDP

It is evident from the table that both Indian imports and Indian exports of agricultural commodities have declined as a share of world trade, of India's own total trade, and of her national income These shares have declined more than the share of the agricultural sector or of foreign trade in India's GDP And this trend has been much more marked for imports than for exports The reason is that the pattern of Indian agricultural growth since the onset of the 'green revolution' in the mid-1960s has been dominated by considerations of food security and self-sufficiency—with priority given to reduction, through increased domestic produc-

tion, of the large domestic cereals supply gap which had emerged in the 1960s. Success in this import substitution endeavour has been the main reason for the relative decline in India's imports of agricultural commodities. The reason why exports have also fallen relatively, albeit at a lower rate, is that the 'green revolution' while reducing the supply deficit of foodgrains did not lead to a generation of exportable surpluses, and because the emphasis on cereals in national agricultural policy distracted policy-makers from paying greater attention to the long-run problem that output growth of India's staple export crops has failed to keep up with the growth of domestic demand.[4]

Thus the dwindling share of India in world agricultural trade reflects not so much a failure of agricultural production as the result of a deliberate pursuit of import-substitution in order to achieve a perceived need to attain the objective of domestic food security. Indeed, as Table 2 shows, India's share of world output of major agricultural crops has, on the whole, risen or remained constant during the period—the relative performance here being the strongest for wheat, the prime 'green revolution' crop, and rather weak for certain export crops, notably tea. Moreover, the table also reveals that world trade in a number of crops forms a rather small share of world output (the exceptions being tea, coffee, rubber, cotton and wheat), and consequently that, although Indian trade is small in relation to world trade, Indian output is large in relation to the latter. This is particularly the case for jute, rice and groundnuts, but is also true for a number of other crops such as wheat, sugar, cotton, tobacco and a number of fruits and vegetables, all of which are of crucial importance for India's agricultural economy. The implication of this is obvious. Although India's trade in agricultural commodities is at present small, an opening up of India's large (and currently closed) agricultural sector to world trade may have an extremely large effect on the nature of the world equilibrium in terms of prices and, subsequently, outputs.

Of course, the fact that only a small part of Indian agricultural output currently enters world trade does not by itself mean that agricultural trade liberalisation by India would lead to large changes in world relative prices. For example, this proposition would not hold if Indian domestic relative prices were already close to world relative prices, because after all it is possible that even with free trade a large country such as India would account for a much smaller share of world trade than of world output. It is necessary therefore to compare domestic prices with world prices.

Indian and World Prices: A Comparison

Any comparison of Indian agricultural prices with 'world' prices is an exercise fraught with a number of problems. In part, this arises from the fact that it is difficult to be sure that the commodities being compared are of similar quality. But the more difficult problems arise because, given the imperfect nature of world agricultural trade and the large transport costs relative to commodity prices, prices of similar goods vary considerably over time and space. Nonetheless, since some comparison is necessary, an attempt is made here although it must be reiterated that the results are by their very nature rather crude and tentative.

The easiest price comparison is that between the domestic wholesale price index and the indices of average unit values in international trade. This permits the generation of a long enough and comparable time series but has the obvious problem that since indices rather than actual prices are being compared, it merely illustrates the relative movements of domestic and border prices without giving any indication of the absolute magnitudes involved. Figures 1 and 2 present this comparison separately for India's exportable and importable agricultural commodities for the period from 1960-61 to 1990-91. Here, importables are defined conservatively to include only wheat and edible oils, while exportables are defined more widely to include tea, coffee, spices, tobacco, raw cotton and oilcakes. In both cases the unit value indices (of exportables and importables respectively) have been converted to a 1981-82 base to make them comparable with the domestic wholesale price index and the weights used to aggregate across commodities are also those implicit in the domestic wholesale price index.

These comparisons show that the divergence between border and domestic price movements has increased in recent years which is much more marked for importables than for exportables. In case of exportables, the domestic and border prices grew more or less at the same rate (though with somewhat greater fluctuations for border as opposed to domestic prices) until the mid-1980s, since when domestic prices have risen at a significantly lower rate than the unit export values. For importables, there was a broad correspondence in the movements of domestic and border prices until the early 1970s but since then the two have had widely divergent year-to-year movements. During the mid-1970s the border prices of importable agricultural goods increased much more than the domestic prices, but since 1978 domestic prices have increased much faster than border prices, though again with somewhat less variability around the trend. In sum, border and domestic prices of agricultural commodities have tended to diverge more in recent years, while border prices have tended to fluctuate more around their trend than domestic prices. Moreover, it is evident that during the 1980s the changes in domestic relative prices, as compared to those in border prices, have tended to favour importables as against exportables among agricultural commodities. Thus, these price index comparisons confirm three points noted in the previous section. First, that, given its imperfections, the world market in agricultural commodities is less stable than the Indian domestic market. Second, that the import-substitution pattern noted for agricultural output and trade is matched by the relative price movements. Third, with domestic prices of importables increasing faster than border prices, and those of exportables increasing slower, there is some evidence that India's domestic agricultural relative prices were increasingly diverging from world price relatives during the 1980s; thus, by 1990 they were sufficiently different from world prices so that an opening up of Indian agriculture to freer international trade would have repercussions on both world trade and Indian price relatives.

In interpreting the above indices, it must be remembered that these are all indices of rupee prices. Since the rupee depreciated considerably over the period, particularly during the 1980s when it more than halved in value *vis-a-vis* the US dollar, these indices give a misleading impression of dollar prices. In fact, during the 1980s in India, both domestic and border prices of agricultural commodities fell in dollar terms. World price indices for agricultural commodities available from the World Bank and UNCTAD also show a sharp adverse movement against such commodities in their terms of trade with manufactured goods. According to these sources, between 1980 and 1990, in dollar terms, agricultural commodity prices fell by around 30 per cent while prices of manufactured goods rose by over 35 per cent. Indeed, an important feature of the 1980s is that whereas the terms of trade between agriculture and manufacturing moved against agriculture in the world economy, it moved in favour of agriculture in India. This has sometimes been interpreted as suggesting that India's farm price support policies pushed up domestic farm prices much faster than world prices. But, in fact, because of the continuous depreciation of the rupee during this period, there is little difference in the rates of growth of domestic and border agricultural prices when exportables and importables are aggregated and expressed in terms of a common currency.

The real reason for the differential movements in the agriculture-manufacturing terms of trade was the slower growth in India of manufacturing prices. This is brought out in Figure 3 which plots the Indian wholesale price index for manufactures against the World Bank's price index (converted to rupees) for manufactured exports from developed to developing countries. These two indices moved together till the mid-1980s, but thereafter the world index moved up much more sharply, mainly because while profit mark-ups rose in the West, these remained more or less constant in India.[5]

Clearly, during the 1980s, when most developing countries were forced into 'structural adjustments', not only did dollar prices of agricultural commodities fall sharply because these countries had to export more (or import less) of agricultural commodities (usually by squeezing consumption through devaluation led domestic price increases), they also had to pay higher prices for manufactured imports because reduced protection in developing countries enabled manufacturers in developed countries to increase their mark-ups.[6]

Since this is precisely the prospect that India faces in coming years, it is necessary to extend the price comparisons to a more detailed consideration of particular crops and also to consider differences in absolute price levels, rather than just differences in the movement of price indices. For this purpose, Figures 4 to 18 plot the Indian and world prices for 15 selected crops during the period from 1980 to 1990. The Indian prices are commodity specific annual averages of the absolute wholesale price quotations used to compile the wholesale price index, while the world prices are the UNCTAD reference prices published in the *UNCTAD Monthly Commodity Price Bulletin*, converted to rupees per quintal using current exchange rates.

TABLE 1 INDIA'S INTERNATIONAL TRADE IN AGRICULTURAL COMMODITIES

Year	As Per Cent of World Agricultural Trade		As Per Cent of India's Total Trade		As Per Cent of India's GDP	
	Imports	Exports	Imports	Exports	Imports	Exports
1966	2.1	1.3	37.2	34.2	2.8	1.5
1970	0.9	1.2	31.4	35.2	1.2	1.2
1975	1.1	1.3	27.7	41.9	1.9	2.0

1989	0.4	0.8	7.8	18.3	0.6	1.4

Source: UNCTAD, *Commodity Yearbook 1991*

These latter prices are quotations at major centres of world trade for the commodities concerned, but are something of a mixed bag because while these are FOB quotations at major producing centres for wheat, rice, sugar, jute, rubber and pepper, for the remaining crops they are CIF quotations at major consuming centres. Because of this comparisons need to be made with care since transport costs are being ignored, and for certain crops, notably tobacco and bananas, differences in quality may also exist although attempts have been made to compare like with like.[7]

On the basis of these comparisons it can be said that during the 1980s Indian prices were generally lower than world prices for rice, cotton, coffee, tobacco, pepper and bananas; they were unambiguously higher than world prices for sugar, rubber and oilseeds (including coconut but with the possible exception of groundnut) and were almost identical with world prices for tea and jute. For wheat and maize, Indian prices were such that considering the spread of transport costs they were always higher than world prices on an exportable basis but sometimes lower on an importable basis. In general it may be said that Indian prices were lower for a whole set of crops which are currently exported and also for some fruit a[illegible]tables currently not traded, but high[illegible] crops in whose case a deliberate policy [illegible]mport substitution has been followed [illegible]ntly and for which recent growth [illegible] output have been above average.[8] Mo[illegible] although movements in Indian and [illegible]rld prices were, if any thing, generally correlated positively with each other [illegible] also evident that the degree of such correlation was extremely low except for tea, jute, pepper and cotton,[9] and that in most cases the world prices showed greater [illegible]ability around the trend than the corresponding domestic prices for India.

These absolute price comparisons, though indicative, are however of limited usefulness in gauging the repercussions of possible trade liberalisation because changes in the exchange rate can alter the list of crops for which Indian prices are lower or higher than world prices. Indeed the substantial depreciation of the rupee in the period since mid 1991, has made many crops, notably wheat, relatively cheaper in India than abroad. And since further exchange rate adjustments are likely, it is preferable to concentrate on price comparisons which do not depend upon the choice of the exchange rate.

The obvious measure from this point of view is to compare price relatives rather than absolute prices. Table 3 sets out the 1980-1990 average Indian and world relative prices for the selected crops, in all cases taking wheat as the numeraire. The choice of wheat as numeraire follows from the fact that this is a staple crop in India and for which, unlike rice, world trade is significant as a proportion of world output. Moreover India is currently just about self-sufficient in wheat, without much export or import, and the Indian price is currently within the band of transport cost differentials so that in free market terms there is little private incentive to trade, and this situation is unlikely to change radically in the near future. The table also gives the coefficient of variation of these relative prices for India and the world.

What this table shows is that relative to wheat most crops are cheaper in India, the major exceptions being sugar, coconut and rubber. Maize, soybean and groundnut have more or less the same relatives in India as in the world. Thus, freer trade would lead to an increase in the relative domestic prices of most crops. The most significant among these is rice in which, at present, world trade is marginal. Also with the exception of tea, jute and soybean, the coefficient of variation of prices is less in India, so that freer trade is likely to lead to greater price instability in the Indian domestic market.

These crop price comparisons need to be supplemented by a brief discussion of input prices. This is important because along with liberalisation, reduction of subsidies on inputs is part of the agenda both in the domestic stabilisation and structural adjustment programme and in GATT. There are broadly two issues involved here. First, there is the question of whether reduction of these subsidies will affect different crops differently and, if so, how will relative profitability change. Secondly, to the extent that subsidy withdrawals reduce output, they will raise domestic prices, hence affect international competitiveness and it is necessary in this context to ask how input prices in India compare with elsewhere.

In India, the main input subsidies received by agriculture relate to fertiliser, electricity and irrigation, and the incidence of such subsidies varies considerably across crops. By far the most subsidised crops in terms of the incidence of budgetary subsidies as a

Sources: World prices are UNCTAD Reference Prices as given in *UNCTAD Monthly Commodity Price Bulletins* (various) and Indian prices are annual averages of quotations of absolute wholesale prices.

percentage of cost of production are sugarcane and wheat, with rice and cotton receiving less subsidy than average [10] As a result, the effect of subsidy withdrawals on relative profitabilities would be broadly in the same direction as that of trade liberalisation It would cause domestic prices to go up generally, along with a reduction in the relative profitability of sugarcane and with relative increases in the profitability of growing rice and cotton

As to comparing Indian prices of inputs with those in the rest of the world, the only subsidised input which is tradable is fertiliser Indian fertiliser prices are subsidised, and the fertiliser subsidy is the largest subsidy item in the central government budget However, the budgetary subsidy overstates the extent of economic subsidy given to farmers using fertilisers Defining the economic subsidy as the difference between the import parity price (including transport and distribution costs) and the price paid by the farmer this was only around half of the budgetary subsidy during the 1980s, the remaining part being in effect a protective subsidy to domestic fertiliser manufacturers Moreover, the world fertiliser market is also extremely imperfect with most countries subsidising their farmers and with trade prices higher and more volatile than the domestic price in most countries As a result, the rice (and wheat) price of fertilisers in India are in fact higher than in most major agriculture producing countries and unilateral subsidy reduction is likely to increase further this comparative disadvantage of the Indian farmer and reduce the already internationally low rates of fertiliser application [11] Moreover, since current Indian fertiliser production is large in relation to world fertiliser trade, and subsidy elimination would depress this production significantly, a sizeable increase is likely in the volume and hence price of imported fertilisers

Implications and Consequences of Unilateral Liberalisation

Following the discussion above in this section it is necessary to draw out the implications of unilateral liberalisation of agricultural trade by India Since India is a large world producer and consumer of agricultural commodities, such liberalisation is likely to have an impact on world prices And, because agriculture is such a large part of the Indian economy, supplying wage goods and raw materials to other sectors, price repercussions in agriculture would have a significant impact elsewhere in the Indian economy Given these pervasive effects, the full effects of such liberalisation are difficult to enumerate, let alone quantify, even with the aid of large Computable General Equilibrium models The discussion here is not based on any such model, and cannot therefore make any precise quantitative claims However, the important qualitative issues can be identified and the likely direction of the ensuing changes indicated

(a) Terms of Trade

Given that India accounts for a significant share of world output, and that a relatively small proportion of world output enters into world trade for most agricultural commodities, a larger participation by India in such world trade is bound to worsen its terms of trade

This is particularly the case for exportables such as rice and cotton In the case of rice with total world trade currently less than a fifth of Indian production and with the potentially large east Asian markets currently closed through quantitative restrictions, there is likely to be a very large fall in world prices even if India attempts to increase her exports by a relatively small share of domestic production For raw cotton, too, a drop in export price can be expected although the price implication may be somewhat less because India's output is not as large a proportion of world trade as in the case of rice, but here there is the further implication that large raw cotton exports by India would hurt the international competitiveness of India's important cotton textile industry by pushing up its domestic costs while reducing the costs of its competitors abroad

Similarly, an increase in the prices of importables is expected to follow any significant increase in the volume of imports Thus, if the existing protection to oilseeds is removed and oilseed production thereby reduced, there may be a significant increase in both the volume and the price of such imports Even more significant may be the implication for sugar of which India is now the world's largest consumer and whose domestic prices are currently almost double world prices Freeing sugar imports (currently banned as a consumer good) may lead simultaneously to large imports and a considerable hardening of world prices A similar effect is expected for coconut and, to a somewhat lesser extent, for rubber

(b) Balance of Trade

In view of the adverse terms of trade implications of trade liberalisation the consequences for the balance of trade would depend largely on what happens to trade volumes In the medium term, a worsening in the balance of trade may be expected because the trade policy changes so far have been asymmetrical with agricultural imports liberalised but without a corresponding degree of liberalisation of agricultural exports For reasons given above, this trend is likely to be accentuated even more if liberalisation extends to the import of sugar and edible oils and this occurs before export increases materialise

However, even if exports are liberalised, export earnings may not improve much without significant further devaluation This is because in the case of rice, the combination of an expected world price decline following exports and the fact that domestic price elasticities (for both demand and supply) are small is likely to mean only a small increase in the exportable surplus and an even smaller increase in export revenue [12] In order to generate sufficient export volumes without waiting for corresponding output increases which are likely to be slow, it would be necessary to squeeze consumption through a devaluation induced rise in prices For cotton there may well be a fairly quick increase in the earnings from raw cotton exports, but in the absence of devaluation this may well be swamped by a contraction in exports of cotton manufactures More generally with prices of cereals and textiles increasing, the cost of living of industrial workers is likely to go up despite any fall in the price of sugar and oilseeds and, consequently wage costs are likely to increase, requiring further devaluation induced real wage reductions to maintain international parity

In fact, the real export potential from agriculture may not lie in these major crops at all but in the development of horticulture and food processing And, in the case of these, it is not at all clear that current trade policy restrictions are the major handicaps at present The requirements here are marketing, technology and quality control and besides much improved infrastructure the supply of these would probably require added incentives for transnational firms

(c) Domestic Prices and Food Security

Since food and clothing prices are likely to increase with agricultural trade liberalisation even without devaluation and since further devaluation is likely to become necessary to keep the current account deficit in the balance of payments within manageable proportions an increase in the degree of openness of the economy following liberalisation is bound to increase domestic prices in absolute terms, and also lead to relative price changes which hurt the poor more than the rich or even the non poor

Also as has already been noted world food prices are considerably more volatile than Indian prices at least thus far and therefore price instabilities are likely to increase unless some tariff or non tariff wedge between world prices and domestic prices is retained An implication of this is that it would be inappropriate to replace the current buffer stock policy by one where international reserves are built up and reliance put only on trade to even out fluctuations due to weather [13] Moreover it is almost certain that reduced self sufficiency and reduced gov-

ernment procurement may erode the ability of the state to carry out the market intervention needed for an adequate buffer stock policy, and to avoid or mitigate, through public distribution, the possibility of sudden episodes of high food price inflation following unforeseen local shortages. Furthermore, with India entering a period where balance of payments problems are likely to become more severe in the medium term, and pressures on the exchange rate of the rupee correspondingly greater, currency speculation could result in sudden devaluations leading, in the presence of free agricultural trade, to possible periods of rapid and unanticipated food price increases. In a country where 40 per cent of the rural workforce is employed as casual labour, with highly seasonal employment and with extremely low degrees of wage indexation, the principal victim of liberalised agricultural trade may well be India's acclaimed ability, developed assiduously over the past quarter of a century, to prevent widespread famines despite large underlying poverty.

(d) Distribution of Income and Comparative Advantage

Clearly, as with any liberalisation, there will be gainers and losers from liberalisation of agricultural trade in India. The most obvious way of looking at this is to say that the gainers will be the producers of crops such as rice and cotton which are currently priced below world prices and consumers of goods such as sugar and oilseeds which are currently priced above world prices. And, simultaneously, producers of oilseeds and sugar will lose along with consumers of rice and cotton. But this way of looking at the distributional impact has merits as well as weaknesses.

On the positive side, it focuses on the fact that there might be fairly large redistribution of income across regions. Clearly, the predominantly rice growing regions in the south and east would gain, and so would cotton growing regions in the west. Rice and cotton re grown also in the north but the gains here re likely to be less, in part because here these crops are grown almost entirely under irrigated conditions with much more intensive fertiliser use and, therefore, the adverse effects of any simultaneous cuts in input subsidy are likely to be larger. The main losers will be growers of sugarcane and oilseeds, the former concentrated in irrigated parts of the north and the west and the latter in the dry regions of Peninsular India. But, of these, the loss is likely to be greater in the poorer dry regions growing oilseeds than the rich irrigated sugarcane regions because the scope of diversifying into other high valued crops is less.[14]

Thus, the regional impact is likely to have both equalising (poor rice growing regions gaining) and unequalising (poor dry regions growing oilseeds losing) features. But it is important to recognise that an weakness of this way of looking at the problem is that this glosses over the fact that it is precisely the rice growing regions which currently have the highest concentrations of poor casual agricultural labourers who will lose most if their wages do not keep up with rice prices and if their employment also fails to grow. Unfortunately, the available evidence does not suggest that the reshuffling of resources over crops consequent upon trade liberalisation will in itself increase agricultural employment without further investment and/or a modicum of land redistribution away from the rich.[15] Of course, it is possible that if agriculturists in a region become generally richer, then investment may pick up and more opportunities become available for the poor in non-agricultural activities. But, besides the historical fact that such 'trickle-down' has not been adequate in the past, there is the further problem that it is precisely these regions which are currently most lacking in infrastructure, and cutbacks in public investment, subsidies, and credit, as a result of the stabilisation policies being followed, may impede the 'catching-up' process which appears to have begun recently in some parts of the poor rice-growing eastern region, particularly West Bengal.

(e) Output and Employment

Notwithstanding these arguments on food security and equity, it is sometimes argued that trade liberalisation is on balance desirable because of its supposed positive impact on agricultural output and employment. This impact, acting mainly through the income and incentive effects of higher agricultural prices consequent to liberalisation, is dependent entirely on whether prices do increase (and the reverse will generally be the case for important commodities like edible oils and sugar) and on the likely supply response of agriculture. The latter will, of course, depend on the degree of price-responsiveness of agricultural output, which though high for certain individual crops is low for aggregate output, but there is also much else. Available studies show that more than 50 per cent of increments in agricultural output in India in recent years are attributable to shifter variables, such as technology and infrastructure, which are unlikely to be responsive to incentives or investment in the private sector.[16] These considerations, which emphasise the fact that non-price factors (particularly technology and infrastructure) are likely to be more important than the price consequences of trade liberalisation, apply with even greater force to the argument that a liberalisation of trade generally (i e, not just in agricultural commodities) would boost agriculture by removing the 'bias' against it.

While greater attention than in the past to India's comparative advantages within agriculture is certainly necessary, it does not necessarily follow that India's long run comparative advantage lies in agriculture given her high man-land ratio and limited water resources. Moreover, it is fairly clear that public investment (which in the Indian context crowds-in rather than crowds-out private investment) is critical in order to reap the benefits of comparative advantage, and financing of such investment would require some bias against agriculture at least as long as the tax system remains dependent entirely on non-agriculture.

As far as employment is concerned, the effects on direct agricultural employment would run in the same direction as output. But it is important to note that recent trends suggest that the elasticity of employment with respect to output is declining rapidly so that the direct employment potential of the agricultural sector is becoming less, particularly in pockets of high land productivity, and it is the secondary effects of higher agricultural output on employment which may be more important. In this context, it may be noted that agricultural trade liberalisation may have negative effects because both sugar and oilseeds production, which are expected to decline, have significantly larger industrial linkages than most other crops. And, employment in the cotton textile sector is also likely to be affected adversely, despite higher raw cotton production, because, as discussed earlier, freer trade is likely to reduce the international competitiveness of this industry. It is possible of course that more positive results may follow if trade liberalisation causes a massive take-off in fruit and vegetable production and processing. But, as mentioned earlier, this will depend on the development of infrastructure and export market links and, in any case, does not really require that agricultural trade be liberalised generally. The most significant effect of the latter on employment, both agricultural and non-agricultural, may well be through its other consequence, also discussed earlier, that higher prices of wage goods relative to capital goods will cause relative factor price movements which lower employment unless large declines real wages are allowed.

These conclusions about the consequences of unilateral trade liberalisation are borne out by results of simulations done recently with Computable General Equilibrium models. Such models, as applied to Indian agriculture, are all rather flawed because they make the 'small country' assumption that world prices will remain unchanged when India liberalises agricultural trade. Not surprisingly, therefore, these models predict sharp increases in export earnings (and in imports) following liberalisation. But, significantly, agricultural value added is predicted to rise marginally at best and even falls in some variants. The exact outcomes

depend on whether trade liberalisation is limited to unprocessed crops or extends to all commodities. But even in the latter case, when agricultural GDP does rise, only the large farmers benefit, with the urban and rural poor worse-off because of higher food prices.[17]

VI

Uruguay Round, Multilateral Liberalisation and Indian Agriculture

The multilateral trading system, embodied in the General Agreement on Tariffs and Trade, is, in principle, applicable to international trade in all goods but, in practice, differentiates between manufactured goods and agricultural commodities. For the past four decades, trade in agriculture has, *de facto*, been excluded from the GATT system.[18] First, there is no discipline on domestic support, with the exception of a non-operative clause for consultations in the event of serious prejudice. Second, in the sphere of export subsidies, there is a "virtual" waiver or exception for agriculture specified in Article XVI on subsidies. Third, in the realm of imports, for agriculture there is a departure from the commitment to eliminate quantitative restrictions set out in Article XI, for foodstuffs, critical raw materials and, in general, for stabilisation measures in the agricultural sector.[19] Taken together, this has meant that trade in agriculture is simply not subject to the regime of international discipline embodied in the GATT. The Uruguay Round of multilateral trade negotiations seeks to bring trade in agriculture under GATT discipline. The outcome is not definite or settled but the Dunkel Text provides a clear pointer to the probable changes on the horizon.[20]

It is important to note that the Dunkel Text on agriculture goes far beyond traditional GATT concerns in the sphere of export subsidies or import restrictions and extends to the whole gamut of domestic economic policies in the sphere of agriculture.[21] Thus, the Dunkel proposals are not confined to border measures that may affect the movement of agricultural goods across national boundaries, but constitute a fundamental departure from the traditional paradigm of the GATT to introduce discipline on intra-border economic regimes which would inevitably mean a transgression of sovereign economic space. In outlining the essence of the Dunkel Text on agriculture, therefore, it would only be appropriate to draw a distinction between old GATT concerns and new trans-GATT concerns.

The stipulations on export subsidies are straightforward insofar as trade in agriculture is to be progressively subjected to GATT discipline. The new regime for subsidies on exports is not to be implemented overnight. Over a period of six years, the subsidised volume of exports is to be reduced by 21 per cent while the budgetary support for export subsidies in terms of value is to be reduced by 36 per cent.

The stipulations on the import regime, as also the plans for liberalisation of trade in agriculture, are more elaborate and complex. First, imports, that is market access, can be restricted only for specified reasons such as balance of payments considerations and not for general protection of domestic agriculture. Second, such restrictions on imports must be price-based alone, so that all non-tariff measures including quantitative restrictions would have to be converted into their tariff equivalents, with a commitment to reduce these tariffs by 36 per cent over a period of six years. Third, in addition, countries must provide a guaranteed minimum market access to imports which would be at least 3 per cent of domestic consumption to start with and would be expanded to reach 5 per cent over a period of six years; in the case of developing countries, the minimum market access commitment would be less, at two-thirds of what is specified for others, i e, 2 per cent to start with and then increasing to 3.33 per cent over a longer period of 10 years; it is also stipulated that the market access so provided cannot, at any stage, be less than actual average annual imports during the period 1986-1988.

The limits placed on permissible government domestic support for agriculture seek to subject domestic economic policies *vis-a-vis* the agricultural sector to an international regime of discipline. The proposals embodied in the Dunkel Text distinguish between two forms of domestic support for agriculture that can be extended by governments. The measures that can be retained are categorised as green and include support for depressed areas, the environment, the infrastructure, extension services, plant protection, R and D activities and so on; in addition, subsidies to low-income and resource-poor farmers would be allowed. The measures that are to be brought within the purview of the GATT discipline are categorised as amber and include all other forms of support to agriculture that benefit producers in the form of lower prices for inputs or higher prices for outputs. The direct budgetary support in the form of expenditure disbursed and the indirect budgetary support in the form of revenue foregone must be included in computing the aggregate measure of support. The support implicit in any divergence between domestic prices and world prices of inputs purchased, or outputs sold, by the agricultural sector is also to be taken into consideration. For developed countries, domestic support to agriculture is subject to a maximum limit of 5 per cent of the value of output in each product and in the aggregate, but for developing countries the maximum limits are higher at 10 per cent. In cases where domestic support to agriculture exceeds the stipulated ceilings, such domestic support is to be reduced from the existing level, by 20 per cent over a period of six years in developed countries and by 13.33 per cent over a period of 10 years in the developing countries.[22]

The proposed multilateral liberalisation of trade in agriculture and the introduction of an international regime of discipline for domestic support to agriculture would obviously influence the output of, the trade in, and the prices of, agricultural commodities in the world economy. This, in turn, is bound to have significant implications and consequences for the agricultural sector in India. In a general equilibrium world, characterised by high degrees of uncertainty and interdependence, precise or quantitative analysis is exceedingly difficult if not impossible. It is, however, possible to identify the important issues and sketch likely outcomes or plausible scenarios. More definitive analysis can only be based on elaborate research which is beyond the scope of this essay. The issues consideredbelow are illustrative rather than exhaustive.

(a) World Prices

The culmination of the Uruguay Round of multilateral trade negotiations, in line with the Dunkel Text, would mean that trade in, and domestic support to, agriculture would be subject to GATT discipline. The most important consequence, perhaps, would be a progressive withdrawal of agricultural subsidies in the industrialised countries, particularly in the European Community, and the consequent increase in the world prices of such subsidised commodities. To begin with, a reduction in subsidies would lead to a *pari passu* increase in prices but, over time, the price responsiveness of supply and demand would moderate the increase in prices.[23] In any case, the benefits would accrue to countries that export these commodities while the costs would be borne by countries that import these commodities. In principle, then, the benefits and the costs to India would depend upon whether it is a net exporter or a net importer of such agricultural commodities.

It is important to recognise that the cuts in agricultural subsidies mandated by the Uruguay Round would, by and large, raise the prices of temperate crops. The prices of most tropical products, which constitute India's traditional agricultural exports and where India has a revealed comparative advantage, would not be influenced by the outcome of the Uruguay Round. Thus, the impact would depend upon India's trade in temperate climate agricultural commodities. The withdrawal of subsidies in Europe would raise the world prices of temperate crops such as wheat, oilseeds (hence edible oils), and sugar-beet (hence sugar), just as it would raise the world prices of dairy products, or of

temperate fruits and vegetables. The withdrawal of subsidies in Japan would raise the world prices of rice. India would be worse off in so far as it is a definite net importer of oilseeds or edible oils. India would be better off insofar as it can become a major net exporter of wheat, rice, sugar and livestock products. It is not clear, however, that substantial gains would materialise. For one, given the demographic pressure on land, the neglect of agricultural investment and existing structural imbalances, it is unlikely that India can transform itself rapidly from bare self-sufficiency to emerge as a large net exporter of cereals, whether wheat or rice. For another, should this happen, it would be associated with a deterioration in the terms of trade, inasmuch as India's exports may be large enough to dampen world prices, and an escalation in domestic prices of cereals, which would inevitably hurt the poor.[24]

(b) Subsidies and Support

It has been estimated by the ministry of commerce that the aggregate measure of support to agriculture in India is 5.2 per cent, and would be even lower if the exemptions allowed for low-income resource-poor farmers were to be taken into account.[25] As this is less than the 10 per cent *de minimis* provided for in the Dunkel Text, it appears that subsidies need not be reduced. However, the basis of these computations has not been made public and there remains the possibility that these underestimate the degree of support since cross-subsidisation of agriculture by public utilities outside the budget is common in India. Given the present compulsions to phase out such cross-subsidisation and make subsidies more transparent in the budget, it is possible that budgetary support for agriculture may rise over time. If, as a consequence, domestic support exceeds the *de minimis* level, the Dunkel Text would have definite implications, especially as the *de minimis* percentage for domestic support is itself not given once-and-for-all and may be reduced in future negotiations. The explicit and implicit subsidies provided on inputs for the agricultural sector, whether on fertilisers, irrigation, power or credit, would then constitute part of the aggregate measure of support that would be subject to discipline. Hence, regimes of subsidies which do not differentiate between farmers by size of holding, whether provided openly by Central or State governments or through the medium of concessional pricing by public utilities would be open to question.

(c) Public Distribution System and Government Intervention[26]

The proposals embodied in the Dunkel Text would impose two basic constraints on the public distribution system as it exists in India. First, it would mean that the government can buy foodgrains for its buffer stocks only at market prices and under no circumstances at less than market prices. Second, it means that subsidised food, below market prices, cannot be made available to all domestic consumers but would have to be limited to targeted groups in the population below a nutritional minimum. These limitations would erode the basis of the present public distribution system and inevitably limit its further expansion. We must, of course, recognise that the public distribution system in India is not without its flaws. It is not confined to the poor but extends to the non-poor. It does not reach out to all the poor, particularly in rural India. Yet, it is an important element of the food security system in India which would be at risk, because subsidies for consumers of food, as also the method of financing such subsidies, would be subjected to an international discipline.

The capacity of the government to intervene in the market, in keeping with the needs of food security, would be significantly circumscribed. Thus far, it has been possible for the government to build up buffer stocks of foodgrains, sometimes through procurement in the domestic market below market prices and sometimes through imports canalised through state trading organisations. The inventories so acquired, by the Food Corporation of India, for the public distribution system are, on occasions, released in the domestic market to dampen prices or inflationary expectations. The conclusion of the Uruguay Round in accordance with the Dunkel Text would almost certainly disrupt this mechanism. It would no longer be possible for the government to procure foodgrains from farmers below market prices. It would no longer be possible for the government to decide on imports, whereas decanalisation followed by tariffication would raise domestic prices of such imports. The possibilities of market intervention by the government to stabilise food prices, hence the general price level, would clearly be curbed by the proposals embodied in the Dunkel Text.

(d) Intellectual Property Rights and Agriculture

The implications of the Uruguay Round for the agricultural sector in India are not confined to the Dunkel Text on agriculture. The Dunkel Text on trade related aspects of Intellectual Property Rights excludes from patentability "plants and animals other than micro-organisms, and essentially biological processes for the production of plants or animals other than non-biological and microbiological processes", but stipulates that countries "shall provide for the protection of plant varieties either by patents or by an effective *sui generis* system or by any combination thereof".[27] There is, at least as yet, no compulsion to introduce patenting of seeds. In the absence of patents, however, there is an obligation to introduce a complete legal system that would protect new plant varieties in the interest of plant-breeders. The Dunkel Text provides no definition of such a *sui generis* system, but it is widely presumed that the International Convention for the Protection of New Varieties of Plants, termed the UPOV convention, should provide a point of reference or guidance. The system for protection of plant varieties implicit in the original version, UPOV 1978, was confined only to production for commercial marketing in designated species, so that farmers could retain a part of their produce to be used for sowing in the following season. The later version, UPOV 1991, is far more stringent and has moved the system of protection of plant varieties closer to a patents system. There are restrictions on the rights of farmers to retain produce for their own use as seed in the next season, while the coverage has been extended from designated species to the entire plant kingdom. At this stage, it is not clear whether the new system for the protection of plant varieties would be shaped by UPOV 1978 or UPOV 1991; the latter would obviously be more exacting from the viewpoint of farmers in developing countries.[28] It is clear, however, that while a *sui generis* system may allow some relief from immediate patentability for plant varieties developed out of purely biological processes, full patent protection will have to be extended to developments flowing from non-biological or microbiological processes, such as in the realm of bio-technology.

These provisions for the protection of intellectual property rights have two important implications for Indian agriculture. First, access to new technology, embodied in high-yielding or disease resistant varieties, would become more difficult in terms of both availability and price. The reason is simple. Once the benefits of knowledge are privatised, and not in the public domain, new seeds or new technologies would not be easily accessible in the rural hinterland and even where these become available the cost of acquisition would be high. This is especially so because, with full patentability extended to micro-organisms and also to non-biological and microbiological processes relating to plants and animals, India's publicly funded, and so far fairly successful, agricultural research infrastructure would find it difficult to keep pace with new developments elsewhere, particularly in the promising area of bio-technology. Secondly, even if new technologies do become accessible, their diffusion across the rural hinterland would become more difficult and would inevitably slow down. This is because farmers would not be able to adapt, propagate, sell or exchange seeds, even if seeds can be retained for their own use, without adding significantly to transaction costs. In an economy such as India, where a large proportion of seed requirements in agriculture are met through

exchange or sales transactions between farmers, such a regime would inevitably constrain the quick dissemination and spread of new seeds and varieties. Taken together, these implications for access to and diffusion of new technology will affect adversely the rate of productivity growth in Indian agriculture, both absolutely and even more so relative to agricultural productivity in the developed countries. Thus, developing countries, such as India, may or may not gain from the transient increase in world agricultural prices consequent to the once-and-for-all subsidy reduction in the developed countries proposed in the Dunkel agriculture text, but they are almost certain to lose, as a result of the TRIPS provisions, in the more long-run outcomes in international trade where differences in technological capabilities count for far more than static comparative advantage.

(e) Sequence of Liberalisation

The preceding discussion suggests that the impact of the Uruguay Round on Indian agriculture would not be limited to the volume, the prices or the value of trade in agricultural commodities. It would extend much beyond trade into domestic spheres such as subsidies and support for agricultural production, the public distribution system, market intervention by government and access to and diffusion of technology. This impact may, in fact, turn out to be far more complex if we consider the probable changes in the international context in conjunction with the actual trade policy reform in the national context. The problems of analysis may be complicated further if conditions imposed in medium-term structural adjustment programmes, negotiated with the multilateral financial institutions, lead to significant policy changes in the sphere of agriculture. In terms of temporal sequence so far, unilateral trade liberalisation, induced in part by such conditionalities, has preceded multilateral trade liberalisation contemplated in the Dunkel Text; it is also possible that some elements of the multilateral obligations mandated by the Uruguay Round, particularly those related to trade liberalisation and domestic subsidies, may be implemented on an unilateral basis as part of the programmes negotiated with the IMF or the World Bank. This sequence has two important implications. First, the unilateral liberalisation of trade in agriculture implies that the significant reduction of barriers to trade has simply not been used as a quid pro quo, or a bargaining point, in the multilateral trade negotiations. Second, if unilateral liberalisation is followed by multilateral liberalisation after a time lag, it would have an impact on trade volumes, import prices and domestic production that deserves attention. Consider the example of oilseeds and sugar where domestic prices are, at present, significantly higher than world prices. To begin with, unilateral trade liberalisation would expand the volume of imports and contract the domestic production of these importables. Land under oilseeds and sugarcane may be switched to alternative uses, while some processing capacities for edible oils and sugar may have to be shut down. Insofar as the small country assumption is not valid for India, world prices of these commodities may rise, so that the increase in the import bill would be greater than the increase in import volume. Some time later, multilateral liberalisation would raise the world prices of these commodities further. This may, in turn, through increased profitability, revive the domestic production of such importables in the agricultural sector. Land use may once again shift to oilseeds and sugarcane, just as processing capacities for edible oils and sugar may be needed once again. Actual outcomes are, of course, impossible to predict, but it is worth thinking about the stop-go implications of such an intuitively plausible scenario.

VII
Concluding Observations

It is exceedingly difficult to analyse the implications and the consequences of trade policy reform in the national context and multilateral trade policy changes in the international context for Indian agriculture. This is so for many reasons. First, domestic trade policy reform is a process that has begun but is by no means complete; even if it were, the impact of the trade policy regime on the agricultural sector cannot be easily separated from that of other factors and developments in the economy. Second, the outcome of the Uruguay Round of multilateral trade negotiations is by no means definite; indeed, the conflict between the US and the European Community may lead to significant compromises in the Dunkel Text on agriculture; even when the outcome is known, however, it would be difficult, *ex hypothesi*, to assess its impact on world output, world trade and world prices of agricultural commodities. Third, the longer term impact on Indian agriculture would be determined by an interaction of the changes in national trade policy and international trade policy; this inter-dependence makes the task of the analyst even more complex.

It is essential to recognise these problems. But the complexities and uncertainties should not mean that such an important set of issues is left unexplored. Indeed, the analysis in this paper, preliminary though it is, suggests far-reaching implications and consequences which deserve closer examination and further research. Instead of summing up the preceding discussion, however, it may be more appropriate to state some conclusions and highlight some policy implications that emerge.

The trade policy reform in India, which seeks to dismantle restrictions on trade other than tariffs, and to bring domestic prices closer to world prices, represents a fundamental departure from the past. It may set in motion a sequence of changes large enough to reshape the parameters not simply for the agricultural sector but for the economy as a whole. The impact would not be confined to trade flows. It would extend to output and prices. The changes in the distribution of agricultural output and incomes between regions may accentuate inequities which would have political implications. The increases in domestic prices of wage goods produced in the agricultural sector are bound to erode food security which, in turn, would have social consequences. There may not be much comfort in the balance of payments either. Insofar as the volume of India's agricultural imports or exports would affect world prices, terms of trade are likely to worsen. The possibilities would be constrained further inasmuch as structural rigidities in the agricultural sector inhibit supply response. But that is not all. The unilateral trade liberalisation in India would, perhaps, be followed by the multilateral liberalisation of trade in agriculture and the introduction of an international regime of discipline for domestic support to, and intellectual property rights in, agriculture as integral parts of the Uruguay Round. The impact of these developments, which would inevitably change the structure of relative prices and costs in the world economy, on Indian agriculture would not be limited to the volume or the terms of trade in agricultural commodities. It would extend much beyond trade into domestic spheres such as subsidies for agricultural production, support for the public distribution system and the potential for technological progress. The new multilateral obligations may impose costs on the agricultural sector and the economy in India which are not compensated for by benefits. Once again, there may be no comfort in the balance of payments but food security may be put at risk.

The most important policy implication which follows is that it is necessary to be extremely careful while proceeding with trade liberalisation in agriculture, particularly in the context of the changes likely to follow successful conclusion of the Urugday Round. Although detailed policy suggestions would be out of place, certain analytical points which should inform policy formulation, do need to be summarised in conclusion:

(1) Domestic relative prices of agricultural commodities in India are quite different from world price relatives, so that price signals received by domestic producers may be different from those consistent with India's comparative advantage. It is, in principle

desirable to reduce this gap between world and domestic relative prices. But this is subject to the important qualification that India is a large producer or consumer of most agricultural commodities in the world economy, so that dismantling existing restrictions on international trade would, in general, worsen the terms of trade. For this reason, and purely in her own interest, India should retain some wedges between domestic and foreign relative prices so as to ensure that the terms of trade loss is not excessive. This prescription is based on the optimum tariff argument which suggests that, when the small country assumption is not valid, it may be necessary to restrict the volume of imports or exports either to improve the terms of trade or to prevent them from deteriorating as much as they otherwise would.

(2) The world market for agricultural commodities is, at present, extremely imperfect and large changes in world price relatives are likely if, for example, agreement on the Uruguay Round leads to a rearrangement of the existing pattern of subsidies and other forms of government interventions in agriculture. For this reason, the current world prices are unlikely to be good signals for the situation which might emerge in the medium term, say six years hence. If adjusting the current pattern of production to that dictated by current world prices involves costs, these costs may, to a large extent, turn out to have been incurred needlessly if world prices alter subsequently. This is particularly relevant for crops in which India is currently uncompetitive but for which world prices are likely to increase subsequent to an agreement in the Uruguay Round. It is important, therefore, that any unilateral trade liberalisation be sequenced properly with the phased multilateral trade liberalisation on the anvil, keeping in view the possible impact of the latter on the evolution of future world prices.

(3) The current policy regime in India in effect taxes producers of agricultural commodities (and the effective taxation also varies substantially across crops) while subsidising consumers of these commodities. The situation is exactly the opposite in much of the industrialised world, particularly in the European Community and Japan, where the policy regime subsidises producers of agricultural commodities directly from the exchequer or indirectly through implicit taxation of consumers. The reluctance of Europe and Japan to liberalise trade in agriculture stems from a concern about the adverse income distribution consequences for producers. In contrast, in India, where average income levels are low, the concern is about consumers. To the extent that the poor (most of whose consumer expenditure is on food) are a major beneficiary of these implicit subsidies, there will be an adverse distribution of income as a result of freeing international trade. There is thus an equity argument against rapid trade liberalisation. Similarly, some major manufactured exports are in effect subsidised because of the lower domestic price of agricultural inputs (for example, cotton); and cheap food may also to a considerable extent be seen as providing an indirect wage subsidy. To the extent that such implicit subsidies to exports and employment are desirable in a labour surplus, foreign exchange constrained economy, there is a 'second-best or third-best' efficiency argument for not removing trade controls on agriculture indiscriminately.

(4) In this context, it is possible to argue that it would be more efficient, and less costly for agriculture, if trade restrictions (other than the optimal tariffs) were removed and income transfers to the poor or subsidies to exports and employment provided directly, meeting the necessary expenditure through revenues raised by imposing direct taxes on agricultural producers. There is theoretical merit in such an argument but it has its limitations. Even in terms of orthodox theory, such a tax-subsidy alternative may not be the first-best if the taxes levied involve large collection costs or impose sizeable distortions elsewhere and if the disbursement costs of subsidies are significant. The feasibility of such a policy prescription is limited even more in view of the administrative and political problems inherent in collecting the necessary taxes, and because some of the required subsidies may also be GATT inconsistent. In any case, the equity and efficiency considerations involved mean that trade liberalisation should follow rather than precede steps to put in place the required transfers-subsidies framework and the revenue collection mechanism to sustain it. It should also be remembered that trade liberalisation is itself likely to lead to some loss in tax revenue.[29] This could adversely affect public investment in agriculture, much of which (especially in infrastructure and research) is complementary to, and will not be replaced by, private investment even if farmers become better off. Thus, the relative price changes consequent to trade liberalisation may, in the absence of an adequate fiscal effort, result in slowing down the pace of long-run technological progress in agriculture, already under threat from the TRIPS proposals in GATT.

(5) So much for relative prices. In addition, there is an absolute price implication which needs to be considered, especially in relation to the maintenance of food security. It follows from the fact that nominal wages in unorganised sectors of the Indian economy have a very low degree of price indexation so that sudden increases in nominal food prices can cause large declines in food consumption of the poor. This has been the major cause of famine mortality in the past. To guard against such an outcome, it is necessary to prevent any sharp upward movement of food prices either in the process of transition to a new set of relative prices or in the course of normal price fluctuations. Two observations follow from this proposition. First, even if it is decided to move eventually to a higher relative price for, say, rice, this should be phased carefully and not done suddenly by allowing free exports. Some policy device should be in place to ensure that such price increases occur only at a pace commensurate with the likely speed of adjustment of wages in the unorganised sectors. Second, since world prices are currently more volatile than Indian domestic prices, it would be desirable to continue with the present domestic buffer stock policy for food security instead of replacing it with a policy of maintaining foreign exchange reserves and relying on foreign trade to even out production-consumption imbalances. What is more, since such a buffer stock policy is credible only if some wedge is retained between domestic and foreign prices, this is a further argument not to move towards complete free trade in foodgrains. There are, of course, gains to be derived from trade, but an open trade regime in foodgrains, which raises absolute prices and increases their instability, would put food security at risk.

The considerations set out above dictate that India should retain wedges between domestic and world prices for a number of reasons: because she is a large producer or consumer of most agricultural products; because the world market for such products is highly imperfect and may alter substantially in the near future; because problems of taxing agriculture directly preclude quick movement towards a more rational tax-subsidy-transfer scheme to serve the ends of equity and efficiency in a labour surplus, balance of payments constrained economy; and because the level and the stability of foodgrain prices is the basic determinant of food security. For this purpose, some trade policy intervention in agriculture is both necessary and desirable.

The nature and the degree of such intervention would, of course, vary across commodities and over time, but there are two propositions worth stating. First, tariffs on imports or taxes on exports may have to be significantly higher than the usual 'optimum' levels warranted by a concern about terms of trade, simply because there are other important reasons for maintaining a larger wedge between domestic and world prices. Second, in some agricultural commodities, especially foodgrains, it may be necessary to use quantitative restrictions on trade in the interest of food security. In particular, some quota restrictions should continue on foodgrains exports and the government should retain its buffer stock policy including the option of importing food in order to sell this in the domestic market at

prices lower than those prevailing internationally. In addition, quotas may also be necessary in cases where the import tariff or export tax equivalent of the quantitative restriction may be too high for the desired wedge between domestic and world prices.[30]

These prescriptions are not meant to detract from the proposition that a considerable simplification of India's foreign trade regime in agriculture is both feasible and desirable. In particular, the uncertainties created by the stop-go use of discretionary controls, or the 'on-now-off-tomorrow' nature of much of the existing system of quantitative restriction on exports can and should be reduced by announcing export quotas in advance and maintaining these unchanged for at least one year, the *ad hoc* nature of the current regime of tariffs should be rectified by basing these on a more rational and transparent foundation, and, above all, consideration of India's comparative advantages should be made an integral part of domestic agricultural policy both while drawing up plans for infrastructure investment and while setting procurement or support prices. It must be recognised however, that all this requires more and not less careful intervention by government, which should treat 'liberalisation' not as an excuse for abandoning its strategic role in agricultural development and ensuring food security but as an opportunity to use markets to better serve these ends.

Notes

[An earlier version of this paper was presented at the ISID-FAO Workshop on 'Agricultural Policies and the New Economic Environment' held at New Delhi in September 1993. This revised version will appear in G S Bhalla (ed), *Economic Liberalisation and Indian Agriculture*, ISID-FAO, New Delhi, 1994. It is published here with permission from the editor.]

Some major changes in trade policy were announced, following the exchange rate adjustment, on July 4, 1991. However, the broad contours of trade policy reform, in terms of intentions, were first stated by the government in parliament. See *Statement of Trade Policy*, ministry of commerce, government of India, New Delhi, August 13, 1991.

For details, see *Export and Import Policy: April 1992-March 1997*, ministry of commerce, government of India, New Delhi, March 1992. The departures from the past emerge from a comparison with earlier import-export policy documents. See, for example, *Import and Export Policy: April 1990-March 1993*, Volumes I and II, ministry of commerce, government of India, New Delhi, March 1990.

Cf Jagdish Bhagwati and Padma Desai, *India: Planning for Industrialisation*, Oxford University Press, London, 1970; and Jagdish Bhagwati and T N Srinivasan, *Foreign Trade Regimes and Economic Development*, Columbia University Press, New York, 1975. For an elaborate, though somewhat different, discussion of the bias against agriculture, see Michael Lipton, *Why Poor People Stay Poor: A Study of Urban Bias in World Development*, Temple Smith, London, 1977.

The relative neglect of export crops relates to both plantation crops, such as tea, and to non-plantation crops, such as cotton. In the case of the former, rapid growth of domestic consumption ate into exportable surpluses and there was little attempt at evolving a deliberate price policy to restrain consumption or encourage production. In the case of the non-plantation crops, the situation was, if anything, worse, at least till the devaluations of the mid-1980s, because the import substituting crops benefited not only from increasing yields, due to improved technology, but also got price benefits as a result of the government's support measures. The result was that not only did yields increase less for the export crops but also that there was some shift of area from these crops to the import substituting ones. For a discussion of this issue, see Deepak Nayyar, *India's Exports and Export Policies*, Cambridge University Press, Cambridge, 1976.

For evidence that industrial mark-ups increased markedly in the OECD countries during the 1980s, see, for example, Stephen Marglin and Juliet Schor (ed), *The Golden Age of Capitalism: Reinterpreting Postwar Experience*, Clarendon Press, Oxford, 1990. The Indian evidence on relatively stable industrial mark ups is available from both the CSO's *Annual Survey of Industries* and the RBI's *Surveys of Large and Medium Private and Public Limited Companies*.

6 This assertion of course depends on the assumption that foreign firms are able to push up prices when tariffs are reduced, and this, in turn, assumes a particular type of market structure in world trade involving manufactured goods that developing countries buy from the developed countries —cf, A Yeats, 'Monopoly Power, Barriers to Competition, and the Pattern of Price Differentials in International Trade', *Journal of Development Economics*, 1978 (pp 167-80). Empirical evidence adduced by, e g, R Mehta and R G Nambiar, 'Tariffs and Foreign Prices', *Economic and Political Weekly*, Special Number, November 1988 (pp 2385-94) suggests that there is indeed such a negative relationship between tariffs and prices charged by foreign firms exporting to India.

7 In detail, the comparisons involve the following price quotations:
Wheat: World: United States, No 2, Hard red winter (ordinary), fob Gulf. India: Average of Kalyan (Delhi, Ludhiana), Dara (Aligarh), RR21 (Hapur) and FAQ (Patna, Ahmedabad, Bombay, Calcutta and Madras)
Rice: World: Thailand, white, 5 per cent broken, fob Bangkok. India: Average of Parmal (Delhi, Kapurthala), Long Bold (Bombay), Fine (Cuttack), Medium (Madras, Calcutta), IR8 (Bareilly)
Maize: World: United States, No 3 yellow, cif Rotterdam. India: Average of Yellow (Dohad, Chandausi), white local (Mandi, Bahraich), white HYV (Jammu, Bangalore).
Groundnut: World: Kernels of any origin, cif Rotterdam. India: Average of Bold (Hyderabad, Raichur, Rajkot, Bombay), FAQ (Kanpur).
Soyabean: World: US, No 2 yellow, cif Rotterdam. India: Average of Superior (Devas), Local (Indore, Haldwani).
Copra: World: Philippines/Indonesia, bulk, cif European Ports. India: Average of FAQ (Cochin), Dilpas (Kozhikode), Smoked Alleppey, Local (Mangalore)).
Cotton: World: Cotton Outlook Index A, Middling 1-3/32", cif North Europe. India: Average of RGJ-34 (24 mm fine), Y-1/Jyoti (24 mm fine), H-4A (27mm fine, Shankar 6B (30 mm fine) (all at Bombay).
Jute: World: Bangladesh, BWD, fob Chittagong-Chalna. India: W-5 (Calcutta, Hooghly).
Sugar: World: Caribbean Ports, fob, bulk basis (ISA). India: Average of quotes in Delhi, Calcutta, Bombay, Madras.
Tea: World: London Auction Prices (all teas). India: Average of quotes in Calcutta, Guwahati (all teas).
Coffee: World: Average of prices, New York/London (ICCA). India: Average of Plantation and Robchy (Madras, Virudhunagar).
Rubber: World: Singapore, No 1 RSS, fob. India: RMA (Kottayam).
Tobacco: World: Average of world trade unit values. India: Average of FHP in Andhra Pradesh and Virginia (Calcutta).
Pepper: World: Singapore, white, Sarawak 100 per cent. India: Best quality (Cochin).
Banana: World: Central America and Ecuador, fob United States ports. India: Average of quotes in Bombay, Delhi, Calcutta, Kodaikanal

8 An obvious case where import substitution has been pursued by keeping domestic prices well above world prices is that of oilseeds, for which incentive prices have been common in recent years, and in response to which production has expanded significantly

9 The exceptions other than cotton are all crops where India accounts for a large percentage of world export.

10 On relative cropwise incidence of subsidies, see Ashok Gupta, 'Input Subsidies in Indian Agriculture—A Statewise Analysis', *Economic and Political Weekly*, June 24, 1989.

11 Thus, according to World Bank calculations for 1989, the Indian domestic price, the Indian import parity price and the world price for urea (in US $/mt) were 142, 207 and 132 respectively, the corresponding prices for DAP being 218, 301 and 173, showing in both cases that there was an economic subsidy to Indian farmers in comparison to the import parity price but not in comparison with the world price (World Bank, *India 1991—Country Economic Memorandum. Volume II: Agriculture—Challenges and Opportunities*, August 23, 1991, p 147). Direct comparisons of Indian and foreign domestic fertiliser-crop price ratios, showing that Indian ratios are higher than for most countries, are also available in various issues of *Fertiliser Statistics*.

12 According to John Cummings, 'The Supply Responsiveness of Indian Farmers in the Post-Independence Period: Major Cereals and Cash Crops', *Indian Journal of Agricultural Economics*, 1975, the short- and long-run supply elasticities for rice are 0.37 and 0.38 respectively. The price elasticity of demand for rice has been estimated to be 0.56 by R Radhakrishna and K N Murty, *Models of Complete Expenditure Systems for India*, Centre for Economics and Social Studies, Hyderabad.

13 For some estimates of the issues and magnitudes involved, see N S S Narayana, K S Parikh and T N Srinivasan, *Agriculture, Growth and Redistribution of Income: Policy Analysis with a General Equilibrium Model of India*, Allied Publishers, 1991.

14 The state most likely to be affected adversely by this is the desert state of Rajasthan which has had above average agricultural growth during the 1980s, mainly through expansion of oilseeds cultivation which increased as a proportion of area cultivated from less than 20 per cent to more than 40 per cent over the decade.

15 For a detailed statewise and cropwise study of employment in agriculture, see Preet Rustogi, 'Labour Productivity in Indian Ag-

riculture: An Inter-State Analysis', MPhil thesis, Centre for Economic Studies and Planning, JNU, New Delhi, 1991 Preliminary analysis with data from this study suggests that there is unlikely to be any significant positive effect on employment if crop area shifts from those crops where the Indian relative prices are currently higher than world prices to those where it is currently lower Much higher employment differentials exist within crops between irrigated and unirrigated land and between small and large farms

16 See, for example, C H Hanumantha Rao, 'Policy Issues Relating to Irrigation and Rural Credit in India' in G S Bhalla (ed), *Economic Liberalisation and Indian Agriculture* (forthcoming)

17 Shankar Subramanian, *Agricultural Trade Liberalisation and India* OECD Development Centre, Paris, 1991 See also, Narayana, Parikh and Srinivasan, op cit

18 This is borne out by a reading of the text of the General Agreement on Tariffs and Trade, see *Basic Instruments and Selected Documents*, Volume IV, GATT, Geneva, 1969

19 Over the years, industrialised countries have, through distorted interpretation and sometimes through outright waivers and protocols of accessions, departed further from the letter and spirit of GATT rules in the implementation of their agricultural policies

20 In this paper, which was written in January 1993, the 'Dunkel Text' refers to the document circulated by Arthur Dunkel the director general of GATT to the contracting parties in late 1991 see *Draft Final Act Embodying the Results of the Uruguay Round of Multilateral Trade* Negotiations, MTN TNC/W/FA Geneva, December 15, 1991 The negotiations were concluded subsequently in late 1993, see *Final Act Embodying the Results of the Uruguay Round of Multilateral Trade Negotiations*, MTN/FA Geneva, December 15, 1993 The final outcome is, in substance, in accordance with Dunkel Text, except for some points of compromise between the US and the European Community Important changes in the "Final Act" which may affect the argument developed here are mentioned in footnotes at appropriate places in this section of the paper

21 The *raison d'etre* for the much wider scope is that some of the broader measures adopted by industrialised countries (e g, variable levies and export restrictions) are inextricably linked to their domestic support programmes Hence the latter are sought to be brought within the purview of international discipline

22 The details of the proposals outlined here, and in the preceding paragraphs, are based on the Dunkel Text cited earlier There is, however, an important change in the Final Act The limit of 5 per cent or 10 per cent on domestic support to agriculture is specified only for support in the aggregate and not for support in each product

23 It should be recognised that the reduction in subsidies would be implemented in stages over a period of six years This phased transition implies that the increase in prices, as also the possible production and consumption response would be less pronounced than would have been the case if the subsidy reduction was once and for all Moreover, the changes made between the Dunkel Text and the Final Act are all such that these would imply a lower price increase than would have occurred had the Dunkel Text not been modified

24 The available simulation results using Computable General Equilibrium models generally bear out these conclusions K Frohberg, G Fisher and K S Parikh, 'Would Developing Countries Benefit from Agricultural Trade Liberalisation in OECD Countries?' in I Goldin and O Knudsen (eds) *Agricultural Trade Liberalisation Implication for Developing Countries* OECD and World Bank 1990 present simulations which suggest that OECD liberalisation of agricultural trade will sharply increase Indian agricultural exports but have negligible effect on Indian agricultural output As a result, domestic agricultural prices will increase and domestic consumption of agricultural products would drop sharply reducing food intakes and increasing the number of hungry people significantly In Shankar Subramanian s (1991, op cit) model, OECD agricultural trade liberalisation without similar liberalisation in India has rather negligible effects However when OECD and India both liberalise this magnifies the effects noted earlier for a unilateral liberalisation by India Although agricultural exports increase sharply and agricultural output moderately, real wages fall in both agriculture and non agriculture, and all household groups other than richer farmers suffer real income losses which are larger than with unilateral liberalisation alone The two models differ substantially in their assumptions and this explains the rather different outcomes in terms of output Both share the weakness of assuming that world agricultural prices will remain unaffected if India liberalises, and this tends to exaggerate the likely export expansion But despite their differences, both models predict significant adverse effects on the poor

25 See Third Report of the Department Related Parliamentary Standing Committee on Commerce, *Draft Dunkel Proposals*, Rajya Sabha Secretariat New Delhi, December 1993

26 The provisions on 'public stockholding for food security purposes' and on 'domestic food aid' in the Dunkel Text, which form the basis of the discussion in the two paragraphs that follow, remain unchanged in the text of the Final Act But there is an important exception for developing countries provided by two footnotes added in the Final Act, which are reproduced below

(i) "Governmental stockholding programmes for food security purposes in developing countries whose operation is transparent and conducted in accordance with officially published objective criteria or guidelines shall be considered to be in conformity with the provisions of this paragraph, including programmes under which stock of foodstuffs for food security purposes are acquired or released at administered prices, provided that the difference between the administered price and the external reference price is accounted for in the AMS"

(ii) 'The provision of foodstuffs at subsidised prices with the objective of meeting food requirements of urban and rural poor in developing countries on a regular basis at reasonable prices shall be considered to be in conformity with the provisions of this paragraph"

It is clear that most of our concerns, arising from the Dunkel Draft, about the constraints placed on the public distribution system in India are met by the exemption implicit in these footnotes However, it seems to us that the restraints imposed by the Dunkel Text on market intervention operations by the government will continue

27 See Article 27 of the Annex on Trade Related Aspects of Intellectual Property Rights It is also stated that "this provision shall be reviewed four years after the entry into force of this Agreement" Thus, it is possible that plant and plant varieties may become patentable thereafter These, and most other, provisions on TRIPS of the Dunkel Draft remain unchanged in the Final Act

28 It would mean too much of a digression to enter into a discussion of the issue here Suffice it is to say that even if UPOV 1978 provides the basis for the *sui generis* system to begin with, which is by no means certain, a more stringent system, such as that in UPOV 1991, is likely to be imposed sooner rather than later, for the entire set of provisions would be the subject of review within four years

29 As a result mainly of the fact that this moves relative prices against industry which pays more taxes than agriculture

30 This may be particularly important for commodities where imports are a very small proportion of domestic consumption or exports are small in relation to domestic production It is for this reason that Japan and the European Community are reluctant to embark on a tariffication of their quantitative restrictions on agricultural imports

Challenges to Public Health Systems

C Gopalan

As we move to the next century we face the cruel paradox that despite growing prosperity and spectacular technological advances, the task of ensuring health and well-being for the citizens of the world is becoming even more difficult and expensive and complicated than ever before. To be sure, we have conquered some old 'enemies' to public health, but new challenges—some even more formidable and imponderable than earlier ones—have cropped up. These will demand even greater national vigilance and increased international co-operation for their solution.

HEALTH systems of most countries of the world, and especially those of developing countries, have come under increasing strain in recent years. In their efforts to achieve betterment of the living standards of their peoples, developing countries have embarked on ambitious developmental programmes invoking modern advances in science and technology. While these have undoubtedly been beneficial in several respects, they have also had their deleterious repercussions (direct and indirect) on public health. Thus, for example, the steep reductions in death rates achieved through the application of modern health technology, have not been matched by equally spectacular gains with respect to reductions in fertility, and mitigation of poverty. As a result most poor countries continue to be bedevilled by the twin factors of escalating population pressure and persisting poverty. While much of their 'old burden' of ill-health resulting from communicable diseases and undernutrition still remains, 'development' has generated new health problems related to increasing environmental degradation, ageing of population and dietary excesses and errors associated with affluence. Thus these poor countries now face the double burden of 'old' problems of ill-health which they have not as yet totally solved and of 'new' problems which they have acquired as the 'price' of development.

Global protectionist economic policies pursued by affluent countries and the harsh structural adjustments imposed on poor countries by international lending agencies (despite 'safety nets') have tended to aggravate prevailing gross inequities between, and within, countries. Vast sections of populations find themselves unable to meet their basic health/nutrition needs.

In industrialised affluent societies, increasing incidence of chronic degenerative diseases and cancer are contributing to a steady escalation of the cost of health care and to generation of new pressures on health systems. Science and technology, and affluence and development, have succeeded more strikingly in changing the profile and nature of diseases afflicting populations rather than reducing the overall burden of ill-health among them.

It is a cruel irony that some of the major challenges that public health systems now face are the by-products of the very technological advances primarily designed to promote human well-being. This is no reflection on technological advances themselves but perhaps on the manner of their use and on the failure of society as a whole to harness these new resources for the common good.

The challenges to public health are considered below under the following heads: (i) Impact of advances in health technology; (ii) The challenge of ageing; (iii) The changing profile of ill-health; and (iv) Environmental degradation.

I
Impact of Advances in Health Technology

Modern advances in medical science and health technology have, undoubtedly, opened up new vistas and have greatly enriched medical science and practice. Sophisticated new diagnostic and therapeutic tools have now become available for the successful management of a whole range of diseases hitherto considered incurable. Future advances in genetic engineering and bio-technology hold out promises of even more spectacular progress within the next two decades. These are achievements to be applauded.

Strange as it may seem, it is these very tools of progress that are now contributing to some of the major challenges that presently confront public health systems and indeed the medical profession itself! We will now briefly consider some of these.

Challenge to Traditional Philosophic Base of Medicine

Medicine has traditionally been looked upon as a noble profession—not just a hi-tech craft. It is as much an art as it is a science. It is certainly no trade, nor is it just a technology. Close physician-patient interaction informed by humanism has always been its hallmark. The traditional image of the physician in the eyes of the society and the family is that of a benefactor, healer, friend, philosopher and guide. Modern advances in health technology, if not wisely handled and harnessed, could threaten this precious philosophic foundation of medicine.

The challenge to the medical profession is to master and harness the emerging high technology in a manner that does not erode its traditional noble moorings. Even the superspecialist should not lose the art of sympathetic interaction with his patient as a 'whole individual'.

Escalating Cost of Health Care

A direct effect of the new sophisticated advances in diagnostic and curative technology has been the remarkable escalation of the overall cost of health care both in the private and the public sectors. The new tools that these advances have now made available are expensive.

Moreover with aggressive 'consumer movements' ever ready to arraign medical personnel for 'negligence', there could be a growing (understandable) trend on the part of the medical profession to 'err on the safe side', and to order a whole battery of diagnostic tests to 'exclude' even the remotest of possibilities. Diagnostic and curative procedures that might otherwise have been considered immediately unnecessary and that would have been reserved for a later stage only if proved necessary, may now be more freely and frequently resorted to. There is a growing feeling that many diagnostic tests and surgical procedures now being undertaken may not be really necessary. Even if this were not the case, the cost of health care in this technological age would have escalated. Even prosperous countries are facing formidable problems in responding to this challenge and in having to make agonising choices in the matter of allocation of national budgetary resources for different sectors of health care.

Inequities in Health Care

There have always been inequities with respect to the outreach and quality of even basic health care, as between, and within, countries. These inequities as between the

rich and the poor, and as between the rural and the urban sectors, could now be further aggravated.

'Rich and poor': In the case of poor countries, in which more than a third of populations are generally below the poverty line and wherein health services currently reach only a part of the rural populations, the arrival of modern expensive diagnostic and curative technologies could further widen the existing inequalities in the quality of health care as between the rich and the poor. Certainly, CAT scans, coronary bypass surgery and organ transplants are well beyond the reach of the poor. Public health administrations of even poor countries are bound to come under increasing pressure for the allocation of significant proportions of their meagre national health budgetary resources for these hi-tech areas, even in situations wherein basic requirements of safe water, immunisation and minimal levels of sanitation have not been ensured for a majority of the poor.

Organ transplants in particular are already generating major ethical issues. On the one hand, the poor cannot afford these expensive technologies; on the other hand, they could become victims of commercial exploitation by unscrupulous agents in search of organ donors. Many countries are still groping to find answers to this problem and to forge legal, institutional, and societal safeguards to ensure that the benefits of modern health technology are equitably shared, and unethical practices are curbed. The answers are not going to be easy.

Rural and urban: Modern advances in health technology could also aggravate differences in the quality of health care as between rural and urban populations. Some decades ago it was possible to practice medicine with nearly as much professional efficiency in a rural setting as in an urban area. With the advent of the new diagnostic and therapeutic techniques, this is no longer the case. Because of the urban migration induced by industrialisation, urban areas are likely to account for a much larger proportion of the total population of developing countries within the next decade. Thus India's urban population is expected to exceed 300 millions (a third of its total population) by the end of this century; and of this 100 million will be living in urban slums. Since the urban sector is more 'visible' and proximate to political power, health problems of the urban sector, and more especially those of the urban slums will demand greater attention and higher budgetary allocations. Considering that the outreach and quality of basic health care to the rural poor are already inadequate in most developing countries, this could mean a further widening of current disparities.

II
Challenge of Ageing

Practically all Asian countries struggling to achieve socio-economic development have, during the last few decades, adopted policies for the containment of the growth of their populations. These policies have resulted in varying orders of decline in birth rates. With improved health care and better access to modern health technology, these countries have also achieved varying orders of decline in mortality rates and increase in life expectancy. These declines in fertility and mortality are bringing about a demographic transition, the dominant feature of which has been the progressive ageing of populations. Thus, in the countries of south-east Asia (including SEAR), there will be varying orders of increase in the proportion of the elderly in the next few decades (see the table).

A population age structure characterised by an increasing proportion of 'old' dependents (>60 years or >65 years) will inevitably make increasing demands on national health and welfare systems and services. Young children and old people are the two population segments subject to the highest incidence of morbidity. Of the two, it is the latter (old dependents) that suffer higher levels of sickness, for, as is well known, with ageing there is significant decline in immunocompetence. Young dependents make far less expensive demands on health care than old dependents.

Moreover, diseases afflicting the old are more chronic and long-drawn. The cost of management per medical case for the age-group >70 years has been estimated to be four to five times higher than that for a case in the <5 years age-group.[1]

Thus, with increasing life expectancy, health problems of the aged will need increasing attention and higher budgetary allocations. While expenditure on children can be defended on sound economic grounds, expenditure on the aged can only be justified on humanitarian grounds. In the case of poor developing countries burdened with sizeable proportions of dependents at both ends of the age-scale, the task of resource allocation for health care will involve some agonising choices.

III
Changing Profile of Ill-Health

As was pointed out earlier, modern health technology and socio-economic development have brought about striking changes in the profile of diseases among populations. This process will gain further momentum in the coming decades. With better immunisation coverage, and improved environmental sanitation, acute infectious diseases will further decline. Because of this, and because of increased longevity and ageing, chronic degenerative diseases which are generally more expensive to treat, and which require a longer duration of treatment and yield far less rewarding results as compared to acute communicable diseases, will gain progressive ascendancy in the morbidity profile. Dietary excesses and errors associated with unbridled affluence could speed up this change. These changes in the profile of morbidity could contribute to the escalation of the overall cost of health care and compel diminished resource allocation for programmes that seek to address basic minimal health needs.

Two major problems which have burst into the health scene in recent years are likely to demand increasing attention and resources for their containment—AIDS and drug addiction. The future course of these new problems is as yet imponderable. AIDS, apart from being a major problem by itself, could also contribute to aggravation of the problem of tuberculosis.

IV
Environmental Degradation

The serious threat that global environmental degradation poses, not just to public health, but to the very survival of 'our earthship' has now become a matter of common concern for all mankind. Progressive environmental degradation is contributing to depletion of natural resources and aggravation of ill-health and undernutrition, and is emerging as a major threat to public health.[2]

The major concerns which are generally emphasised and articulated at world forums by the developed countries are those related to global warming, depletion of ozone layer, and loss of bio-diversity. Major environmental hazards which are the major concerns of developing countries are: (1) degradation of land productivity and soil erosion, which threaten future food supplies; (2) deforestation an

France	20.6	36.5

Source: World Development Report 1991, 'The Challenge of Development', World Ba

poor management of watersheds leading to frequent floods and large-scale devastation; droughts and desertification; (3) scarcity of safe drinking water; (4) pollution of the immediate environment through inadequate facilities for sewage disposal and discharge of industrial effluents; (5) pollution of rivers and coasts that threaten the fisheries; and (6) air-pollution of towns and cities through toxic fumes (such as methyl iso-cyanate in the Bhopal disaster) churned out by industrial establishments using borrowed, often outdated, technologies, without adequate safeguards and controls.

Environmental degradation is not only aggravating diseases attributable to insanitation and undernutrition among the poor but also to increased incidence of cancers and degenerative diseases among the affluent.

The challenges to public health discussed above would call for imaginative initiatives both at the national and global levels. It may be useful for our purpose, at this conference to consider these initiatives needed for this purpose under two broad heads: (1) initiative needed for ensuring minimal levels of primary health care to the poor and the underprivileged and (2) initiatives needed to counter the new challenges to public health posed by recent global policies and developmental transition.

Initiative for Ensuring Basic Health Care for All

The principles and policies enunciated at Alma Ata are as valid today as ever before. The minimal basic objective of public health policy must be to ensure access to basic primary health care to all—including the poorest sections of the world community. The essential components of primary health care as defined in the Alma Ata declaration constitute the basic minimal health care package. National and global policies must ensure that adequate budgetary allocations and other conditions needed for meting out these modest goals to even the poorest sections of populations become available. However, the achievement of these goals will not depend on financial allocations alone. What is even more important is the mobilisation and efficient management of material and manpower resources. This will need not only political will at the highest levels but the awakening of the people themselves. In the ultimate analysis it is people and people's power alone that can ensure public health and that can correct present aberrations and inequities in health care. 'New directions' must be mainly concerned with the identification of strategies needed for bringing about this awakening. We will briefly consider some of the strategies needed to correct these shortenings.

Ensuring public health is not to be treated as the sole responsibility of the health sector in the administrative set up of a country. Policies and programmes in other sectors such as, environment, education, welfare, industry, labour, information, etc, must also be informed and influenced by public health considerations. The objective of health for all has been eluding us because public health has not as yet become the joint concern of the people on the one hand and all sections of the government on the other.

The major initiatives needed for the attainment of the goal of health for all are briefly considered below:

(1) Community organisation, (2) Better management of available material and manpower resources, (3) Ensuring basic essential facilities, and (4) Reform of medical education.

Community organisation and involvement: In all discussions on health care, lip-service to 'community participation' notwithstanding, the real focus has always been on the 'provider', not the consumer. The assumption appears to be that the pattern of consumer-demand can be moulded and made to conform to the pattern of 'supply' which is largely decided from the armchair. The highly centralised vertical programmes launched and pushed without prior consultations and dialogues with the community are based on this lopsided approach and are, for that very reason, floundering.

There is no built-in mechanism within our health systems for ensuring accountability and achievement-audit. As a result, in the health field today, there is a yawning gap between promise and performance between inflated official claims on the one hand, and actual accomplishments as assessed by independent evaluations, on the other.

Accountability can only be ensured when a vigilant community becomes an active and informed participant in the system instead of remaining, as at present, an apathetic onlooker. Where the communities served are largely illiterate, poor and powerless, and are not actively involved in the formulation or implementation of programmes and services, they meekly accept (or reject) without complaint whatever is offered. They have no means of articulating and enforcing their demands and of thus contributing to the evolution and development of a meaningful health system which will answer their real needs.

There is at present a psychological divide between the provider and the consumer. The health service is largely perceived by the rural poor as a governmental bureaucratic operation to be availed of grudgingly and guardedly only in times of dire distress. It is not surprising, under the circumstances, that our health services are generally functioning well below their installed capacities. We need to initiate imaginative steps to bridge this gulf between the 'providers' and the 'consumers' of our health services. We may now briefly set out some concrete steps in this regard.

(a) Setting up of empowered village level community organisations. The implementation of health and welfare programmes will need creation of officially recognised (and technically and financially supported) network of village level women's organisations extending from the village to the district.[3] These village-level community organisations should act as the nodal points for interactions between the official (government) services and the community. All official functionaries at the village even if they are salaried government servants, must be considered as employees of the community organisation and answerable to it.

(b) Non-formal education of rural adolescent girls. While we should strive for the achievement of the goal of universal primary school education, we must also take notice of the reality that for at least the next two decades, millions of girls in the countryside in many poor countries will not be captured by the school system. An imaginative national programme of non-formal education outside the schools coupled with a programme of vocational training with a view to impart income-generating skills beamed to adolescent girls will be necessary in order that the very large number of young women who are going to shape the generation of the immediate future and who have dropped out of schools are properly equipped for the challenging tasks of motherhood and citizenship that await them.

This would call for an imaginative broad based programme for education for better living outside the school system.[4] Such a programme has to be suitably aligned with and mutually reinforced by an appropriate programme of vocational training. The organisation of such a programme would call for co-operation between non-governmental voluntary agencies on the one hand, and different sectors of the government on the other.

(c) Creation of a national health scout movement. The time has now come to initiate some imaginative actions which will help to convert such slogans as—'Health for all by 2000 AD', 'Achievement of health of the people by the people, for the people', etc—from rhetoric to reality. The interface between the provider and the consumer has to be bridged and this is the essential role of the voluntary agencies.

In order to bring this about it is important for voluntary agencies to mobilise the youth of the country, boys and girls, young men and women both in villages and urban areas into a massive national health scout movement (community health volunteer movement).

Recruits for such a national health scout movement could be given a short period of orientation and training. They could be assigned specific tasks for specified durations according to a set time table. In the performance of their tasks they could be helped, supported and encouraged by their trainers. Such motivated trainers could come from home science colleges and from departments of preventive medicine of local medical colleges. These between themselves could adopt specified sets of villages for promoting this movement.

The national health scout movement to be successful, must enjoy the official blessings and support of the departments of health and welfare of the government so that the scouts (volunteers) may command credibility among the community on the one hand and perform their tasks with self esteem and self confidence. This will also be a valuable learning experience for the volunteers who will be our future citizens. The movement could provide an opportunity for the youth to render dignified service to the community. It may help to turn the youth away from delinquency, drugs and violence—which in the modern age threaten to engulf them.

manpower and the highly abnormal physician-para-medical personnel ratio must be corrected More attractive opportunities for career promotion and for continuing education within the system could be offered to paramedics The upgrading of the post of some categories of health workers to that of health scientists with better salaries and introduction of training programmes for such upgradation could be considered This aspect is being discussed further later

Other basic facilities There are some basic facilities without which even the most intensive operations cannot achieve minimal levels of public health Two of these deserve special mention

(a) Safe drinking water Easy access to safe drinking water will save much time and energy of the poor women and contribute to better personal hygiene Far greater attention needs to be given to this item and to the promotion of personal hygiene if we are not to depend forever on 'oral rehydration' as the answer to the problem of diarrhoea in children

(b) The extension and enforcement of an efficient public distribution system (PDS) to the villages This will ensure that basic food commodities needed for adequate nutrition are available at reasonable prices to the village communities At present the public distribution system seems to exist only on paper in many rural areas of India PDS can also be involved in ensuring the availability of essential drugs to the needy poor

Reform of medical education Prevailing patterns of medical education in most countries (including developing countries) favour the growth of specialities and super-specialities and the emphasis is on curative rather than preventive approach This is perhaps understandable to some extent since every country would like to ensure that its professionals in any field are right in the frontiers of advancing knowledge and technology On the other hand especially in poor countries, much of the benefit of the sophisticated, expensive, modern technologies in the field of health care is beyond the reach of the poor What the poor need is better outreach and better quality of basic health care Devising a system of medical education which will meet the twin goals of mastery of the most modern health technology on the one hand, and the capacity to deliver primary health care to the majority on the other is indeed a formidable challenge Many doctors trained in the best medical colleges of developing countries find that conditions in the villages of their countries do not permit them to practice the profession with the required competence and satisfaction in this modern technological age The task of providing basic health care in

a rural setting does not apparently hold out the same glamour and intellectual challenge that the practice of a super-speciality in an urban setting does to the modern doctor.

Under the circumstances I have been pleading for quite some time for the creation of a category of health scientists (BSc Health Science) who will be trained in a manner that will help them to do adequate justice to the implementation of a basic primary health care programme, especially in rural areas with the utmost scientific competence.[6] They should be equipped with essential knowledge and skills needed for basic health care. Such a system must be supported by efficient arrangements for referrals. There has been considerable resistance to this suggestion on the part of the organised medical profession as being an attempt to introduce a substandard category of doctors (or 'semi-doctors') and of thus diluting the stature of the medical profession in the eyes of the public and in the hierarchy of professions. What I am pleading for is not the downgradation of the doctor but the upgradation of some categories of paramedics to a level where they can efficiently implement a programme of basic health care with highest level of competence. I am pleading for the improvement of the outreach and quality of basic health care; I am certainly not pleading for discouraging the growth of specialities and super-specialities. The challenge is to evolve a system of medical education and health care which will meet the needs of both ends of the health spectrum.

Initiatives to Meet New Challenges

Apart from problems related to achievement of basic primary health care, there are other emerging challenges to public health considered earlier. Some of these which need special emphasis are mentioned below:

Prevention of degenerative diseases: The increasing incidence of degenerative diseases such as coronary heart disease, and diabetes and of cancer is to be viewed as among the major hazards to public health, induced by recent developmental policies.

The logical answer to this problem lies in prevention rather than in therapeutic management. Developing countries in particular can just not afford the massive cost of therapeutic care of these diseases on a large scale. The preventive approach would largely consist in the identification and promotion of appropriate diets and life-styles which would help to curb the escalation of the incidence of these diseases. A massive programme of health/nutrition education designed to correct errors and excesses in life-styles and diets will be necessary and this indeed will be among the emerging challenges in the field of public health. The mass media and the electronic media could be used in imaginative ways for this purpose. Gratifying results have been obtained with respect to reduction in mortality from coronory heart disease in some countries through the preventive approach.

Control of ongoing environmental degradation: Rigorous control measures for checking depletion and pollution of land, water and other natural resources need to be intensified. Developing countries do not have the required infrastructure for this purpose. Even with respect to food-quality control, available facilities are woefully inadequate and need to be greatly improved, especially since street foods, ready-to-eat foods and fast foods are increasingly coming into vogue even in poor countries. Without such controls, these developments could seriously endanger public health.

Response to Ageing: Another major challenge that poor developing countries will increasingly face in the next few decades will be with respect to health care of the aged. The strategy here must be to ensure that at least the 'young old'—i e, people in the age-group <70 years remain active, healthy and productive so that they do not add to the dependency burden. This will again call for education and propagation of healthy habits of life-style and diet among the aged. Developing countries, which cannot afford adequate old age pensions or heavy investments for the care of the elderly, must devise arrangements for providing support and incentives to joint families which support aged parents and relatives.

Checking commercial exploitation of third world malnutrition: A disturbing trend in recent years has been the attempt on the part of the commercial circles to exploit third world malnutrition by promoting unsustainable solutions and remedies for their major public health nutrition problems. The attempt to push iodised oil injections (which is expensive and beyond the technological capabilities of poor countries) as an answer to the problem of iodine-deficiency disorders in preference to salt iodation (which is well within their reach); and the attempt to push massive dose of synthetic vitamin A even in infants as an answer to the problem of vitamin A deficiency in countries wherein there is an abundance of inexpensive carotene-rich foods available are examples of such inappropriate technology. This unethical trend must be discouraged.

Privatisation of research in genetic engineering: Yet another disturbing trend that may have far-reaching public health repercussions is the growing trend towards privatisation and secrecy in the area of research in bio-technology and genetic engineering. Much of the essential raw material for such research is collected from poor countries through expeditions to developing countries: but the products of research are not being equitably shared. Since genetic engineering is likely to play an important role in public health and nutrition in future, this trend needs to be combated by the enlightened international community.

There are other major issues related to public health and medical profession such as: the sharing of costs of health care as between the private and public sectors; questions of medical ethics; the need to evolve a fair system for consumer protection that will not lend itself to misuse and harassment of doctors; gender bias in health care (in some countries); policy on essential drugs, policies for discouraging unnecessary diagnostic tests and therapeutic intervention. All these are important, but because of time constraint have not been touched upon in this presentation.

As we move to the next century we face the cruel paradox that despite growing prosperity and spectacular technological advances, the task of ensuring health and well-being for the citizens of the world is becoming even more difficult and expensive and complicated than ever before. To be sure we have conquered some old 'enemies' to public health; but new challeges—some even more formidable and imponderable than earlier ones—have cropped up. These will demand even greater national vigilance and increased international co-operation for their solution.

Notes

Social Cost-Benefit Analysis of Investment in Irrigation

Rajender Singh

As commercial profitability cannot be a guide to the economic and social choice of an infrastructural public investment irrigation project like the Main Western Gandak Canal Project in Uttar Pradesh, economic and social profitability of the project has been calculated using UNIDO method of project evaluation. It is not until income distributional considerations are brought into the picture that social profitability of the project reaches a level at which the project's selection becomes justifiable from a social angle.

THE importance of irrigation for increasing agricultural output and employment was realised from the very inception of planning in India. Massive efforts have been made, therefore, to develop irrigation potential through construction of various type of irrigation projects. Alongside followed studies in the economics of irrigation projects. In particular mention may be made of those by Gadgil (1948), Savani and Rath (1960), Sonachalam (1963), Singh and Mishra (1965), Raj (1960), REO (1965), Chopra (1972), Sinha and Bhatia (1982) and Murty (1978). The studies conducted prior to 70s used the traditional revenue-cost or market type cost benefit approach and suffered from one or the other limitation. During the 70s and after, modern social-cost benefit approach to evaluation of public irrigation projects came to be increasingly adopted. However, none of the studies carried out in the recent past, except by Murty (1979), have made any attempt to incorporate the contribution of an irrigation project to the national objectives of income distribution. Moreover, the shadow prices of inputs like unskilled labour, fertiliser, etc, in these studies have been estimated either by using the partial equilibrium approach [UNIDO (1972) and OECD (1974)] or the values have been assumed on grounds or reasonableness.

In the present paper an attempt has been made to investigate the economic and social profitability of public investment in the Main Western Gandak Canal Irrigation system which lies in the high rainfall area and traditionally poor region of eastern Uttar Pradesh. It aims at overcoming the above limitations by taking into account almost all the relevant aspects of the project, including the projects' income distributional effects and estimation of shadow prices of inputs using the general equilibrium approach of linear programming. The need for such a comprehensive study arose from the fact that the results of a preliminary study [Sharma 1979] in the command area of this project had made it clear that expansion of irrigation facilities during the 1960s had limited impact on the cropping pattern, crop yield and irrigated area. These being the basic variables for determining the economic, social as well as private profitability of an irrigation project, one can hardly overemphasise the need for conducting a detailed ex-post evaluation of the Main Western Gandak Canal Project.

Project and Sources of Data

The Gandak Canal Project is a major inter-state project designed to exploit the water resources available in the eastern part of India along the Himalayan foothill plains covering parts of Uttar Pradesh, Bihar and Nepal. The project was designed and approved by the Planning Commission in 1961, its main objective being to provide assured and controlled supply of irrigation water to the command area of the project. Initially the total cost of the project for Uttar Pradesh was estimated at Rs 15.15 crore. Since then cost has been revised in 1966 in 1978 and in 1983. The respective cost estimates were placed at Rs 50.38 crore, Rs 85.55 crore and Rs 103.45 crore (Draft Annual Plan, 1984-85, 1986-87).[1]

The project consists of a barrage constructed across the river Gandak at Valmikinagar on the Indo-Nepal border at about 1,500 feet below the existing Tribeni Canal Head Regulator located in the territory of Nepal. Water from this barrage is diverted into three main canals, viz, the Western, Eastern and Nepal Western Gandak canal flowing in the states of Uttar Pradesh and Bihar and in Nepal respectively. The scope of the present paper is limited to the Main Western Gandak Canal (with a capacity of 15,800 cusecs) including the Command Area Development Project which started in the command area in the year 1972-73 when the Main Western Gandak Canal started providing water to Gorakhpur and Deoria districts of Uttar Pradesh. The gross area of the command is estimated to be 5.39 lakh hectares with a cultivable area of 4.43 lakh hectares. The command area development project was introduced for speedy and optimum utilisation of irrigation potential created which consisted of construction of on-farm development works as also provision of infrastructure facilities like construction of link roads, supply of basic inputs like HYV seeds, fertilisers, etc.

The data on public investment and operational cost of the project were collected from project reports made available by the Gandak Project office and the Gandak Command Area Development Authority located at Gorakhpur. The data for the estimation of income benefits were collected by the author through a sample survey of four villages in the command area of the project covering 450 households.

Out of the two approaches generally used for project evaluation, viz, 'before and after the project' and 'with and without the project', the latter approach has been used for estimating the income benefits due to the project. The life of the project has been assumed to be 30 years from 1972-73 onwards.

The project region has been classified into four major soil groups. Expectedly, the yield of crops and cropping pattern in each soil complex would be different . Keeping this in view, purposively four villages were selected, one typical village of average size from each soil group. Initially, a pilot survey was conducted to test the questionnaire. After this the questionnaire was revised and a comprehensive census of four selected villages, covering all the households was taken. The selected villages are: Parsa Buzurg, Gopalpur, Chakhanipuram Chachapara and Purnaha Mishir. The first two villages fall in Gorakhpur district and the latter two under the jurisdiction of Deoria district. The survey of the selected villages was completed during January-March 1980 while the data collected relate to the agricultural year 1978-79.

In selecting typical villages and taking a sample of all the households, it is apparently assumed that information collected this way is as representative of the region as would be the case if it was a stratified sample of farmers randomly selected and scattered over the whole command area. In the Gangetic Plains the structure of the economy of an average village is generally found to repeat itself in other villages of the re-

gion. Secondly, in a Robinson Crusoe type of enterprise like ours covering even 450 households scattered over the whole command area would have been simply impossible given the time and resources available. It is for these reasons that we preferred to adopt the above approach. In all 450 households were covered and the survey conducted by personal interviews of respondents focused on eliciting information on *inter alia* the following major items: land utilisation pattern, details of family workers, their education and occupation, cropping pattern, input-output data for each crop grown in different seasons, inventories of farm assets including livestock, investment and operating cost data on private tubewells and traditional methods of irrigation, prices of farm level inputs and outputs, etc.

Approach

Out of the two established methodologies of project evaluation, namely, the UNIDO (1972) and the OECD (1974), we have used the former as in a developing country like India, this methodology appears to be more in confirmity with the economic environment and the planning framework. Owing to the existence of market imperfections and government intervention market prices do not always indicate the true economic social value of inputs and outputs. Therefore, commercial profitability cannot always guide economic and social choice correctly and one needs to work out the economic and social profitability indices of the project choice from the national economy and society's angle.

The economic and social evaluation of the project requires an explicit statement of relevant objectives of the national economy and society, so that benefits and costs of the project may be measured in terms of those objectives. The main objectives of economic development planning in India have been (1) increase in national income; (2) generation of additional employment; (3) reduction in income disparities between regions and income classes; and (4) attainment of self-reliance. Although, not explicitly stated in the plan documents, increase in the level of savings and investment implicitly lies behind all these objectives. In the evaluation exercises of the project we have attempted to incorporate the contribution of the project to all these objectives except the fourth. This is because the project does not directly involve foreign exchange cost or earning.

The evaluation procedure followed is that of successive complication, introducing adjustment for one factor after another, and computing at each stage the values of the decision criteria, the NPV, the B/C ratio and the IRR. Beginning with commercial evaluation at market prices, adjustments have been successively made for accounting wage rate of unskilled labour employed in the project as well as in agricultural operations, for accounting price of fertilisers and finally for the accounting price of investment in the project. At the end we get the combined effects of these adjustments on the values of the decision criteria. The problem of incorporating income distributional effects has been relegated to the last section. Before presenting the results of the successive adjustment exercises we present below a brief discussion on various accounting prices and their estimation.

Since the costs and benefits occur at different points of time over the life of the project, these are as such not commensurate with each other. The social rate of discount (SRD) is used to make them commensurate which in turn enables us to compute project's worthiness from the present value of costs and benefits. From the theoretical point of view, the SRD reflects the society's impatience for present over future consumption. It is defined as the rate at which the weights attached by the society to units of consumption measured in terms of present consumption fall over time. As discussed in the literature on cost-benefit analysis, average market rate of interest and marginal productivity of capital cannot be taken as proxy for the social rate of discount owing to noncompetitiveness of the capital market, saving-investment inoptimality, non-shiftability of capital, etc.

Following the UNIDO guidelines, we know that the social rate of discount is a national parameter. But in India no particular estimate of this parameter is provided by the policy-makers. In the absence of any such estimate, keeping in view the results of some studies [Mishra and Beyer 1976, Murty 1978, etc] and assuming that SRD has an element of value judgment, we have accepted and used 10 per cent as its value for our purposes.

In an economy with sub-optimal level of saving and investment patterns, capital investment made in any particular project should be assigned some premium. It is this premium which indeed reflects the shadow price of investment. In other words, the shadow price of investment is defined as present value of consumption which an additional unit of investment fetches to the economy. According to the UNIDO Guidelines, the shadow price of investment is determined by the social rate of discount (i) the opportunity cost of capital (q) and the rate of reinvestment (a) or share of savings in the incremental income. The formula of the Guidelines is expressed as

$$P^{inv} = \frac{(1-a)q}{i-aq}$$

In order to estimate the shadow price of investment, most plausible values of a, q and i for the Indian economy have been taken [Mishra and Beyer 1976; Choudhury and Sen 1970; Sinha and Bhatia 1982]. These are a = 0.25, q = 0.15, i = 0.10. The value of shadow price of investment for these values works out to 1.82. Admittedly, like in the case of SRD, there is no certainty attached to this value. Indeed, it is on the higher side than the values used by most research workers in India, which is 1.5. For this reason we have assumed that the shadow price of investment lies in the range of 1.5 to 2.0. And the effect of this variation has been handled by a sensitivity analysis. Both costs and benefits of the project have been accordingly adjusted. On the cost side, we have calculated the economic cost of investment by multiplying the nominal investment cost by the shadow price of investment. On the benefit side, reinvestment benefits have been calculated by multiplying the proportion of additional income saved by the shadow price of investment.

Incorporation of employment objective in the project evaluation necessitates the use of accounting wage rate in the evaluation of public investment projects. Under the conditions of competitive labour market, market wage rate would reflect the economic cost of labour. In its absence there would arise divergence between the market wage rate and the shadow wage rate, or the real economic scarcity value of labour.

The UNIDO formula for accounting wage rate (AWR), including both direct and indirect cost of labour is given as follows:

$$AWR = MVP + S(P^{inv} - 1)W \qquad ...(1)$$

where AWR is the accounting wage rate

Table 1: Production Function Approach—Estimates of Marginal Value Product of Labour Per Day of Work

(in Rs)

Farm Size-Group (in acres)	Early Paddy	Wheat
0.00 - 2.50	7.28	9.75
2.51 - 5.00	9.04	15.75
5.01 - 10.00	2.48	8.29
10.01 and above	14.00	5.10
For all farms	8.49	9.61

Table 2: Linear Programming Approach - Estimates of Marginal Value Product of Labour

Type of Labour	Group Season	MVP or Shadow Price (Rs)	MVP/MW
Family	Kharif	0.17	0.07
Family	Rabi	0.00	0.00
Hired	Kharif	5.33	1.33
Hired	Rabi	6.03	1.51

MWR = Market Wage Rate, MVP Marginal Value Product

MVP is the marginal value product, 'S' is the rate of savings from profits W is the project wage rate and P^{inv} stands for the shadow price of investment

Assuming SW to be the proportion of additional income saved by workers the above formula will get modified to

$$\overline{AWR} = MVP + (S - Sw)(P - 1)W \quad (2)$$

It is clear from equation (2) that if marginal saving rate of the labourers and capitalists are the same then the effect of shadow price of investment will be zero and the AWR will be equal to MVP

We have estimated the accounting wage rate (AWR) for the Gandak project using the formula (2), given above From our survey data the marginal propensity to save of unskilled labourers in the project area works out to be 29 per cent If we take 29 per cent to be the reasonable rate of savings out of profits in India it means that the values of the parameters S and Sw' in the above formula are the same and equal reducing the indirect social cost of unskilled labour for the project to be zero Thus, the AWR for our project is reduced to the direct cost of labour only, which of course is equal to the marginal value product of labour

Several methods have been used for estimating marginal value product of labour Little and Mirrlees (1974) have suggested half of the average product as a reasonable approximation to marginal value product of labour The marginal value product of labour has frequently been estimated using the production function approach This approach, however, has been found to invariably yield a value of MPV>0 even when there is surplus labour in the economy This is because production function fails to take care of total supply of labour It takes care only of ex-post demand for labour used in the production process It is not therefore surprising that MVP thus estimated turns to be greater than zero in the presence of surplus labour in the economy An alternative to this is to use a general equilibrium approach, like that of linear programming for its estimation or for that matter for estimating the shadow price of other inputs as well In order to estimate the marginal value product of unskilled labour for the Gandak project region, we tried both these approaches in order to see difference the two approaches make We fitted a Cobb Douglas production function in respect of two predominant crops early kharif paddy and rabi wheat The holdingwise input output data to which the function was fitted are from our survey in the project area referred earlier The estimated values of the MVP for different size classes of formers are presented in Table 1

It is clear from Table 1 that for all size classes the estimates of MVP far exceed the ruling market wage of Rs 4 00 per day, except in the case of early paddy for size class 5 01 10 00 acres The fact that the estimates are higher than the ruling market wage rate itself however point towards existence of surplus labour The supply conditions are such that the market wage rate is far below the marginal value product of labour But as the production function approach ignores the unused supply of labour, it fails to show up its existence through the value of the marginal product For this reason we have estimated and used the shadow wage rate of labour as obtained from the linear programming approach which takes care of the total demand and total supply of labour in the region A linear programming model was formulated and used for this purpose [3] The social objective function of this model is to maximise gross value of agricultural output subject to resource constraints one of which is labour The dual or the shadow prices of labour as obtained from this model are given in Table 2

It is clear from Table 2 that family labour has a zero marginal value product and is therefore surplus in the rabi season In the kharif season family labour is just as much is required since its marginal value product is close to being zero but settling just above it at Rs 0 17 However, for hired labour the marginal value product is positive and higher than the market wage rate in both the crops seasons Incidentally, for actual payment the market wage rate is relevant for the hired labour only Family labour indicates self employment involving no wage payment For our evaluation exercises it is these prices or their ratio to market wage rate which have been used

It should be noted that for our project, corrections for market wage rate are required at two levels the project as such and the farm level Whereas for the farm level cost estimation we have used the accounting wage rate given in Table 2, for the project level the AWR of unskilled workers has been assumed to be zero on account of the following reasons We know that most of the project construction work is carried out during the rabi season and before the start of the kharif season with almost no project work done during the rainy season with which kharif season synchronises And it is during this period that family labour-time component that is drawn to project site work It is therefore, valid to attach zero economic value to family labour that goes to work on the project Society does not lose anything in the form of forgone value of crop output when the surplus family labour is employed on the project

The shadow prices of fertilisers as turned out by the same linear programming model along with their market prices are given in Table 3 It is to be noted that Urea and NPK fertilisers as the resource constraints, have been introduced in the model on an annual basis The accounting price of fertilisers[4] reflect the use value of fertilisers from the society s angle, indicating their contribution to social welfare, in this case the maximisation of the gross value of agricultural output from the project area The accounting price of fertilisers in the case of urea is higher than its market price It implies that use of accounting price of urea will have adverse effect on the decision criteria, as it will increase the social cost at the farm level On the other hand dual price of NPK will have favourable impact on the social profitability of the project because the entire cost of NPK from the society angle is reduced to zero

It should be noted that like the accounting prices of unskilled labour and fertilisers as obtained from the linear programming Model-II, we have not used the dual prices (accounting prices) of land and water given by the model in the evaluation of the project The accounting price of land indicates the rental value of land and we know that the rental value of land does not reflect the cost of land from the economy/society angle In fact the rental value of land is nothing but the private use value or the price of using the land However, in the evaluation of the project, we are concerned with the economic/social cost or value of land which is defined as the net present value of output forgone In our case the net present value of output forgone is given by the net present value of output on unirrigated area or control area In other words, it is the net present value of output under 'without the project' situation which is deducted from the net present value of output under 'with the project' situation in order to obtain the net present value of output due to the project Similarly, the dual price of water does not indicate the cost of water from the economy/

–2 65	4 346
–2 92	5 048

society angle. It reflects the use value of water which may be compared wth the actual water charges fixed by the irrigation authorities, working as a monopolist. The relevant cost of water is the investment cost of the project evaluated at shadow price and in the economic and social evaluation of the project we have taken the investment cost as the cost of water.[5]

For the purpose of determining distributional weights we follow here the method developed by Scott and others (1976). As per this method, we require the value of per capita income of the project region (Yr), critical minimum income level (Ycr) and the elasticity of marginal utility of income (e). The per capita monthly income of the region has been estimated from the survey data on the supposition that per capita monthly income of the sample households is representative of the per capita income of the project region. The critical minimum income is the per capita monthly income of India which is estimated to be Rs 82.00 at 1975-76 prices. Following the review of literature, we have adopted a range of value for 'e' from –1.5 to –3.00 and calculated distributional weights. For different values of 'e' starting from (–)1.5 and increasing it everytime by 10 per cent until we approach the upper limit of (–3), we have computed the distributional weights using the formula due to Scott and others where the weight $Wr = \frac{(Ycr)^e}{Yr}$ The results are presented in Table 4.

It is clear from Table 4 that even at the smallest value of 'e' the social value of a unit of regional income is more than twice its nominal value. Since the value of 'e' is uncertain, one may legitimately ask whether the weight Wr could not be computed without bringing in 'e' in the picture, i e, removing the exponent 'e' from the right hand side of the equation. Besides its value being uncertain, there is another argument in favour of dropping 'e'. Starting from any level of income, if income increases, consumption also increases and the elasticity of marginal utility of income, 'e' falls *ceteris paribus*. Further, it may be mentioned that the value of 'e' would change over time following the economic development of the country and growth in income. The value of 'e' is thus not independent of Ycr and Yr. From the formula of determining weights $\frac{(Ycr)^e}{Yr}$ it is clear that when there is a large difference between the regional and social per capita critical income, the ratio (Ycr/Yr) would be larger and 'e' would also be larger, for the higher value of 'e' reflects the greater concern for income distribution. As this difference declines which is likely to happen due to the project,[6] the ratio (Ycr/Yr) would fall, until it reaches the value of one at which the regional per capita income comes at par with the national per capita critical income. At this 'e' will make no difference to the weight but then the problem of weighting regional benefits itself disappears at this value of the ratio.

One may, therefore, prefer the simple ratio of Ycr and Yr as giving the regional income weight without having to be involved with 'e'. In fact, this has also been suggested by Foster (1966). For analytical interest it may be desirable to work with both sets of weights, with and without 'e' to see whether any difference is made as to the judgment about the project. Similar to the weights due to increasing value of 'e' (Table 4), we have taken a range of simple weights (Ycr/Yr) starting from its actual value of 1.74 going down to 1.10 and the results of these variational exercises are presented in Table 8

Results

The commercial benefits and costs over the expected economic life (42 years) of the project have been assessed at the market prices of relevant inputs and outputs. The results of the commercial evaluation indicate that at 10 per cent rate of interest, which is the minimum interest rate currently charged by the financial institution in India in term loans, the commercial profitability of the Western Gandak Canal Project turns out to be negative, with a net present value (NPV) of the Rs (-)452.10 lakh. Expectedly the B/C ratio in less than unity and the value of IRR worked out to 8.39 per cent. Certainly commercial profitability cannot always be a guide to social choice more so of an infrastructural project like the Main Western Gandak Project. Accordingly, we have proceeded to assess profitability of the project based upon the accounting prices. The results of the evaluation are given in the ensuing paragraphs.

We may begin by noting that by using the above accounting prices for calculating the values of the decision criteria we are at the same time incorporating the contribution made by the project to employment objective. The ratios of the accounting to market prices which may be called the correction factors have been used to work out the economic cost of labour. When the cost at market price is multiplied by these factors we get the corresponding social costs of labour. At the project level, since this factor is zero the effect is that compared to the market cost, the total cost of the project is reduced by the amount equivalent to the wage bill of the unskilled labour. At the farm level, cost of family labour in the kharif season is reduced by 93 per cent, while in the rabi season entire cost of family labour is reduced, to zero.

On the other hand the correction factors for hired labour at the farm level are 1.33 and 1.51 respectively in the kharif and rabi seasons. Their effect, therefore, is in the direction of pushing up the economic cost in comparison to market cost. These corrections have been introduced for unskilled labour. As a result of the corrections both the costs and benefits streams get affected. On the cost side, the social cost of the project is comparatively reduced by the order of total wage bill of unskilled labour employed on the project each year. On the benefit side, since farm cost of unskilled labour is reduced from Rs 4.97 per acre to Rs 4.22 per acre, as a result of this correction the additional value of crop output is enhanced by Rs 0.75 per acre. Consequently, the additional value of crop output due to irrigation increases from Rs 167.35 per acre as in the commercial evaluation to Rs 168.11 per acre on economic basis. We have assumed in these calculations that the cost of other categories of labour like the semiskilled, skilled, etc, at market wage rate reflects the corresponding economic cost as well.

The estimates of the NPV, B/C Ratio and IRR with adjustment for accounting wage rates are presented in Table 5. The NPV of the project with accounting wage rate is still negative at 10 per cent rate of discount, although it is far more higher than the same amount obtained in the commercial evaluation, i e, Rs (-)452.10 lakh. The internal rate of return (IRR) of the project is now very

Table 5. Summary of Evaluation Results

Alternatives	NPV at 10 Per Cent Social Rate of Discount (in Rs Lakh)	IRR (Per Cent)
With market prices (Commercial evaluation)	–452.10	8 39
With accounting wage rate of unskilled labour	–7 88	9 97
With accounting price of fertilisers	–526 10	8 07
With accounting wage rate of unskilled labour and accounting price of fertilisers	–71 86	9 74

Table 6 Sensitivity of NPV and IRR of the Project with Respect to Accounting Price of Investment at 10 Per Cent Social Rate of Discount

Accounting Price of Investment	Using Accounting Prices of Labour and Fertilisers: NPV (in Rs lakh)	IRR (Per Cent)
1 00	–085 55	8 54
1.50	–1,055.31	6.29
1 65	–1,285 32	5.86
1 81	–1,547 91	5 50
2.00	–1,821.92	5 13

close to the social rate of di ratio of the project at 10 p of discount is 0 99 in th close to being a margin values of NPV B/C r accounting wage rates commercial evaluation from increases in ben fi costs in each year th project

In case of fertilise corrections have been accounting prices of two urea and NPK It shoul have not made any tion between these tw Although, there are so trogen in both types of put their quantities as constraints in the linear p cise and obtained then As in the case of accou unskilled labour the c urea and NPK are the r to respective market p economic cost of a u correction factors, is gi Table 3 for Urea works NPK it turns out to be corrections for the fertilisers the stream same as in the comme the additional benefit s tion made available by paratively reduced Th counting price of Ure is market price And it is the farmers compar NPK The additional acre in this case wor whereas in the comme Rs 167 35 per acre Th ing the same and the duced, the values of th reduced in comparis tained in commerci

After examining the prices of unskilled l separately on the proj values we now work o of these prices It is n accounting wage rate increases the benefits accounting price of fer the cost stream uncha efit stream adversely combined effects of th tional value of benefi works out to Rs 161 5 which lies between th benefits using acc (Rs 168 1 l per acre) an ing price of fertilisers The resultant value of IRR are given in Table

The NPV of the pro social rate of discount

Rs 71 86 lakh The IRR of the project works out to 9 74 per cent which lies between the IRR s calculated while using accounting wage rate and fertilisers separately However, it is greater than the commercial evaluation case where it was 8 39 per cent

A comparison would show that compared to the position at market prices, the accounting prices of unskilled labour make a tremendous improvement in the position but there is again a pullback due to accounting prices of fertilisers

Investment is valued for improvement it makes in future social consumption Additional income benefits are, therefore required to be broken into immediate consumption and investment (savings) and the latter has to be valued in terms of the present value of future consumption it makes possible It is widely held that saving-investment pattern in a developing country like India is inoptimal in the sense that one unit of immediate consumption has less value than a unit of investment as the present value of future consumption due to it is higher than the former indicating that accounting price of savings or investment in terms of consumption exceeds unity For the purpose of evaluating the impact of savings we have used an accounting price of investment equal to 1 50 In other words we are giving 50 per cent premium to a unit of investment made in the project or a unit of saving generated out of the additional income earned due to the project Since it has been suggested that accounting price of investment may be even higher or lower than 1 50, a sensitivity exercise in the range of 1 00 to 2 00 carried out later shows the effect of such variation

While nominal value of investment made in the project is available from the project report for savings out of additional income, we need to identify different groups and their shares in the additional income due to the project These we have identified as the farmers unskilled labourers and the government Farmers get additional income due to the project in the form of additional value of crop output In turn they pay irrigation charges to the government Thus, a part of the farmer's cost become government's income Unskilled labourers obtain additional wage income at the farm and the project level The wage income of unskilled labourers at farm level becomes farmer's cost while wage income received by them at the project level becomes government's cost The government incurs the entire capital and operational cost of the project As a benefit it gets the irrigation charges from the farmers in the project region Thus one group of project beneficiaries cost (loss) becomes another beneficiary's benefit (gain) This is how redistribution of income takes place due to the project in the region Since these beneficiaries do not consume whole of their additional income, the proportion of additional income saved results into reinvestment benefits due to the project In order to calculate the savings impact of the project on the net aggregate consumption benefit due to the project, we need information on the marginal propensities of the beneficiaries to save, so that we can calculate the total savings made by different groups Since the accounting price of investment is the present value of future consumption benefits made possible by one unit of investment, the total consumption benefits due to savings is obtained, by, multiplying the additional income saved by each beneficiary group with the accounting price of investment The net aggregate consumption benefits will then be equal to the sum of immediate consumption benefits and present value of benefits due to reinvestment of savings

We have estimated marginal propensity to save of the farmers using our own survey data The marginal propensity to save of the sample farmers as a whole works out to 29 per cent [Singh 1983] In the case of unskilled labourers we have assumed that marginal propensity to save of these labourers is the same as that of marginal farmers belonging to holding size group 0-2 50 acres The validity of this assumption rests on the fact that most of the unskilled labour come from this category of farmers The marginal propensity to save of unskilled labourers this way works out to 29 per cent [7] In the case of government we have assumed that the entire additional income received is saved It should be noted that the accounting price of investment on the cost side is applied to the capital cost alone excluding the operational cost simply because it represents the annual working expenses

With the accounting price of investment assumed for India in the range of 1 00 to 2 00 and the marginal propensity to save of the farmers, unskilled labourer and government being 0 29, 0 29 and 1 respectively we have estimated the values of the NPV, and the IRR which are presented in Table 6

TABLE 7 SENSITIVITY OF NPV AND IRR OF THE PROJECT WITH RESPECT TO MARGINAL PROPENSITY TO SAVE OF THE BENEFICIARIES AT 10 PER CENT SOCIAL RATE OF DISCOUNT

Marginal Propensity to Save of Beneficiaries	Accounting Prices of Unskilled Labour and Fertilisers	
	NPV (in Rs lakh)	IRR (Per Cent)
0 29*	285 55*	8 54*
0 29	-1055 31	6 29
0 32	-1013 41	6 46
0 35	-971 73	6 61
0 38	-929 96	6 76

Estimated at accounting price of investment equal to unity and marginal propensity to save of the beneficiaries to 0 29

We see from Table 6 that the accounting price of investment has quite a significant effect on the NPV and IRR of the project, compared to the preceding position when only the combined effect of the accounting prices of unskilled labour and fertilisers were in the picture.[8] The NPV and IRR are reduced significantly. Both the benefits and costs in each year get pushed up with the use of accounting price of investment but the magnitude of increase in benefits is lower than in the costs. It may be postulated that the government might use or ought to have used some policy measures resulting into higher value of marginal propensity to save in the project region, so that the investment in the project could turn out to be socially profitable. In the light of this, we have examined what happens when shadow price of investment remaining the same, the marginal propensity to save is increased. Expectedly such step will increase potential consumption benefits stemming from increased reinvestment. The effect of increasing values of marginal propensity to save of the farmers and labourers, keeping the accounting price of investment constant at 1.50, on the NPV, B/C ratio and IRR of the project is presented in Table 7.

It is clear that the increase in marginal propensity to save of the farmers and labourers does not have significant effect on the profitability of the project. Though the value of NPV and IRR increases with the increase in the saving propensity of beneficiaries, at 10 per cent social rate of discount the NPV remains negative nevertheless even at such high propensity rate as 38 per cent. Clearly the very large magnitude of project's nominal capital cost when converted into its accounting value far outweighs the additional consumption benefits due to high rate of saving. At 38 per cent saving propensity while the costs increase by 50 per cent benefits increase only by 38 per cent.

To conclude, the economic profitability of the Western Gandak project at 10 per cent social rate of discount turns out to be negative. The IRR of the project in all the alternative situations remain below 10 per cent. The evaluation of the project, however, is not yet complete as the income redistributional effects of the project have still to be incorporated.

For the purpose of the present exercises the aggregate social consumption benefits is now comprised of two components: (1) the aggregate consumption benefits using accounting price of unskilled labour, fertilisers and investment, and (2) the aggregate consumption benefits resulting from applying the regional income distribution weighs to the total regional benefits. The results of the exercises with the two sets of distributional weights can be seen from Table 8. Irrespective of the choice between the two sets of weights the conclusion is that the project evaluated from the society viewpoint after giving higher weightage to the benefits accrued to the project region gives a fairly high social profitability. Assuming the value of 'e' to be (-1.50) the regional income distribution weight works out to 2.297. This means that a rupee worth of regional benefit has a social value of Rs 2.297. With this weight the NPV of social benefits at 10 per cent social rate of discount works out to Rs 11311.09 lakhs and the B/C ratio to 3.68. The IRR corresponding to this weight was 40.17 per cent. Using the simpler methods and taking the weight equal to ratio, (Ycr/Yr), the NPV of the project works out to Rs 4,708.52 lakh at 10 per cent rate of discount and the B/C ratio works out to 2.11. The IRR at this weight turns out to 23.36 per cent. Thus both the alternative ways of weighting regional benefits the investment in the project turns out to be socially worthy proposition.[9]

It is also clear from Table 8 that the ordering of the project's social profitability remains unchanged as one moves from one set of weights to the other. However, the value of NPV, B/C ratio and IRR appear to be unduly high with the weights obtained using 'e' in their estimation. In contrast their values appear to be quite reasonable when we use the simple ratio of the critical minimum social income to the regional income as the weight to be attached to regional benefits. From the methodology angle, therefore, the latter method seems preferable. Besides, it does not require the estimation of the parameter 'e' which is beset with theoretical and practical difficulties.

Summary and Conclusions

The present study is an attempt to make a comprehensive in-depth, ex-post evaluation of a canal irrigation system in a high rainfall and traditionally poor region like that of eastern Uttar Pradesh.

The commercial benefits and costs over the expected economic life (42 years) of the project are assessed at the market prices of relevant inputs and outputs. The results of the commercial evaluation shows that at 10 per cent rate of interest, which is the minimum interest rate currently charged by the financial institutions in India on term loans, the commercial profitability of the Western Gandak Canal Project turns out to be negative, with a net present value (NPV) of Rs (-)452.10 lakh. Expectedly, the B/C ratio is less than unity and the IRR 8.39 per cent which is less than the stipulated rate of interest.

Certainly, commercial profitability cannot always be a guide to social choice more so of an infrastructural project like the Main Western Gandak Canal Project. Accordingly, we have proceeded to assess economic profitability of the project based upon accounting prices of unskilled labour and fertilisers have been estimated using the linear programming Model II, which looks at the problem from the economy/society angle. These prices indicate the use value of the resource inputs from the society angle. With regard to accounting price of investment we have adopted the most reasonable estimates obtained by other studies. Taking the commercial profitability as the base, adjustments for the accounting prices have been made step by step.

At first, the correction for accounting price of labour makes the economic profitability for the project higher than its commercial profitability, though it remains negative at 10 per cent social rate of discount. On the other hand the correction for the accounting prices of fertilisers reduced the values of the decision criteria in comparison to their respective values in the commercial evaluation case.

The combined effect of the accounting prices of unskilled labour and fertilisers naturally settle the criteria values in the intermediate position. The NPV of social benefits of the project at 10 per cent social rate of discount remains negative at Rs 71.81 lakh. A comparison with commercial eval-

Table 8: Estimates of NPV, B/C Ratio and IRR of the Main Western Gandak Project, Using Shadow Price of Labour, Fertilisers, Investment and Regional Income Distributional Weights with $(Ycr/Yr)^e$ and (Ycr/Yr)

Regional Distributional Weights with $(Ycr/Yr)^e$				Regional Distributional Weights with (Ycr/Yr)			
Weights	NPV (in Rs lakh)	B/C Ratio	IRR (Per cent)	Weights	NPV (in Rs lakh)	B/C Ratio	IRR (Per Cent)
2.297	11311.09	3.68	40.17	1.61	4708.52	8.11	23.36
2.496	13219.60	4.13	46.39	1.46	3372.19	1.80	19.82
2.728	15500.92	4.67	56.54	1.33	2102.31	1.50	16.41
3.014	18263.74	5.33	82.62	1.21	948.00	1.22	13.02
3.368	21641.73	6.13	Exceeds 300 per cent	1.10	-101.32	0.98	9.70
3.805	25815.96	7.12	"				
4.346	31037.53	8.35	"				
5.048	37642.78	9.92	"				

* These weights are calculated using the following values of 'e' 1.50, 1.65, 1.81, 1.99, 2.19, 2.41, 2.65 and 2.92. Ycr is the per capita critical minimum social income (Rs 82.00) and Yr is the regional per capita income (Rs 47.10)

uation case shows that the adjustment for the accounting prices of unskilled labour makes a tremendqus improvement in the social profitability of the project but there is again a pull-back due to the accounting prices of fertilisers.

At the fourth stage we have made adjustment for the accounting price of investment both on the cost and benefit side of the project. In order to find out the reinvestment benefits, marginal propensities to save (MPS) of the farmers and unskilled labourers have been estimated by fitting consumption functions to consumption expenditure and income data obtained from our survey in the project region. The results of this exercise show that marginal propensity to consume (MPC) of all farmers and unskilled labour works out to be the same, i e, 71 per cent, which means marginal propensity to save (MPS) is 29 per cent. In the case of government the value of MPS has been assumed to be unity. The results of these adjustments, with accounting price of investment equal to 1.50 and the values of the saving propensities of the farmers, labourers and the government as just given, indicate that accounting price of investment has quite a significant effect on the NPV and IRR of the project compared to the third stage when only the combined effect of the accounting prices of unskilled labour and fertilisers were in picture. The NPV and IRR are reduced significantly. The benefits and cost both get pushed up with the use of accounting price of investment but the increase in benefits is lower than in the costs.

It may be postulated that the government might use or ought to have used some policy measures conducive to higher value of MPS in the project region. In the light of this, we have examined what happens when shadow price of investment remains the same while the MPS of farmers and unskilled labourers is increased. Expectedly, such a step will increase potential consumption benefits stemming from increased reinvestment. The values of decision criteria corresponding to these adjustments show that increase in ... does not have significant effect on the social profitability of the project. Though the values of NPV and IRR increase with the increase in the MPS of beneficiaries, at 10 per cent social rate of discount, the NPV remains negative even at such propensity rate as 38 per cent. Obviously, the very large magnitude of project's nominal capital cost when converted into its accounting value far outweighs the additional consumption benefits due to high rate of savings.

Besides doing the social evaluation from the regional economy viewpoint, social profitability with relevant distributional weights attached to regional income has been examined. The estimated income distribution weights show that at the smallest value of the weight, the social value of a unit of regional income is more than twice its nominal value. Since the value of elasticity of marginal utility of consumption is uncertain, for analytical interest, we have used both sets of weights, that is, weights involving and not involving elasticity of marginal utility of consumption, in order to see whether any difference is made as to the judgment about the worthiness of the project.

The incorporation of distributional effects in the social profitability pushes the decision criteria value in the positive and higher range of acceptability. At the lowest value of regional income distribution weight of 2.297, which is based on the method involving elasticity of marginal utility of consumption of -1.50 the NPV of benefits works out to Rs 11,311.09 lakh. The B/C ratio at 10 per cent social rate of discount works out to 8.68 and the IRR turns out to 40.17 per cent.

On the other hand using income distribution weight of 1.61 without involving elasticity of marginal utility of consumption in its estimates, the NPV and B/C ratio at 10 per cent social rate of discount work out to be Rs 4,708.52 lakh and 2.11 respectively. The IRR of the project corresponding to the above weight is 23.36 per cent.

In brief, the distributional objective rather than the accounting prices are critical for social worthiness of the project. And in the light of high social profitability including distributional effects the choice of the project, we may say in conclusion, has been well made.

Notes

[The author is grateful to S N Mishra for his valuable guidance and critical comments during the course of the study. The views expressed here are the author's.]

1 According to the Draft Annual Plan 1984-85, Uttar Pradesh, the re-revised project is under finalisation and the final cost of the project is estimated to be Rs 103 45 crore. The project was expected to be completed by the end of the Seventh Five-Year Plan. Due to non-availability of detailed data on yearwise actual cost incurred under the project during the recent years, it has not been possible to recast the estimates of IRR of the project. However, the fact that the final cost is higher than the cost estimates used by us and that actual utilisation of irrigation potential was lower than the irrigation potential utilisation figures used will have adverse effect on the values of decision criteria as worked out in the present paper and establish the veracity of our estimates. That is, the value of IRR will remain below 10 per cent under all types of situations and the project will remain profitable only on the income distributional grounds.

2 Marginal propensity to save (MPS) of the farmers and unskilled labourers have been estimated by fitting consumption functions to consumption expenditure and income data of the farmers obtained from our survey in the project region. For details, see, Singh R 1983, Chapter VI.

3 For details, see, Singh (1983: Appendix B).

4 Shadow price of fertilisers should really be the social cost of supplying fertiliser in the area. In the absence of any such estimate available for the area we have used the 'Use Value' approach for the purpose. In any case, shadow price of fertilisers (NPK) using the social cost of supplying NPK in the area would be positive and any price more than zero would further reduce the profitability from the economic and social point of view. This would further reinforce our estimates of decision criteria. Keeping the above in view, the exercise by ineluding social cost of supplying fertiliser has not been attempted.

5 While computing the economic costs and benefits, we have not estimated the contribution of the project to the self-sufficiency objective. This was done because the project did not directly involve the foreign exchange component of the cost. Though, there are certain inputs like cement, steel, etc, which had been used for the construction of various components of the project, the detailed yearwise data on quantity of such inputs used were not readily available even with the project authorities. Thus, on the cost side, shadow price of foreign exchange could have been used to estimate the economic costs of these inputs and the ultimate impact could be towards increasing the investment cost of the project. However, in view of the non-availability of requisite data, it has been implicitly assumed that the market prices of the above inputs reflect the scarcity values.

On the benefit side, it could be argued that the project results into additional production of crops like paddy (rice), wheat, sugarcane (sugar), etc. These could be treated as minor traded goods. Again for these goods, market price was assumed to reflect the true value from the economy viewpoint. Adjustment for the foreign exchange premium using shadow price of foreign exchange would have enhanced the economic benefits. However, this type of adjustment would be necessary at the farm level input cost also such as fertilisers, insecticides and pesticides, etc.

Thus, adjustment for foreign exchange premium at the project-level costs (cement, steel, etc) and farm-level costs (fertilisers, insecticides and pesticides, etc) would have pushed up the cost, while adjustment at the benefits-level would have increased the value of benefits. The author is of the view that under such a situation values of decision criteria would have remained at the level when no adjustment was made for foreign exchange benefits and costs.

6 Though, the project contributes to the social as well as regional per capita incomes, the latter contribution would be relatively larger. This is because the regional population compared to the national population is very small.

7 This happens because the marginal farmers including the landless households in the size group 0-2.50 acres account for 72 per cent of the total sample households and have about 28 per cent of the total land in the sample villages.

8 Mrinal Datta-Chaudhari and Amartya Sen (1967) have applied the shadow price of investment to capital costs and reinvestment benefits simultaneously and found that shadow price of investment does not have any significant effect on the NPV of the project in their case.

9 One may argue that for the purpose of etimating income distribution weights, instead of taking national per capita income as the critical minimum income, it would be more appropriate if we take per capita of the poorest region in the state of Uttar Pradesh or the per capita income of the state which has got the lowest per capita income In the latter case per capita income of Bihar state was lowest at Rs 773 (current price), which was still higher than the per capita income of Rs 565 worked out for the project region. This implies that value of income distribution weight would be higher than unity (1.37 without taking into account 'e') and the corresponding value of IRR would be much higher than 10 per cent which would indicate that investment in the project was socially profitable (the conclusion drawn when national per capita income was taken as the critical minimum). In the former case, it may be mentioned that net domestic output per capita at current prices (1976-77) was estimated to be Rs 606.14, Rs 524 60, Rs 408.20, Rs 555.10 and Rs 708.28 for western region, central region, eastern region (project lies in this region), Bundelkhand region and Hill region respectively. Expectedly, the per capita income/net domestic output at 1978-79 prices (our estimate of per capita income relates to this year) would be higher than the per capita income of the project region in respect of all the other regions in the state. This would mean that value of income distribution weight would be more than unity, which in turn, implies that the ranking of the project or the project choice as obtained from our existing income distribution weights would remain unchanged.

Oman International Bank S A O G

Schedule 17—Principal accounting policies forming part of the accounts for the year ended 31 March, 1994

Principal accounting policies:

i) General

The accompanying financial statements have been prepared on the historical cost basis and conform to the statutory provisions and practices prevailing in the country

ii) Transactions involving Foreign Exchange

(a) Monetary assets and liabilities have been translated at the exchange rates prevailing at the close of the year

(b) Income and expenditure items have been translated at the exchange rate ruling on the date of the transactions

(c) Profit or loss on forward contracts have been accounted for on accrual basis

iii) Investments

In accordance with the guidelines issued by the Reserve Bank of India the investments of the Bank have been bifurcated into "Permanent Investments"—which are normally held upto the date of maturity and Current Investments"—which need not be held upto the date of maturity In respect of Permanent Investments the difference between the redemption value and cost of acquisition of the Investment is accrued as profit/loss over the period upto the date of redemption In respect of Current Investments other than Treasury Bills the same are valued at cost or market value whichever is lower The loss on revaluation is charged to revenue

Treasury Bills are valued at cost The Market value of other Current Investments is Rs 15 30 crores (Cost Rs 14 95 crores) The Market value of other Current Investments has been worked out by means of an appropriate capitalisation of yield method as recommended by the Reserve Bank of India

iv) Advances

a. Provision for Doubtful advances is based on the classification into 'performing" and 'non performing assets in accordance with Reserve Bank of India guidelines Provision for non performing assets is made as under

Sub standard assets	- 10 % of net advance
Doubtful assets	— 100 % of the unsecured portion and 20% to 50% of the net secured portion depending on the period for which the asset has remained non performing
Loss assets	- 100%

The provisions so required by the Bank have been made after considering the provisions existing in the books of the Bank as at the end of the Previous Year

b Provisions in respect of doubtful advances have been deducted from advances

c Provisions have been made on a gross basis Tax relief which will be available when the advance is written off will be accounted for in the year of write-off

d Interest on advances classified as non performing has been credited to Interest Suspense account as specified under the guidelines issued by the Reserve Bank of India Advances are reflected at net of interest suspended

v) Fixed Assets

a Fixed Assets other than Premises have been accounted for at their historical cost Premises have been considered at their revalued cost

b Leasehold Premises have not been capitalised Lease rentals paid during the year have been charged to revenue account

c Depreciation has been calculated on a straight line basis to write off the cost of fixed assets over the expected useful lives of the assets duly certified by the management The principal periods used are

Premises	25 years
Furniture and Fixtures	5 years
Equipment	5 years
Motor Vehicles	5 years
Computers	5 years

The depreciation on additions to Fixed Assets made during the year has been charged on the basis of completed months following the month in which the additions are made The depreciation provided on the above basis is higher than the depreciation computed in accordance with Schedule XIV of the Companies Act 1956

d Depreciation including additional quantum of depreciation on revalued assets has been charged to the Profit and Loss account

vi) Staff Benefits

a. Contributions to Gratuity Fund have been made on an accrual basis on the computation by the management of the Bank A separate Fund for Gratuity has been created which has been recognised by the Commissioner of Income Tax

b Contributions to Superannuation Fund have been made under Group Insurance Scheme of Life Insurance Corporation of India An application for the approval of the Fund has been made to the Commissioner of Income Tax which is awaited

vii) Net Profit

The net profit disclosed in the Profit and Loss account is after considering

a Provisions for taxes on income in accordance with statutory requirements

b Provision for doubtful advances

c Head Office Administrative Expenses to the extent estimated to be allowable under Section 44C of the Income Tax Act, 1961

بنك عُمان الدولي ش م ع ع

Oman International Bank S A O G

Schedule 18—Notes forming part of the accounts for the year ended 31 March, 1994

1 Additional depreciation charged on revalued assets which hitherto, was being recouped by transferring a like amount from the Revaluation Reserve has, from this year, been charged to the Profit and Loss account Consequent to the change in the basis of accounting of depreciation, the depreciation charge for the year is higher by Rs 1,191 843 (includes Rs 191 489 in respect of Previous Year) and the profit for the year is lower by the like amount

2 The Bank has been served with a Notice of Demand relevant to the Assessment Year 1991 92 of Rs 40 79 crores from the Income Tax authorities The Bank has made the necessary application for rectification of the Assessment Order and has also preferred an Appeal before the appropriate authorities Based on certain documentary evidence which has been filed while making the rectification application and also considering certain matters which in the previous assessments have been decided in the Bank's favour, the Bank is hopeful of a favourable rectification/appeal Order reducing its Income Tax liability substantially The Income Tax provision presently held by the Bank for the relevant Assessment Year is considered adequate to meet its tax liability

3 Inter Office accounts include an amount of Rs 16 903 516 brought in as initial remittance for acquisition of premises, fixed assets and start-up expenses and Rs 15 850 665 remitted from time to time for acquisition of premises for the use of the Bank

4 On the basis of the Valuation Report of the approved valuer the Bank has revalued its Office Premises in a commercial Co-operative Society on 31 12 92 The increase in value of the Premises arising out of the revaluation has been transferred to Capital Reserve under the head 'Revaluation Reserve

5 The Accounts for the year reflect the Indian operations of the Bank covering its existing Bombay Branch and Cochin Branch which commenced its operations on January 03 1994 Accordingly the Current Year s figures are not comparable with those of the Previous Year

6 Figures of the Previous Year have been regrouped/rearranged wherever necessary

Auditors' Report on the Indian Branch of Oman International Bank S A O G

We have audited the attached Balance Sheet of the Indian Branch of Oman International Bank S A O G as at 31 March, 1994 and also the annexed Profit and Loss Account of the Indian Branch of the Bank for the year ended on that date in which are incorporated the returns from Cochin Branch, audited by us

In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949, read with the provisions of sub sections (1), (2) and (5) of Section 211 and sub section (5) of Section 227 of the Companies Act, 1956, the Balance Sheet and the Profit and Loss Account, are not required to be and are not drawn up in accordance with Schedule VI to the Companies Act, 1956 The accounts are therefore drawn up in conformity with Forms 'A' and 'B' of the Third Schedule to the Banking Regulation Act, 1949

We report that in accordance with sub-section (3) of Section 30 of the Banking Regulations Act 1949

a) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purpose of our audit and have found them to be satisfactory

b) The transactions which have come to our notice have been in our opinion, within the powers of the Indian Branch of the Bank

c) In our opinion, proper books of account as required by law have been kept by the Indian Branch so far as appears from our examination of those books and proper returns adequate for the purpose of our audit have been received from the Cochin Branch of the bank

d) The returns of Cochin Branch have been properly dealt with by us, while preparing our report

e) The Balance Sheet and Profit and Loss Account of the Indian Branch of the Bank dealt with by this report are in agreement with the books of account and the returns

f) There is a change in the method of accounting of additional depreciation on revalued assets resulting in a charge for depreciation being higher by Rs 1,191,843/- and profit for the year being lower by the like amount (Refer Note 1 of Schedule 18)

Subject to the foregoing in our opinion and to the best of our information and according to the explanations given to us, the Balance Sheet and Profit and Loss Account, read with the Principal Accounting Policies appearing in Schedule 17 and read together with Note 2 regarding Income Tax Demand and other Notes appearing in Schedule 18, give the information required by the Companies Act 1956 in the manner so required for Banking Companies and give a true and fair view of the state of affairs of the Indian Branch of the Bank as at 31 March, 1994 and of its profit for the year ended on that date

DISCUSSION

A Secular Muddle?

Niranjan Phukan

ONE is grateful to Andre Beteille (*EPW*, March 5, 1994) for opening a debate on the vexed question of secularism with refreshing candour and boldness. But one can hardly say he has dispelled the fog surrounding it. Indeed, one regrets that his exercise might provide theoretical underpinning to the thoroughly dishonest and unprincipled compromises of the present Indian government. This is most peculiar.

Secularism may be discussed and argued about by an intellectual minority, as Beteille believes. Perhaps I would not get a ticket to join that august minority. But I share the risks and anxieties of the common man that confusions about secularism generate. Not so long ago, within 30 kilometres of a place where the governor and the chief minister of my state (Assam) were taking fervent part in a Tantrik 'yagna', the army had dragged five young men out of their homes and shot them like pigs on the merest suspicion that they might have been involved in a terrorist murder. On April 14, a huge concourse of Muslim peasants and day-labourers assembled for three days in a 'World Iztema' at a place rocked by bloody communal carnage following the Babri masjid outrage. The chief minister and other members of the cabinet sought the blessings of the 'Iztema'. The RSS is reportedly planning a counter-demonstration in the vicinity.

Beteille attacks the semantics of the term 'secularism' by pointing out that its meaning is in fact inexhaustible, and that it is wrong to think it "can be given only one correct meaning". One suspects this limp liberalism and prefers the Bakhtinian notion that each keyword is actually a battleground of antagonistic class forces. Beteille lays his cards on the table to claim that unlike a theologian a sociologist is compelled by the logic of his discipline to be impartial to all religions. It is not quite clear if he wants all of us to abandon our other concerns and turn sociologists. The difficulty is that his colleagues might consider such company vulgar, and the benighted masses might be too besotted to be charmed by sociological enlightenment.

Beteille concedes that secularism is a doctrine and programme pushed by an assorted company of liberals, socialists and communists, but doubts if their efforts are of much worth. Secularism is in his opinion much more the product of a century of silent but massive social change characterised by 'secularisation' which is further described as a "universal tendency of the modern world". Fine. But what should bother us is that with the discomfiture of the left-liberal gang at present, militant fundamentalism has become the most striking phenomenon in many countries in our 'post-modern' world!

In Beteille's account secularisation has led to "the decline of many ritual observances", but not "to the decline of all religious beliefs and values". For example, Hindu ritual adherence to purity/pollution rites has dwindled, but not Hinduism as such. Actually, he goes on, many such ritual observances have magical origins, which have been undermined by secularisation.

Has the silent march of secularisation taken place without such violent ruptures as (to confine ourselves to our country) introduction of a new legal system, introduction of a new education system replacing the old, bitter struggles against 'suttee' and child-marriage, the struggle of the dalits, etc? Is that struggle now really over? What about the spate of *new* 'yagnas' for such sundry ends as ensuring world peace and toppling P V Narasimha Rao? What about the eruption of ritualistic Muslim legalism?

As part of the process of secularisation Beteille cites the growth of such secular institutions as banks, hospitals, universities, etc. One wonders why he does not mention the biggest and most powerful of such secular institutions—courts of law and the legal system. In India the battle for a secular legal system is far from over. If that battle is lost, the other institutions mentioned by him will soon follow suit. The sociological enlightenment ignores the struggle for liberalism and democracy that has brought about secularisation.

In Beteille's view both dogmatic religion and doctrinaire secularism err by making holistic claims for their own platforms. Secular intellectuals are worried by a concept of religion spreading its tentacles to every aspect of every individual's life. On the other hand there are doctrinaire secularists who are totally biased against religion and take perverse pleasure in exposing magic and superstition in religion. They ignore the fact that religion in its legitimate sphere "addresses fundamental questions of birth and death, misfortune, suffering, and renewal of life." That is a sectarian view. What is desired, according to Beteille, is accommodation between the two. Holism is out. Pluralism is in. It follows that the "co-existence of secular and religious ideas and institutions" is the ideal state of affairs. After all, the simplest of societies had known the relative autonomy of certain aspects of life from religious influence and control. Further, in a country like India, the co-existence and mutual tolerance of several faiths have been "a fact of historical experience". If the totalising claims of each religion is conceded, such historical experience loses its value. Hence accommodation in an undoctrinaire fashion between different religions, and between religion and secularism, is the only way out.

The problem in our opinion is one of political philosophy (if one does not like the word 'ideology'). It implies such issues as mutual attitudes between the state and the citizen and between the state and religion. It is deeply related to the protracted struggle for a democratic state against feudalism. The battle ended in Europe and America with the demarcation of the private and the public spheres. Decline of magic ritual and the power of priesthood guarding such rituals led to the enlargement and strengthening of the sphere of private worship and conscience. On the other hand, the public sphere is taken over largely by the state, and to some extent by voluntary associations. In India the paper document of a Constitution could not settle the dispute, which has now begun to rage with elemental fury.

Therefore the question of political hegemony cannot, should not be evaded. Whatever fundamental questions are addressed by religion it must not on that account be allowed to command an overriding allegiance from its members/followers. In the public sphere the state must in the last resort be the sovereign power, commanding primary loyalty. Therefore it is not sweet accommodation but the coercive power of the state that must ensure that religion does not interfere with or encroach upon the political obligations of the citizen and his respect for laws of the state. Even the accommodation among different religions, their mutual tolerance, may have to be ensured by such an authority. This coercive power is based not on brutal whim, but on legitimate, principled authority with the consent of the citizen. The rise of such state authority is no result of an unconscious process, but that of a conscious struggle which established the hegemony of certain forces.

The much-maligned secular intellectuals, reviled by born-again scholar-sadhus and scholar-pirs, have only taken this stand. Few of them have been so mad as to demand the abolition of religion. Secularism is to them no dogma, but an essential condition for preservation of democracy. It has therefore an unavoidable political content.

On the other hand, the actual Indian state, instead of confronting the mounting threats to democracy, has begun to fumble and founder (as before and during the shameful Babri masjid episode). Religious forces are unleashing a campaign for restricting the sovereign power of the state and undoing the work of democratic forces. Admittedly that work had at best been half-hearted. But to abandon that legacy will be to throw our people to the mercy of ravenous wolves. On the other hand, those among us who are for such an abdication by the state must be fought as enemies of the people.

The democratic state comes to birth along with a new stage in the development of religion. Beteille has rightly rejected an essentialist view of religion, but he fails to adopt a historical position. Is it because accepting history means choosing and taking sides?

Roja in 'Law and Order' State

S V Srinivas

TEJASWINI NIRANJANA's article ('Integrating Whose Nation? Tourists and Terrorists in *Roja*', *EPW*, January 15) and the response by Venkatesh Chakravarthy and M S S Pandian ('More on *Roja*', *EPW*, March 12) have quite correctly focused on the political significance of Maniratnam's much-dubbed film.

Released at a time (latter half of 1992 in Tamil and Telugu) when the Hindu right's rhetoric on Kashmir and Muslims was more strident than ever before, the film also coincided with the government's claim to have successfully solved the 'Punjab problem'. This was also the time of increased state repression in Andhra Pradesh, Assam, Bihar, Gujarat, tribal areas of Maharashtra, Madhya Pradesh and Kashmir itself. All these states (except Gujarat) apparently suffered from 'terrorism' and the governments of the states and centre were busy 'tackling the extremist menace' with a variety of brutal, unconstitutional means. ULFA and PWG were banned earlier as were RSS, VHP and Bajrang Dal later. The response of the state to the right was exceptionally wild while scores of people lost their lives due to their alleged association with ULFA and PWG. As has been pointed out by Tejaswini Niranjana, in Tamil Nadu too there was a crack down on 'terrorists' which in reality meant suppression of Sri Lankan Tamils and their supporters in the name of twisting the latest 'foreign hand', LTTE.

On the other hand, the regime's obsession with privatisation and liberalisation, Bank-Fundism's most visible manifestations, was acquiring a concrete, irreversible form. Even while the state withdrew from its economic and social obligations, armed and ruthless intervention in a broad spectrum of oppositional movements became the order of the day. Interestingly, emphasis is now being given to 'people's participation' even in law and order maintenance. As a result, Delhi police spends lakhs on appealing to the 'public' to help fight 'terrorism', 'drug abuse', and 'communalism'. This new-found mania for 'broadening the base' for policing does not prevent the government from raising a well-trained (read armed to the teeth) force to guard privately owned tea estates in Assam.

It is possible to argue that today, even while the state grows increasingly repressive, it is reducing its sphere of activity and rapidly confining it to maintaining law and order.[1] The ruling class-caste elite has been demanding precisely this. There seems to be a 'contradicton', in the sense of a *double bind*, in the state's functioning. Commenting on *Roja*, Tejaswini Niranjana and Chakravarthy and Pandian have emphasised on seemingly opposing pressures of the same process. In the film, there is thus at once "a rejection of the Nehruvian state which had been compelled to write in its policies a vision of democracy and egalitarian socialism" (Niranjana), and the ultimate victory of the "state and Hindu-patriarchal culture" (Chakravarthy and Pandian) The question I would like to address is how *Roja*, released at the crucial moment when the Nehruvian state was dismantled, reacts to the transformation mentioned above that strengthens the repressive arm of the state and drives it out of every other sphere of activity.

Roja interpellates the 'common man', upper-caste-middle-class male really, to protect 'national interest' by fighting terrorism. The correspondences between family and nation (Chakravarthy and Pandian) serve to 'bring home' larger problems like terrorism by turning abstract concepts like national security into immediately recognisable ones like family well-being. Such a relationship between the subject and nation renders irrelevant any other kind of commitment except (and this is where the film takes the cake) in the most mechanical and cliched terms. The moral: fight terrorism or *your* family will go to the dogs. This in itself is not new to Indian cinema (two decades ago *Deewar* merged the interests of the family with those of the nation—the errant son was also a criminal). In the recent past, the essential cinematic problem has become protection of the family (not necessarily nuclear family).[2] Maniratnam's *Dalapathi*, which preceeded *Roja*, is all said and done, a highly unimaginative film on the Hindu family. Family in films is itself becoming more oppressively patriarchal in the course of these developments.[3] Maniratnam therefore has at his disposal a rich film intertext which has already made the equation between family and nation-state, by extension heroism as a fight for both.

What is new about this film is the blatant equation of the Muslim with terrorism. If anything, Indian film-makers have gone to ridiculous lengths to say 'Hindu-Muslim (or Hindu-Sikh) Bhai- Bhai' and blame the foreign hand's agents, generally maniacal individuals, for the trouble. In *Roja* the foreign hand is very much in the background but more visible is an identifiable ethnic-religious community actively engaging in terrorism.[4]

Thanks to the intertext available on *what* terrorists do, the director leaves this largely to the audience's awareness of state propaganda and its manifestation in cinema (scores of films have been made in Tamil, Telugu and Hindi on this subject). Instead the focus is on *who* they are (Muslims) and one of their 'victims'. Through this victim and his beloved, the 'common man' is interpellated to save the nation and family.

Maniratnam employs two important techniques, star casting and film cliche, to force the closure of the film which, to quote Chakravarthy and Pandian, is 'orgasmic'. It is a fulfilment of Rishi Kumar's desire to be reunited with Roja and the middle class fantasy of saving the nation.

Film is generally watched and interpreted in the context of a long history of film-viewing. The audiences are always already conscious of a history of cinema, its actors, plots, genres and cliches. This consciousness is highly 'productive' as film-makers may build on expectations or play with them. When it comes to actors, especially recognisable ones, no matter what role s/he plays in the present film, there are 'images' already available to the audience in the light of which the new role is received.[5] Part of the 'pleasure' of watching films is precisely this interaction between what we are conscious of and what is being offered.[6]

In *Roja* the 'image' of the stars is used by Maniratnam to force, at least partially, the movement of the film towards its conclusion. This is Madhubala's (Roja) first film in Tamil. Her *Phool Aur Kante* (Hindi) was already a major success by this time. She was thus either unknown in southern India or known as a sexual object (*Phool Aur Kante*). In both cases she could quite easily function as the "ideal site of unlimited desire" (Chakravarthy and Pandian). Arvind (Rishi Kumar) appeared in Maniratnam's previous film, *Dalapathi*, as a responsible IAS officer and ideal son (the errant bastard being Rajanikanth). He also beats his half brother in the race to marry the heroine. He is thus recognisably responsible, sophisticated and successful. He can solve the nation's pressing problems and resolve the film's crisis. Pankaj Kapur (Liaquat) is new to south Indian cinema but he is of course Karamchand, the carrot-eating crime-buster of Doordarshan's first detective serial (available at least to urban middle-class audience). He is a good man really and as the authors of the earlier article have pointed out, not threatening for other reasons as well. Nationalism (and patriarchy) has already won half the battle.

As in Maniratnam's earlier films, Liaqu[at] is the hard-core criminal who undergoes change of heart (*Nayagan, Dalapathi*). Needless to say, the audience is fully aware of the possibility of such a change even before the film begins.[7] As pointed out by Chakravart[hy] and Pandian, the ideological battle is lost [by] the terrorists when the director seals the li[ps] of Liaquat beyond a few outbursts [of] 'aazadi', while Rishi mouths familiar expl

tives against violence, foreign hands, innocent victims and negotiating tables. Something similar happens in *Nayagan* where the protagonist looks appropriately apologetic when challenged by his daughter.

Likewise, film cliches[8] serve to force a resolution of the crisis (Kashmiri nationalism, separatism, fundamentalism) threatening the nation's being. As we have seen, much of the problem has already been solved. The issue of whether hostages should be exchanged is clinched by the employment of the age-old film cliche of 'action'.[9] The hero fights his way to justice, safety and happiness ever after. But for the 'action', the film would have to end in Rishi's death or the defeat of the army's stand against the exchange of hostages. If Rishi were to die, the army would be seen as insensitive. A part of the audience might go home thinking that hostages *should* be exchanged for humanitarian reasons. If on the other hand the exchange is made, the army would lose face and, worse, the audience might view such exchanges as attractive solutions to similar problems. Very unattractive and 'dangerous' alternatives indeed for the director. Thanks to the 'action', firstly the army's stand is vindicated and, secondly, Roja's plea to the minister and the government's climb down are rejected as incorrect and dangerous, if sentimental. Roja is a woman and the minister a politician, after all Indian cinema today denies politicians (who generally appear as corrupt, cruel, etc) the role of spokespersons of the state's point of view. The army alone is being projected as the authentic voice of the state.[10] Here the conflict is not between two representatives of the state but between one authentic representative and an unpatriotic (even if avancular) opportunist. There are numerous caustic references in the film to the exchange of hostages by the V P Singh government.

The film thus slickly packages state propaganda and "helps to legitimise army activities such as search operations, the interrogation of 'terrorists' and the shooting of them".[11] *Roja* calls for more rather than less armed intervention of the state. It criticises the 'softness' of the regime in its handling of terrorism and projects the army as a true friend of the patriotic people. The upper-caste-middle-class, as in other spheres of activity, is now mature and willing enough to do its bit in helping the state in its peace-making activities. It is now up to the government of India to invite the tenders and take the nation into the 21st Century.

Notes

[A] K Sengar, Deepak K Singh and P K Kim watched the film only to discuss it with me. Gopinath and the two Pradeeps had discussions with me on terrorism and on *Roja* in Malayalam. C T Manlong discussed representations of the army in recent Hindi films. Finally, all the above forced me to tone down what one person called my 'obsession with stars'.]

1 K Balagopal and others in the Andhra Pradesh Civil Liberties Committee have for sometime now been pointing this out in their public statements. I am indebted to the APCLC for this analysis of the state's transformation in the recent years.

2 Witness for instance the development in Telugu cinema: the leading actor Chiranjeevi's recent films *Lankesh Warudu* (1989), *Gang Leader* (1991) and its Hindi version *Aaj Ka Goonda Raj* (1992), *Gharana Mogudu* (1992) and *Mechanic Alludu*; Krishna's *Pachchani Sansaram* (1993) and *Number 1* are films about protecting the institution of Hindu family. Interestingly, there is an overlap of genres: 'family' films and 'action' films are fused.

3 I cannot discuss this at any length here. I shall only point out that as a part of our project, 'Mass Culture and Its Audience: Video Cinema in Arunachal Pradesh', we (Deepak K Singh, J L Dawar and I) asked film-goers what they 'learnt' from Hindi cinema which is very popular here. A majority of the male respondents said they learnt to "take care of the family", "be responsible sons/brothers", etc. The most popular film on video circuit in the recent past is the Mithun starrer *Sansaar*. I fully agree with the findings of Chakravarthy and Pandian on the linkages between family and the state, built into cinema. My point is, this predates *Roja*.

4 See Rajeev Velicheti, 'Women, Violence and Telengana in Contemporary Telugu Cinema' (presented at the Anveshi/Subaltern Studies Conference on Subalternity and Culture, January 1993). In a one page 'Note on Roja', he points out, "The film can be seen as a Hindu communal film potraying Muslims as perpetrating mindless and self-generating violence. A tune similar to prayers offered at namaaz, accompanied by thumping drum beats, follows the terrorists on the audio-track. The terrorists...are repeatedly doing namaaz and uttering the name of 'allah'" (p 13).

5 In the recent past the Hindi actor Shah Rukh Khan seems to have benefited most from such a manipulation by playing what is called a 'negative lead role'. *Baazigar* and *Darr* (1993), for example.

6 There is also another side to this. Maniratnam has himself remarked, "Stars are a burden; the bigger their image, the bigger your responsibility of not going against what the audience expect of them" (Khalid Mohammed, "Mani Matters", *Filmfare*, January 1994, p 64). In the summer of 1993, fans of the Telugu actor Krishna are reported to have 'boycotted' his film *Varasudu* because he was cast in a 'negative role'.

7 To cite another example, in Feroz Khan's films the other hero has to die (*Qurbani*, *Jaanbaz*, *Dayawan*).

8 By film cliche, I mean arrangement of sequences which can be recognised as 'song', 'fight', 'flash back', etc. Not in Esenstein's sense of a predictable *emotional* effect of shots in a montage (Film Forum, pp 60-61).

9 See also *Damini* for the deployment of an 'action-hero' to resolve the women's question.

10 See *Prahaar* and *Tirangaa* (Hindi), *Dauthyam* (Malayalam), and *Aagraham* (Telugu) for the army's representation as the only solution to terrorism or crime which is more often than not abetted by politicians.

Social Indicators of Development for India – I

EPW Research Foundation

THE objective of this note is rather a limited one which is to present a set of data for over a period of years on as many important indicators of socio-economic development for India as possible and incidentally make a brief comparison of these data with similar data for a select few other developing and semi-industrialised countries.

Undoubtedly India is one of the few countries that can take pride in possessing a fairly decent statistical base on different social and economic indicators of development and that too at disaggregated levels by social groups, regions and some by districts or even by lower levels of administrative units.[1] Apart from the mass of social and economic data departmentally generated and published periodically by the respective official departments and ministries, as also by the Central Statistical Organisation (CSO) which undertakes the tasks of co-ordination and dissemination of official economic and social statistics[2], the roles of the decennial Census and the Sample Registration System (SRS) of the Office of the Registrar-General and Census Commissioner, India and the National Sample Survey Organisation (NSSO) have come to be recognised as pivotal in the kind of nationwide sample surveys undertaken by them on different quantitative and qualitative dimensions of socio-economic development in India.[3]

Nevertheless, the task of presenting a consistent picture of the evolving socio-economic scenario of the Indian population over the decades/quinquennia of the planning era, is not an easy one. In the first place, the social statistics put out by the official agencies are scattered over a number of sources and due to the absence of uniformity in periodicity and such other issue, any standardised presentation of even such key indicators as population statistics, data on fertility and mortality, health and education indicators, and indicators of employment, unemployment, poverty and levels of living, is indeed difficult. The Five-Year Plan documents also do not present any consistent and comparable picture over different plan periods. Though the CSO has been producing since 1987[4] an annual publication entitled *Selected Socio-Economic Statistics for India*, this has not been enough of a source to present a fuller coverage of the various socio-economic facets of the Indian population.

Secondly, a striking aspect in the various sets of social indicators is the significant divergence in absolute numbers or relative ratios concerning specific characteristics. Many of these divergences are inevitable as they are ascribable to source differences, differences in reference points and above all differences in concepts and methodology of compilation. The differences in various concepts and definitions employed by the Indian Censuses, say, in regard to rural-urban distribution of the population, or in regard to worker participation rates of males and females, and now in the 1991 Census on literacy rates, have made it necessary to be cautious in attempting any straight comparison of the data over different Census decades.[5]

Some of the differences even in such simple data as population size can be indeed glaring. The population of India as on March 1, 1991 based on the year's decennial Census was placed at 846.30 million (including the projected population of 7.72 million for Jammu and Kashmir where the 1991 Census was not conducted) but post-Census evaluation survey conducted may indicate, according to the Census Commissioner himself, an under-enumeration to the extent of about 1.8 per cent which was so in the 1981 Census and hence he has estimated the country's population at 861.4 million for the same period [Nanda 1992: 9] though it has not been a practice in demographic literature to take cognizance of it.[6] To an extent, even the growth rates of population based on inter-Censal comparisons, namely, 24.66 per cent during 1971-81 or 2.22 per cent per annum and 23.85 per cent during 1981-91 or 2.16 per cent per annum, do not appear to correspond (even after making allowances for estimational differences) to the natural growth rates obtained from the Sample Registration System for all the individual years from 1971 to 1992 (see *Sample Registration Bulletin*, December 1992 and January 1994). Sometimes the sample surveys fail to capture accurately the vital aspects of population characteristics. For instance, a comprehensive analysis of the Sample Registration System up to the year 1988 undertaken by the Registrar General's Office (1991) concludes that "in rural areas, female mortality is of the same order as male mortality. In urban areas, however, the female mortality is lower than the male mortality" (p 37).[7] Similarly, the same report suggests that at the all-India level the infant mortality rate for female children during 1988 was lower at 93 infant deaths per 1,000 of live and still births, whereas for male children, it was higher at 95 infant deaths (ibid, p 40). The inter-state differences cannot fully explain this situation[8] because, as brought out in a subsequent paragraph, the female-male differential is acutely tilted against females in the largest states of central, eastern and northern India. Besides, elsewhere there is evidence to the effect that under-5 mortality for India for 1991 was 125 per 1,000 live births for female children and 123 for male children [World Bank: 1993].

Be that as it may, an attempt has been made to present in Table 1 various social indicators of development for India for certain landmark years in a synoptic form beginning from the pre-Plan period based essentially on official sources. In this vast array of statistics, there are flow figures pertaining to relevant financial years, stock figures for the period-end and data on certain social characteristics obtaining during or at the end of the year (such as crude birth and death rates or literacy rates). While almost all data pertain to the years under which they are indicated there are however some sets of data which relate not to the very years but those close to the years specified in the table due to the availability of data only for some benchmark years. (For example, the quinquennium NSS data for 1983 are presented against 1984-85 or the 1987-88 NSS data are presented underneath 1989-90.) While the sources of data have been indicated in the table, various descriptions regarding their nature and quality as also the necessary qualifications and provisos on them which may be contained in the original sources have not been reproduced here in their entirety. The data presented in this note are thus intended only to indicate a broad picture of India's progress as depicted by the evolution of social indicators over a span of 45 years or so.

The country's estimated population at 878.6 million as on March 1, 1993 derived from the base figures of the 1991 Census does not include, as highlighted above, the possible under-enumeration in the Census. That apart, there are now distinct signs that acceleration in population growth which has been a feature during the past three decades has been arrested since the middle of the 1980s. All indications, as brought out by the SRS data up to the year 1992 [Registrar General 1994] and those by the Standing Committee of Experts on Population Projections (October 1989) suggest that a distinct declining trend in the country's natural growth rate in population (from 21.3 per thousand population in 1987 to 19 in 1992) is discernible since 1987-88 and this is by and large attributable to the receding of the country's crude birth rate. Hence the Eighth Plan assumption of 1.78 per cent growth per annum during the period 1992-97 may well be realised almost for the first time in the history of India's five-year plan formulation. The crude birth rate (number of live births per 1000 population in any given year), which remained almost stagnant for about a decade and a half until 1986 at around 33/34 per thousand population despite some increase in the couple protection rate (i e, per cent of couple protected by various family planning methods) during the period, say from 16.3 per cent in 1973-74 to 35.6 per cent in 1984-85, has declined from about 32.2 births per thousand population in 1987 to 29 births in 1992 (*Sample Registration Bulletin*, January 1994). The decline in birth rate as well as the natural growth rate has been sharper in urban areas than in rural areas. Though The Planning Commission (1992) claims that the acceptance of family regulation has been more effective in older age-groups as reflected in the marked decline in fertility in the age-group of 30-44 years and much less in the

age-group of 15-29 years, this ignores the fact that the most effective method of couple protection is found to be the "terminal" method opted for by the older age-group as any other effective and reversible contraception is not available. It is reported that the second half of the 1980s witnessed the beginning of a new phase of fertility decline, with the total fertility rate (the average number of children born per woman in a woman's entire span of reproductive period) declining, after a decade of stagnation, from 4.5 in 1984-85 to 3.6 in 1990-91. Reports based on the SRS have ndicated that more refined measures of fertiity, namely, general fertility rate (number of ive births per 1000 women in the reproductive age-group of 15-49 years) and the general narital fertility rates (number of live births per thousand married women in the same eproductive age group) have shown sharper leclines [Registrar General 1991].

The arresting of the population growth rate luring the 1990s is of course largely due to the lecline in the crude birth rate but data do uggest that a surprising arresting of the pace f decline in the crude death rate has also layed a role in it. In fact, the SRS data idicate that the crude death rate has tended to nove up in the early 1990s both in rural and rban areas, that is, from 10.5 deaths per 1000 opulation in 1990 to 10.8 in 1992 in rural reas and from 6.8 to 7 in urban areas. After aching the lowest rate of 9.7 in 1990 from ound 15 in the early 1970s and 12.5-11.8 iring 1981-85, the crude death rate has ben to edge up to 9.8 in 1991 and 10 in 1992. he Eighth Plan expects that at best it may fall 8.7 by 1996-97. Also, as a result of the rsistence of many disabilities in the social ctor, such as a relatively high rate of infant ortality and maternal mortality and substanl gaps in the health infrastructure, the improvement in expectation of life at birth, as vealed by the Sample Registration System, ring the latter half of the 1980s has been less an that during the 1960s and 1970s through e mid-1980s [see also Nanda 1992] This pears to be somewhat natural, for after aining certain levels of life expectancy of und 57/58 years for males and females, y further rapid increase in life expectancy conditional upon some significant and rp improvements in health infrastructure health conditions of the people, as also se in nutritional standards, which do not m to be taking place. This is particularly of the rural areas where the health infrahas been weak and probably getti... r year by year. Besides, higher fertiln rural areas as compared to urban areas given rise to a higher percentage of child ulation in rural areas than in urban areas also higher infant and child mortality rates. n indicators of some acute forms of social bility like infant mortality (number of hs under one year of age related to the ual number of live births), under-five tality (number of deaths related to the ulation in the same age group), maternal tality (maternal deaths related to the ber of live births) and morbidity (the innce of sickness and ill health), the picture rally seems a mixed one. While the des in the infant mortality and under-five early childhood mortality have continued even during the 1980s, the progress achieved in maternal mortality and such other health conditions of women remains subdued. The fall in the infant mortality rate (infant deaths per 1000 of live births) from 110 in 1981 to 97 in 1985, to 91 in 1989, to 80 in 1990 and to 79 in 1992 is indeed noteworthy. The life expectancy at birth (the average number of years expected to be lived at the time of birth given the current mortality trends) for females remained, unlike in the developed countries, lower than that for males up to the 1971 Census but thereafter the position has been gradually reversed. Even so, it is known how unlike in the developed countries where male death rates exceed female death rates, in India death rates of children as well as women in the reproductive period exceed those for males in corresponding age groups [see Gopalan 1985; FRCH 1987]. In this regard, the SRS data for 1988 (Table A) suggest that up to the age group 30-34 years, age-specific female death rates invariably exceed male death rates but in the subsequent age groups it was the other way about suggesting that women face increased risks to life both during their infancy[9] and in the reproductive age group due to societal bias against female children and deaths associated with maternal causes [Karkal 1993; Gopalan 1985; and FRCH 1987].

Data on maternal mortality in India are indeed scanty and uncertain; levels as high as 1,300 per 100,000 live births have been quoted for certain rural areas [Sharma and Rao 1992]. Gopalan (1985) quoted a UNICEF source to suggest that during the period 1970-1972 the maternal mortality in the country ranged from 376 to 418 per 100,000 live births. The World Bank's *World Development Reports, 1990 and 1992* have reported the maternal mortality rate for India for 1980 at 500 (ibid, p 240), though a subsequent issue of this publication has not quoted any number in this regard On the other hand, the latest *Human Development Report, 1993* [UNDP 1993] has placed the maternal mortality for India at 550 for 1988. The National Health Policy (1993) under the Health For All by 2000 AD programme aims at reducing the maternal mortality rate to 200 by the 2000 AD. A study reported that for every maternal death, there were 16.5 cases of maternal morbidity or illness due to pregnancy, childbirth and puerperium [Karkal 1993]. As reported by Sharma and Rao (1992), a sizeable proportion of the maternal deaths is associated with malnutrition, particularly anaemia, but the major causes are associated with inadequate health care available to women during ante-natal, intranatal, and post-natal periods.

As a result, the female to male sex ratio has receded from decade to decade even after independence from 946 females per thousand males in 1951 to 929 in 1991. Similar to the phenomenon noticed in developed countries, 11 out of 14 districts in Kerala experience the sex ratio in favour of the females but there are also other districts in the country (e g, Srikakulam in Andhra Pradesh, Satara in Maharashtra and Pudukkottai in Tamil Nadu as per the 1991 Census), but the sociological factors involved are varied and complex. The persistent fall in the sex ratio has been noticed essentially in rural India (from 965 in 1961 to 941 in 1991) whereas in urban areas the sex-ratio has improved after the 1960s (from 845 to 893). This has occurred despite the growing incidence of male migration (probably more than female migration) from rural to urban areas; it is attributable to the persistence of risks associated with female health, particularly in rural areas.

The health infrastructure is also unduly low in rural areas as compared with that in urban areas. While the Government of India's quarterly *Rural Health Statistics* (September 1990 and December 1991) claims fairly good coverage of the rural population by sub-centres, primary health centres (PHCs), and community health centres (CHCs) under the Health For All by 2000 AD, the Planning Commission and the Department of Programme Implementation have reported poor performance in these crucial areas [Planning Commission 1993]. Kavita Bhatia (1993) and N H Antia (1993) lament how despite the creation of rural health infrastructure in a decentralised pattern based on a sound strategy, the objectives of setting up the primary health centres (PHCs) have hardly been fulfilled [Antia and Bhatia 1993: 65-66]. Now, even the Planning Commission (1992) has given up the hope of achieving any of the goals of rural health infrastructure: "The backlog of sub-centres, PHCs and CHCs in many states is staggering and the resources required to meet the targets are astronomical and as such unachievable in the near future" (p 323). Subsequently, the targets have been considerably diluted [see Planning Commission 1994].

Simultaneously, the daily calorie supply and in particular the daily protein supply per capita have also registered a distinct decline during the 1980s and thereafter. Against this background, doubts are expressed about the feasibility of achieving the goals of the child survival and safe motherhood scheme, launched by the government in 1992-93, namely, reduction of the infant mortality to less than 60 per thousand live births, child mortality rate to less than 10 per thousand children population and maternal mortality rate to less than 200 per 100,000 live births by 2000 AD. Doubts have also been expressed by demographers on the projections made by Vasant Gowarikar (1993) that India's annual exponential population growth should decline sharply from the present 2.14 per cent to 1.42 per cent by the turn of the century and "with the death rate of 8 per thousand, birth rate of 21, and the natural increase of 13 per thousand, India will reach the threshold of net reproduction rate of one within a decade" [Ashish Bose 1993].

EDUCATIONAL ATTAINMENTS

The disparity in social standards as between males and females is more glaring in their educational status. Though the disparity has narrowed over the years, the gap still remains wide. The average literacy rate (percentage of literate persons in total population) in 1991 has reached 52.2 per cent with the female literacy rate working out to 39.3 per cent and male literacy to 64.1 per cent; the

male-female differential was 25 percentage points in 1961, 24 percentage points in 1971 and again 24 8 percentage points in 1991, thus hardly showing any narrowing of the differences up to 1991

The 1991 Census has made a significant departure by canvassing the question on literacy only for the population aged seven years and above unlike the practice till 1981 of canvassing the question for those aged five years and above Also, the 1991 Census does not include the excluded younger population in the denominator for working out the percentage literacy rate unlike in the previous Census Though comparable data have been generated for the 1981 Census period also, the Census data till then remain non-comparable with the subsequent data The NSS data available up to 1987-88 as presented in Table 1 show a similar low literacy base of the Indian population and significantly lower ratio for the females than for males

The National Policy on Education (1986) had envisaged the provision of universal elementary education for children up to 14 years of age and eradication of illiteracy in the 15-35 age group But, according to the 1991 decennial Census, India had 47 89 per cent illiteracy rate and 324 million people in the age group seven plus were illiterate, though recent reports have indicated substantial progress in some states or in some districts of a few states achieved through total literacy campaigns launched under the National Literacy Mission [Mishra 1993, see also Sengupta 1991], the gap remains wide Planning Commission (1994) has reported that about 333 21 lakh persons would be covered under all schemes of adult education during 1993-94

Though gross enrolment ratio (enrolment as percentage of total population in the age group) is fairly high at the primary level, the drop-out rates continued to remain as high as 46 per cent for boys and 50 per cent for girls in 1989-90, at the middle level the drop-out rates have been 70 per cent and 60 per cent, respectively There are significant inter-state and inter-district differences in this regard As pointed out by J S Rajput (1994), cultural, historical and social constraints matter in females education, apart from early marriage, lack of upper primary schools in nearby areas also inhibits the education of girls in particular A UNICEF report brings out how the primary school drop-out, particularly amongst girls, was high and the secondary level drop-out was much higher in villages when the incidence of child labour was high [Sengupta 1993].

The Indicators

In regard to the trends in work participation rates (that is, total workers consisting of both main and marginal workers as percentage of total population) and labour force participation rates (i e, age specific labour force based on the usual status in proportion to the population aged five years and over), broad judgments pronounced by scholars on the trends in participation rates differ While Visaria and Minhas (1991) opine that "NSS surveys clearly indicate a reasonable stability in the national labour force participation rates", the Census Commissioner has noted that the total work participation rate has shown an increasing trend from 1971 onwards and that the female participation in work has shown a definite rising trend, particularly in rural areas (Census of India, 1991, Paper 3 of 1991) In this respect however, the NSS data for the 45th Round (1989-90), 46th Round (1990 91) and 47th Round (July-December 1991) show a different picture and appear as aberrations as these surveys have been based on thin sample sizes and also enterprise oriented sample designs (*Sarvekshana* 1992 and CSO, 1992 op cit)

A major issue in work participation rates concerns relatively low level of participation by women Recognising that there may be a deliberate exclusion of a whole range of activities performed by women from the purview of work and that there are cognitive problems in the identification of women workers arising out of traditional cultural biases the 1991 Census of India took special steps to "sensitise the enumerators as well as the respondents in an effort to remove the gender bias in enumeration" (Census of India, 1991, Paper-3 of 1991) To what extent this has been reflected in data for 1991 is indeed difficult to discern, particularly because the increase in work participation rate for rural women during 1981 1991 (4 14 percentage points from 23 06 per cent to 27 20 per cent) was not any the higher than that between 1971 and 1981 even after making allowance for conceptual differences (7 14 percentage points from 15 92 per cent to 23 06 per cent)

The unemployment rates as provided by the NSS data indicate no definitive trend While the most inclusive concept of unemployment measured in terms of person-days, shows a significant decline in 1987-88 in almost all categories after showing some increase between 1972-73 and 1983 (amongst males in particular), what is said to be chronic unemployment rate measured by the usual status approach did show a gentle increase between 1972-73 and 1987-88, so also generally as per the mid-way measure of person-week or weekly status [10]

As for the trends in poverty rates, data now put out by an Expert Group of the Planning Commission placed the proportion of people below the poverty line at 38 0 per cent (or about 302 million people) in 1987-88 [11]

Comparison with Other Countries

That even among the populations of developing countries the Indian population enjoys a conspicuously low social development was evident from the low rank of 134 assigned to the country in an array of 173 countries arranged in descending order of the Human Development Index constructed by the UNDP s fourth *Human Development Report 1993*

As may be seen in Table 2 India's adult literacy rate (per cent of literate persons aged 15 and over) at 48 2 for 1990 compares with South Korea s 96 3, Thailand's 93, Indonesia s 81 6 Malaysia's 78 4 and China s 73 3 As early as in the mid-1970s, these countries had adult literacy rates ranging from 60 for Malaysia to 92 for South Korea when India s was only 36 (Table 3) Similarly in infant mortality rate (deaths of infants under one year per 1 000 live births), India has as high a rate as 90 for 1991 compared with 16 for South Korea, 15 for Malaysia 27 for Thailand and 74 for Indonesia and 38 for China (Table 6) Again, maternal mortality rate (deaths of women from pregnancy-related causes per 100 000 live births) estimated at 550 was the highest for India as against a range of 50 to 300 in respect of the above five countries Though India has achieved a life expectancy at birth of over 59 years it is still much lower than that in other comparable countries It is the gender bias against women in India that stands out Women literacy rate is strikingly low While school enrolment has reached a sizeable number at the primary level it continues to be low at the secondary level More significant is the sizeable drop out rate for female pupils While a detailed review of these inter-country differences is beyond the scope of this note, there is enough evidence in the social indicators presented in Tables 2 to 6 to show how India lags behind these countries in overall social development

Interestingly a comparison of the rankings based on different parameters suggests that India s ranking based on HDI is better than that based on GNP per capita fairly significantly though even here China scores over all other developing countries including India (Table 2) An important factor in India lagging behind other countries in social development has been the considerably low level of government expenditure earmarked for health and education sectors as compared with that in other countries (Table 6)

Notes

1 For a description of the myriad sources of social and economic data see Government of India *Report of the Committee to Review the National Statistical System* (Department of Statistics Ministry of Planning June, 1980)

Table A Estimated Age Specific Death Rates by Rural/Urban and by Sex India 1988
(Number of deaths per 1000 of population in the age group)

Sector	0-4 Years			5-14 Years			15 34 Years			35 49 Years			50 Years and Above

Source Registrar General, India, *Sample Registration System—1988* May 1991, pp 47-54

India has been singled out as one of the "five countries that have readily available data to undertake" group-specific and region-specific human development measures, in the company of the US, Mexico, Turkey and Swaziland. See UNDP, *Human Development Report, 1993*, p 18.

For a detailed description of the varied statistical series published by the CSO, see Government of India, *Annual Report, 1991-92 and 1992-93* and Government of India, *Performance Budget, 1993-94* (both of Department of Statistics, Ministry of Planning and Programme Implementation).

Apart from the massive amount of data on various population characteristics, economic and industrial classification of population/workers, fertility rates, social and cultural characteristics, housing and household amenities and special data on ex-servicemen (some based on Census and full count and some on a sample basis) generated in the decadal Census, the Sample Registration System (SRS) operated by the Office of the Registrar General, India, since 1969-70 has become a regular source of annual estimates on vital statistics, particularly in the absence of dependable data from the civil registration system in India. The SRS provides crude birth and death rates at the state and national levels for rural and urban areas separately and also estimates on various other measures of fertility and mortality. The SRS, which became operational 25 years ago in 1969-70, is an annual survey conducted at present in 6,022 sample units (approximately 0.7 per cent of the country's population) in urban and rural areas spread all over India except Mizoram, the sample units being villages and Census enumeration blocks (urban). The SRS is a dual registration system involving enumeration of all births and deaths in a sample unit through two different procedures, viz, continuous enumeration and retrospective but independent half-yearly survey followed by a process of matching the two records. This dual registration system has been the basis of annual birth rate, death rate and rate of natural increase, as also other fertility and mortality indicators during the past two decades and a half. See various issues of *Sample Registration Bulletin* (up to January 1994) and Registrar General, India, *Sample Registration System 1988* (New Delhi, May 1991). See also Swamy and Sinha in *SR Bulletin*, January 1994. For details of the large-scale integrated sample surveys in socio-economic fields conducted by the NSSO, see Government of India (1993) and various issues of *Sarvekshana*.

The CSO had brought out an exploratory issue of *Selected Socio-Economic Indicators for India* in December 1987 but the regular series began in 1989.

The question of conceptual differences regarding rural-urban differentiation is relevant only up to the 1971 Census after which, "for purposes of comparability and administrative convenience, the definition of an urban unit was uniformly adopted. See *Census of India, 1981 : Paper-2 of 1981: Rural-Urban Distribution*. On the question of worker participation differences, see *Census of India, 1981 : Paper-2 of 1982: Development of the Economic Questions* and also Hirway (1993). On the question of literacy, see *Census of India, 1991: Paper-1 of 1991, Provisional Population Totals*.

On the other hand, it must be said to the credit of population experts that for medium-term projections they can come to a reasonable estimate of the population size based on vital statistics derived from the Sample Registration System. The Report of the Standing Committee of Experts on Population Projections (October 1989) had placed the country's total population at 843.6 million for March 1, 1991 while the subsequent Census 1991 placed it at 846.3 million for the same period. The long-term projections have, however, been far wide of the mark because some of the hopes of successes in reducing birth rates, or achieving better couple protection rates, have generally been belied. Incidentally, there are three sets of annual series of population normally put out in official publications : (i) for March 1 each year extending the decennial census data provided by the aforesaid standing committee; (ii) mid-calendar year population estimates by the Registrar General as published in the Government of India's *Economic Survey*; and (iii) mid-financial year estimates provided by the CSO in its *National Accounts Statistics*. The three sets of estimates for recent years are as follows (in million):

Year	March1	Mid-Calendar Year	Mid-Financial Year
1991	846.3	851.7	856.0 (1991-92)
1992	862.5	867.8	873.0 (1992-93)
1993	878.6	883.9	

7 The relevant data on estimated crude death rates by sex and by rural and urban India from the 1988 SRS are:

Sector	Number of Deaths per 1000 of Respective Population		
	Male	Female	All Sexes
Rural	11.9	12.0	12 0
Urban	7.9	7.4	7.7
All-India	11.0	11.0	11.0

See Registrar General (1991), pp 36-37.

8 The officials associated with the estimates in the Registrar General's Office have argued that the SRS estimates for rural areas of MP and UP are sufficiently reliable. See Swamy and Sinha in *Sample Registration Bulletin*, January 1994.

9 Significantly, the World Bank (1993) has reported that "under good nutritional and health conditions and in times of peace, male children under five have a higher death rate than females" (p 322). Besides, it is widely recognised how "women face health problems throughout their life-cycle, starting from sex preferences in infancy, discrimination in feeding practices, biological vulnerability during the reproductive period, the effects of repeated pregnancies, to special problems such as nutritional anaemia and maternal mortality" [FRCH 1987: 145].

10 For a comparison of the concept of 'work' adopted by the Census and NSS surveys, see *Census of India, 1991 : Paper-3 of 1991* and also Visaria and Minhas (1991). For details of the three concepts employed by the NSSO, see CSO (1992) and Visaria and Minhas (1991). These concepts were evolved on the recommendations of the Committee of Experts on Unemployment Estimates set up by the Planning Commission in 1969 (Chairperson, M L Dantwala).

11 For details, see *EPW* Research Foundation, 'Poverty Levels in India : Norms, Estimates and Trends', *Economic and Political Weekly*, September 18, 1993.

Printed by Krishna Raj at Modern Arts and Industries, 151, A-Z Industrial Estate, Ganpatrao Kadam Marg, Lower Parel, Bombay 400 013 and published by him for Sameeksha Trust from Hitkari House, 284, Shahid Bhagatsingh Road, Bombay-400 038

Three generations of small savers. There's one thing they all trust–Units.

Even people generations apart think the same way when it comes to Units. Because Units help make their dreams come true.

Whether it's a young man saving for a house of his own. Or an older man looking forward to a comfortable retirement. Or a little girl dreaming of becoming a doctor some day..

Unit Trust has schemes to meet every need. Whether the need is for high growth or liquidity. Whether it's tax benefits or good returns coupled with insurance cover.

People know that with Unit Trust, they can get what they want. That is why the number of Unit holders is going up so spectacularly. To over 33 million today. Most of these people are small savers. They come from every part of the country. They come from every walk of life. They have different needs, different dreams.

But they share the same abiding confidence in Unit Trust. Living up to this confidence is what keeps us going. And growing.

UNIT TRUST OF INDIA
For your better tomorrow.

Public Issue of 90,00,000 Equity Shares of Rs. 10/- each for cash at par aggregating Rs. 9,00,00,000.

HIGHLIGHTS ■ Promoters contribution includes M/s Asian Finance and Investment Corporation Limited (AFIC) which has been promoted by Asian Development Bank (ADB) ■ Technical knowhow from M/s Tata Korf Engineering Services Limited covering guarantees for production ■ Technocrat Promoters ■ Project appraised by ICICI and with financial assistance from ICICI IDBI and IFCI ■ Project ideally located as it is in close proximity to raw material sources and consumption centres ■ Captive power plant ■ Commercial production by July 1994 ■ Easy liquidity listing proposed at Hyderabad Bombay and Calcutta Stock Exchanges ■ Income tax benefits under section 80M 80L of the Income Tax Act

Investors may note that in case of oversubscription the allotment shall be on a proportionate basis, a SEBI nominated public representative shall be associated in the process of finalisation of basis of allotment

RISK FACTORS ■ INTERNAL 1 The Company is yet to receive the environmental clearance from the concerned authorities ■ EXTERNAL 1 The cost of one basic input coke which is to be imported is exposed to exchange fluctuations which could affect the profitability projections 2 The possibility of competition from the existing companies and the new projects which would manufacture Pig Iron is not ruled out 3 Performance of the user industry will have a bearing on the performance of the Company 4 Any time overrun in the implementation of the project or longer period of stabilisation of production may affect the financial projections of the Company

Rs.5/- on Application

MANAGEMENT PERCEPTION OF THE RISK FACTORS ■ EXTERNAL 1 There would be a corresponding increase in the price of pig iron for any increase in the price of imported coke these fluctuations may not affect the overall profitability 4 The project would be implemented by July 1994 as against October 1994 as envisaged by the [illegible]

Matriliny and Islam

History provides instances of societies that come to accept two sets of rules simultaneously, both being viewed as sacrosanct: those subsumed in traditional customary law and derived essentially from kinship and those subsumed in the legal codes of their new faiths. The people of Lakshadweep, who have followed matriliny under the rubric of Islam, present a fascinating case of this kind. **1273**

Non-Agricultural Employment

While the near-constancy of the occupational structure in India has been a major cause for concern, Kerala has drawn considerable attention for its apparently 'developed' occupational pattern characterised as it is by a relatively low share of agriculture. A review of the structure of rural employment in Kerala, particularly non-agricultural employment, focusing on the weaknesses of the emerging structure. **1285**

Fiscal Deficit

Since the fiscal deficit has now started to be used extensively to measure the success or otherwise of the government's macro-economic operations, we have to be clear about what to include or exclude in its calculation. **1297**

Education for Whom?

In the existing socio-political and economic matrix, for whom is education and whose quality of life does it improve? **1257**

Torture

Despite repeated exposure by journalists and human rights organisations and occasional intervention by courts, torture is pervasive and a daily routine in every one of India's states, irrespective of the political persuasions of the party in power. **1259**

Unintended Victims

Taking the totality of violence around us, we see that most acts of aggression are ultimately expressions of redirected anger—anger that brings violence to people for whom the aggression is not specifically intended. **1267**

Job Destruction

Unemployment in the leading capitalist countries has now hit levels unprecedented since the Great Depression, with the so-called cyclical upswings making little difference. Also it seems to matter little whether the hegemonic political force in power is social democrat, monetarist or Keynesian. **1265**

Posturing

While supporting the recent Tilhari judgment, left and feminist groups should take care to expose the pseudo-champions of Muslim women's rights who remain silent about the plight of Hindu women. **1264**

Uneven Development

Apart from India's generally low level of social development, the inter-regional and inter-state disparities in such development are acute. Special statistics on social indicators of development for states and regions. **1300**

Double Demise

With the collapse of the erstwhile communist regimes in eastern Europe, socialism has suffered a severe setback. But we also need to reflect on another development: the death of market capitalism. **1253**

Why Scientism Beats a Retreat

DHRUVA RAINA (October 16, 1993) raises some important issues about the legitimacy of science, methods of science and what has belied hopes about science. When discussing the legitimacy of science, we have to distinguish between its contents and its applications. The former consists of experimentally verified facts, and theories, laws and hypotheses which may be looked upon as abstractions or abbreviations from which experimentally verifiable facts can be deduced. All this is knowledge and it is neither good nor bad. Of course, science is reaching a stage when experiments and gains in knowledge in isolated fields like bio-technology may be hazardous—but it looks as though with controlled experiments even this can be avoided.

When one comes to applications of science, the human element comes in and the question is whether to blame the human element or science for the distortions. The ozone hole is due to automobiles, refrigerators and a host of other developments made possible due to science. But creating the ozone hole is certainly not necessary for the pursuit of science. The ozone hole is the creation of the irrational craving of the human mind for things that are not functionally needed for leading a civilised life. Instead of using science to shape his life, man is using the craving of his mind to do so and in the process has created ecological disaster. It is science that has brought home to man that his methods are threatening his very survival and science cannot be blamed for doing this service.

A distinction has to be made between science content and scientific method. Knowledge of science for day to day needs and healthy living is a must. Unfortunately this is lacking due to science illiteracy as pointed out by the author. What is much more precious is a knowledge of scientific method which is as important as literacy. Briefly, the scientific method is (1) What is experimentally verified is fact. (The experiment being repeatable by another person.) (2) When there are two different opinions, the only way we can decide as to which of them is correct is by experiment, if an experiment is possible. (3) What cannot be experimentally verified can only be an opinion as every statement has its counter. (4) The onus of proving a fact rests on the claimant. (5) Facts have generality (circulation of blood is the same for all human beings). (6) Theory, law, hypothesis are statements from which experimentally verifiable statements can be deduced.

The author has rightly pointed out that scientific truths are provisional truths and not absolute or universal truths. Not only theories, laws, hypotheses change but also experimental facts (but this has not hindered the growth of science). By adopting provisional truth as a working hypothesis and correcting it by trial and error method as new facts are discovered, science has made unimaginable progress compared to other disciplines.

Compared to science, the performance of disciplines which do not even have a method of deciding which of two opinions is correct is dismal. In these disciplines opinions abound without any accord. Further since experimental facts are repeatable, prediction (an aeroplane can be designed to fly) is possible in science which is one of the main reasons for its utility. This is lacking in other disciplines.

Scientific method is the treasure-trove of humanity and all that man has to do is to 'learn' to use science to solve all 'problems'. Science has made available the way and what is required is the will.

Workers Let Down

IN response to the report 'New Hurdles' (January 15), I strongly condemn the lukewarm behaviour of CPI(M) leaders and CITU in settling the problem of the Kanoria Jute Mill workers. It is disheartening to note that the trade unions are supporting the management and the labour department in deserting 14,000 workers of the Kanoria Jute Mill. It is clear from the report that all the established trade unions in West Bengal have become self centred and they are of no use to the workers. When the CITU cannot support the Kanoria workers in fulfilling their genuine demands it cannot be called communist anymore. At least when the SSU was formed CITU should have helped it. Whatever may be the situation, when a problem arises for the working community all should get united and work for its solution. Otherwise there is no difference between capitalists and workers in a capitalistic society.

Caste and Justice

KANCHA ILAIAH (March 19) has presented a logical political analysis but seems to have ignored the fact that the backlash of caste as ideology is bound to disintegrate as soon as it proves a threat to other castes.

It is evident that the BSP might emerge as a pressure group but cannot ensure social justice to the weakest among the weaker sections of our society. In a caste-dominated society intrinsic sub-caste conflicts and corrupt political and administrative infrastructure are sufficient to spoil the game engineered by Kanshi Ram. The moment the present affluent class of dalits and OBC feel a threat from the politics of BSP, powerful forces would emerge to curb its growing influence. We have seen examples of the Janata Dal and its leader V P Singh who championed Mandal Commission report—Mandal heroes have been reduced to zeroes.

Another interesting example to show some future trends likely to emerge are recent riots in Meerut over the installation of the Ambedkar statue. In this game except a small group of dalits all other backward SC/ST castes kept themselves aloof. Even the SP-BSP coalition government in UP could not come to their rescue.

Cosmetic Gestures

THE Reserve Bank of India's monetary and credit policy for the first half of 1994-95 and the broad monetary target for the full year are grounded in the narrowest possible construct of money-real economy linkages. It is difficult to explain otherwise the RBI governor's very exact prediction of a reduction in the inflation rate by four percentage points during 1994-95 because broad money (M3) growth would be contained within a range of 14-15 per cent during the year. Recent experience has shown that the RBI has little control over money supply growth, much less over inflation. Conventional relationships have broken down and, because of the extreme slackness in the real economy, there has emerged a complex disequilibrium between monetary and other financial sectors and between them and the real sectors. There is no appreciation of these complexities in the RBI's assessment and, therefore, what it has presented as a policy has hardly any relevance to the actual situation obtaining in the economy. No doubt in the current depressing economic [illegible] the monetary authorities are having to bear the brunt of fiscal policy failures, but the RBI has contributed to the fiscal failures and has been more loyal than the king in regard to structural adjustment in general and financial sector reform in particular.

What are the key elements of the economic situation which ought to have influenced monetary policy formulation? First, there is the general slackness in economic activity and, in particular, the industrial recession stretching to some four years already. Neither the whopping revenue and fiscal deficit nor the massive liquidity growth has helped because both have been unrelated to productive activity in the real sectors. The former has been absorbed in the government's non-productive expenditures and the latter has served to bloat financial, particularly share market, asset values and real estate prices in urban areas. Second, against the backdrop of economic sluggishness the premature imposition of capital adequacy and other norms on the banking system has adversely affected both the demand for, and supply of, bank credit for productive activities. Non-food credit by scheduled commercial banks increased by Rs 7,476 crore (5.1 per cent) in 1993-94 compared to Rs 24,317 crore (20.1 per cent) in 1992-93. The RBI governor has nonchalantly attributed this to banks' hesitancy in providing credit because of "credit risks in the context of the prudential norms".

Third, the large increases in liquidity since the beginning of 1993-94 are attributable, despite the RBI's attempt to duck the issue, as much to the central government's compulsion to borrow for financing unproductive expenditure as to the large foreign exchange accruals. Dealing with the causes of monetary expansion in 1993-94, the RBI governor makes much of the so-called historic step of the government agreeing to the enforcement of a cap on the automatic monetisation of the centre's fiscal deficit through the creation of *ad hoc* treasury bills and the success of an active internal debt management policy with the government raising money at market related rates of interest through a system of auctions. These claims fly in the face of facts. The rapid increase in foreign exchange [illegible] essentially occurred in the second half of 1993-94, whereas in the first half of the year there had been an increase of Rs 4,104 crore in the net foreign exchange assets of the banking system, in the second half the increase was Rs 21,870 crore and in the first three weeks of April there has been a further addition of Rs 1,788 crore. When liquidity was not abundantly available with the banking system in the first half, the central government borrowed as much as Rs 12,117 crore from the RBI though for the whole of the year the 1993-94 budget had placed the budget deficit (or net RBI credit) at only Rs 4,314 crore. In the second half and thereafter, with abundant liquidity in the market, RBI credit to the central government was reduced and government borrowed from the commercial banks. This was done with ease because banks were themselves reluctant to extend commercial credit due to the capital adequacy norms. In the second half, the central government curtailed its dependence on the RBI by Rs 10,783 crore, but commercial and co-operative bank credit to government increased by Rs 18,364 crore, there has been a further increase of Rs 6,240 crore in the first fortnight of April. Did the RBI and the government have any choice but to absorb the liquidity through a contraction in RBI credit to the government? When the RBI governor claims to have successfully operated an active internal debt management policy, is it the contention that when the RBI injected some Rs 24,000 crore through purchase of foreign exchange in the second half of 1993-94 and thereafter, there was an option of pumping in another Rs 10,000 crore through RBI credit to the central government? Initially, in the 1993-94 budget, the government had visualised total borrowing of only Rs 9,700 crore from the market, but it ended up borrowing as much as Rs 29,692 crore (revised estimates)—all because tax revenues were surrendered and all for financing a revenue deficit of Rs 34,058 crore. Whatever happened to government borrowings crowding out private sector needs?

Against this background and the fact that since the beginning of 1993-94, in a period of 13 1/2 months up to April 15 this year, M3 has expanded by as much as Rs 82,005 crore, Rs 20,174 crore of it in the form of currency with the public, the measures announced this week, principally the raising of the cash reserve ratio (CRR) from 14 per cent to 15 per cent to absorb an amount of Rs 3,700 crore and the downward revision of the export refinance limit by about Rs 1,570 crore (when the actual utilisation ratio is just about 10 per cent due to excess liquidity with banks), are hardly relevant. The emphasis both in these measures

as also in the stiffening of the selective credit controls against sensitive commodities is on inflation control through conventional demand management policies

The macro economic situation however calls for effective implementation of broadbased supply management policies but going far beyond the narrow fire fighting concept of supply management proposed by the authorities through import of a few commodities in short supply Broadbased supply management would aim at a step up of investment and saving which alone will help utilise both foreign exchange reserves and liquidity for productive purposes To achieve this, the government and the RBI will have to take a series of well thought out steps a sizeable increase in public sector investment which will go to crowd in private investment, compelling companies to use funds obtained from abroad for investment and production rather than in the stock and financial markets and in real estate and inducing banks to extend commercial credit even if this requires postponing the implementation of capital adequacy norms A pick up of the tempo of activity in agriculture and rural and small scale industries has immense potential for generating demand for the goods of medium and large scale industries, both directly and indirectly by augmenting household incomes and consumer demand for industrial goods

The monetary policy changes announced by the RBI show no awareness of the need for such purposeful supply management The RBI has instead consistently narrowed the scope of banks priority sector advances In the latest policy the definition of the priority sector has been expanded to cover (i) scheduled commercial banks lendings to their sponsored RRBs (ii) advances up to Rs 5 lakh for financing distribution of inputs for agriculture allied activities such as dairying poultry piggery and fisheries and (iii) the enhanced credit limit of Rs 5 lakh granted to professionals and self employed persons and of Rs 10 lakh for qualified medical practitioners in rural and semi urban areas including for purchase of one motor vehicle These changes have been introduced surreptitiously in the sense that no revision has been effected in the overall priority sector ceiling of 40 per cent or the sub ceiling of 18 per cent for agriculture Earlier indirect credit given to agriculture was included in priority sector credit similarly, the definition of small scale industry was expanded to cover units with capital investment of Rs 75 lakh against the erstwhile Rs 35 lakh—once again without changing the overall ratios With such definitional changes which would automatically enable banks to fulfil the priority sector norms without involving themselves in additional lending the RBI s bureaucratic proposal that the banks prepare action plans for monitoring their sub target for agricultural lending during 1994 95 is an eye wash Similarly while the RBI s increased assistance to the National Bank for Agriculture and Rural Development (NABARD) for providing refinance support to primary lending institutions is indeed helpful the more serious question is that relating to the institutional structure for rural lending which is in disarray Except in very few areas credit co operatives are weak the regional rural banks (RRBs) are in the red and commercial banks are withdrawing from rural lending In this situation one should not be surprised if private moneylenders and moneylending organisations are eventually accepted by the government as the ultimate answer to the problem of rural finance putting the clock of progress back by many decades

KARNATAKA

Panchayat Election Fiasco

THE Karnataka government s decision to postpone the second round of panchayat elections beyond June is a clear case of flouting the Constitution and distorting the Supreme Court ruling with impunity while keeping just within the plane of legality That there have not so far been attempts by opposition parties to mobilise large scale mass based protest about this blatant disregard of democratic practice is a sad commentary on current political ethos

On April 30 less than two weeks after the state election commission had announced the new dates for the postponed elections to the zilla parishad and the taluka panchayats the state governor promulgated an ordinance amending sections of the Karnataka Panchayat Raj Act relating to reservation for backward classes Following this the state government promptly constituted a one man commission to work on delimitation of constituencies and postponed the elections much to the dismay of the governor The state government s argument is that according to the older reservation policy the state act provided for 33 per cent reservation for backward classes The new policy adopted by the government recently extends the reserved quota to 50 per cent

The sequence of events and the resignation of the panchayat raj minister M Y Ghorpade—for failing to keep his promise of holding the panchayat elections before the end of May—tell a different tale The new policy based on the recommendations of the Chinnappa Reddy Commission was adopted by the government two days after the dates of the panchayat elections were announced Following this Ghorpade clarified that although the gram panchayat elections had been conducted on the basis of the 1986 policy of reservation the current round would be according to the new policy which he said extended the reservations He implied that the Panchayat Raj Act stipulated that reservations should be according to the 1986 policy or any order which might replace it The changed policy now compartmentalised four categories most backward classes, more backward classes backward classes and occupational groups with 75 per cent of the reservations going to categories one, two and four and 25 per cent to category three Ghorpade held that postponement of elections was not necessary for recategorising the reserved seats Moreover the state election commission had pointed out earlier that unless elections were held before June they would have to be postponed until next year because of the monsoons the assembly elections in November followed by the formation of the new government etc The Moily government s insistence on postponing the elections is obviously motivated by different considerations

For one thing not so very long ago, Veerappa Moily in order to quell the dissidence within the party had to constitute a jumbo cabinet in an attempt to accommodate the various power groups Even so the Congress in Karnataka is beset with problems, some internal and others caused by the fact that Moily has been unable to keep the promise of effective leave alone efficient and corruption free government Moily embarked on a tour of the state to campaign for the panchayat elections after the dates were announced and it is significant that the postponement came soon after this In fact the announcement of the new reservation policy only narrowly escaped violating the code of conduct laid down by the election commission because the election notification had not been issued although it was clearly a pre election ploy to capture votes But that this was not sufficient must have been obvious to Moily

The lack of mass mobilisation on the issue is indeed a cause for dismay Clearly the long years of an institutionalised democratic system has meant that it is possible for those in power to distort democratic principles even while sticking to the legal requirements These distortions cannot be opposed by recourse to the courts alone A further proof of the need for such a movement lies in the fact that the Karnataka government has neglected to constitute a finance commission to take care of the finances of the local government thus violating the requirements of the State Panchayat Raj Act Without such a commission in place *ad hoc* financial arrangements are being adopted which will make a mockery of effectualising local government Thus if the 73rd constitutional amendment is to really lead to the empowerment of local governments and not in fact to an apparent demonstration of the inability of people to handle the affairs of government at the local level there has to be more than formal criticism and protest

INDIAN WORKERS IN WEST ASIA

Paying with Their Lives

AN extremely disturbing aspect of the Indian emigration to the Gulf has for long been that living and working conditions of our emigrant workers in that region are to say the least extremely difficult How hazardous these conditions are stares one in the face when one reads the *suo motu* statement in parliament by R L Bhatia minister of state for external affairs, on the evacuation of Indian citizens from war torn Yemen Hopefully belated though the government action has been in this regard, it will be possible to evacuate all of our citizens exposed to risk of life in either part of Yemen

But the hazards to our emigrants to the Gulf arise *not* so much out of the sort of conflict that has cropped up now in Yemen or that arose between Kuwait and Iraq four years back The continuing hazards our emigrants face arise from their living and working conditions and this comes out from the figures the minister gave in the course of his statement to parliament about the deaths of our emigrants and their causes

According to Bhatia, out of a total of 1 583 bodies or mortal remains shipped back from west Asia during 1993 and up to April 1994 (i e in some 16 months) only 982 deaths were due to natural causes the balance were due to accidents (506) suicides (83) murders (9) and executions (3) Thus close to 40 per cent of the deaths of our emigrants in west Asia were due to unnatural causes chief of them being accidents The minister did say that Indian missions in the region do try to obtain compensation and early settlement of legal dues however complicated the formalities and even gave a figure of the amount repatriated as compensation in 1993 namely, Rs 8 47 crore i e Rs 1 5 lakh per death on average a rather small amount remembering what expenses an emigrant incurs and what his death means to his family in purely financial terms

The fact remains that deaths from causes other than natural are far too high to be slurred over It is not clear whether or not members of parliament reacted strongly to the disclosures but it is not a matter they can allow to rest Several questions arise How many of the accidents were work related? What was the nature of non work related accident deaths? How do the figures for Indian emigrants compare with those for emigrants to west Asia from other countries say, Pakistan and the Philippines? Is not the suicide rate among Indian emigrants rather high? Are not these suicides mostly job related?

Bhatia s statement does not give the impression that the government is fully aware of the enormity of the situation Nor is the effort of our missions in the region, as reflected in the figure of compensation amount obtained sufficiently reassuring The government cannot be allowed to wallow in the inflow of the large annual remittances and not attend to the lives lost in the process of earning these remittances

STOCK MARKETS

Wrong Signals

THE attitude of the authorities in regard to the goings on in the stock market can only be described as curious The finance minister has reportedly directed the Securities and Exchange Board of India (SEBI) to restart the badla system of forward transactions in some form or the other The government, it seems refuses to learn any lessons from the massive fraud in securities and banking transactions in 1991 92 on which the country has before it the report of a joint parliamentary committee (JPC) The report had found that despite repeated warnings by the governor of the Reserve Bank of India (RBI) and the chairman of SEBI the ministry of finance did not address themselves seriously to check the unhealthy trend believing this phenomenon to be a beneficial consequence of their policy

When the BSE sensitive index (base 1978 79=100) shot up from 1915 at end-December 1991 to 4 546 on April 2 1992, SEBI had warned the finance ministry of the hyper heating of the market and attributed it to the entire system of badla trading As it did not have the powers itself, SEBI had wanted the finance ministry to suspend trading in carry forward transactions Nothing was done but when the bubble finally burst the government was forced to vest SEBI with the necessary statutory powers SEBI found that brokers continued to build up large speculative holdings and persist in a variety of malpractices without the stock exchange authorities lifting a little finger Incidentally, we now have it on the authority of the former executive director of the Bombay Stock Exchange (BSE) that the Indian secondary market in securities continues to be affected adversely by malpractices like lack of transparency insider trading, manipulation of prices proliferation of odd lots, inadequate protection to clients in case of defaults by stock brokers etc '

SEBI was thus on strong ground when it banned forward trading in December last year However apart from stockbrokers and other speculators who were understandably peeved at SEBI chairman G V Ramakrishna's tough stand and his proposal for replacing badla with a system of futures and options, the government too could not stomach his independence Ramakrishna's removal from the chairmanship of SEBI was received with relief by brokers and there was a significant improvement in share prices

In the meantime, with sizeable foreign funds flowing into the stock exchanges and the exaggerated expectations aroused by the finance ministry in regard to the liberalisation process and the 1994-95 budget the BSE sensitive index again reached a high of 4299 on February 28 While the index has since ruled lower, even at its present level the P/E ratio for the 30 scrips comprising the sensitive index stands at 47

Overall the banning of 'badla' trading has introduced a measure of sobriety into share market operations Almost for the first time in the history of the BSE, the gross turnover in non specified scrips has crossed that in specified scrips, thus confirming that the bulk of the transactions in the latter were speculative The gross turnover in non-specified shares in April was Rs 2,298 crore as against Rs 1,033 crore in specified scrips In November 1993, by contrast, the gross turnover in non-specified shares was Rs 1,307 crore or just 24 per cent of that in specified scrips at Rs 5,501 crore Even in February this year—that is, before the cleaning up of the earlier speculative holdings had been completed—the gross turnover in non-specified shares remained lower at Rs 3,915 crore or 72 per cent of that in specified shares The significant diversification of the pattern of investment in shares reflected in the change in the relative turnover in specified and non-specified shares should be a boon for medium-sized companies and also portends a more healthy development of the capital market Besides, a major qualitative difference between when 'badla' transactions were prevalent and now is that about 85 per cent of the transactions then were for carrying forward deals whereas an equal proportion now result in cash delivery The emerging situation is akin to what obtains in the more advanced markets, in the US, for instance, more than 85 per cent of transactions result in cash delivery Many of the malpractices, including insider trading and kerb dealings, are also reported to have faced some restraint after the ban As brought out in the JPC report, the SEBI was convinced that the root problem of secondary share market operations was the archaic badla system which provided share brokers with tremendous clout and resources Obviously, the alternative in the form of futures and options has to await the advent of screenbased and scripless trading As an interim arrangement SEBI has proposed a system of limited carry-forward transactions with fairly stiff margin requirements and also equal treatment of bears and bulls, but the stock exchanges have refused to fall in line

Against this background when the newly created supervisory body was striving to confront the brokers as a class with a vested interest in the badla system the finance ministry has once again sent out wrong signals to the market and the community at large The failure of the Videsh Sanchar Nigam Euro issue has been erroneously attributed to the so-called depression in domestic

[illegible] the more fundamental micro economic factors. Having statutorily [illegible] created an independent SEBI, communications from the finance minister and his ministry to this body should be transparent so that there is no day to day inter[illegible]. It is to the credit of the SEBI that it [illegible] from the [illegible] securities scam. The credibility it has gained as a result needs to be nurtured not undermined.

ASLV

Commercial Viability

THE successful launch of the Augmented Satellite Launch Vehicle (ASLV) and the 115 kg satellite it carried into what is referred to as a high performance low earth orbit on May 4 has received wide notice and acclaim as having established once and for all the autonomous Indian launch capability in regard to vehicles and orbits of this class.

If one's only source of information on the subject were the budget documents, one would be wondering why so much was being made of the recent launch. According to the Expenditure Budget (1994-95) Volume II, a major milestone in the Indian space programme was achieved "with the successful launch of the third development flight of ASLV-D3 from Sriharikota on May 20, 1992. ASLV-D3 successfully injected SROSS-C satellite into orbit". If the earlier launch was successful and the one executed this time was just a repeat, why the song and dance about it? The fact is that only now has genuine success in the form of what has been described as a text book launch been achieved. The earlier launch had virtually aborted after the first two stages and its payload had been disgorged in a lower orbit. Obviously another launch had to be made to establish the capability. But the question remains: Why are our scientists so quick to claim premature success? That, however, is for the scientists to sort out among themselves.

What should be of interest to the general public is the claim now being put out that our space agency ISRO has proven not only its technical capability but also its ability to do its task at the lowest cost. Has it? It is reported that the ASLV can deliver payloads in low earth orbits at a cost of $ 17,600 per kg as against $ 50,580 per kg in a comparable launch vehicle called Scout. It is not clear how the costing has been done with respect to the ASLV's launch, but even assuming that it will launch a payload of 150 kg (the latest launch carried a payload of only 115 kg), the amount the space agency will recover at the rate of $ 17,600 per kg works out to Rs 7.90 crore as against the original sanctioned cost of the ASLV project of Rs 17.98 crore (the actual cost of the project has been probably far in excess of that). In addition, one has to take note of the cost of the satellites launched and lost, not to speak of the overheads of an organisation that will cost the exchequer Rs 755 crore in 1994-95.

The point is that while to some the establishment of the launch capability is an end in itself and worth any expense, however high, if the commercial viability of the programme is also sought to be established, a far greater amount of sophistication will be called for than is in evidence. The space agency ISRO has failed to establish its commercial credentials so far. Hopefully its new commercial arm, ANTRIX, will work out its costing properly before it starts peddling its products.

DELHI

Environmental Facade

ALTHOUGH only a few months old, the BJP government of Delhi has already somewhat fouled up its image over an apparently non-political issue by resorting to what its leaders in their evangelical zeal may regard as a reformist measure but which threatens to alienate a large number of their followers in the capital in the long run.

The controversy over the BJP government's decision to clean up the Idgah abattoir in the old city and the crisis generated by it in the meat market of the capital indicate the trap which the BJP has got itself into. On the one hand, it is bound by its obligation to adhere to the principles followed by the RSS-VHP ideologues (who strongly stress vegetarianism as a food habit) and, on the other hand, it has to take care of the traditional food habits of its north Indian Hindu voters (most of whom are non-vegetarians). Incidentally, contrary to the impression created by the BJP-RSS-VHP politicians that the majority of Indians are vegetarians, the latest survey by the Anthropological Survey of India—contained in the recently published 10 volume *People of India*—clearly shows that only about 20 per cent of the various Indian communities are vegetarians. The ASI report observes: "We are largely a drinking, smoking and meat-eating people".

The BJP government is armed by an order from the Delhi High Court which has ruled that the number of animals slaughtered at the Idgah should be reduced from the daily 12,000 to 2,500 to prevent unhygienic conditions created by the accumulation of carcasses in a crowded place which also results in the contamination of the meat. While everyone would agree that the filth in the slaughter house should be removed and that contaminated meat should be stopped from reaching the retail shops, the BJP government's decision to make this a priority item on its agenda of reforms gives rise to several suspicions. First, a large number of butchers at the Idgah abattoir are Muslims. Some years ago, during communal riots in old Delhi, they were the main targets of RSS arsonists, who set fire to the abattoir as a result of which their business suffered. The BJP government's latest move to curtail their business, backed by a court order this time, has quite understandably made the Muslim community suspicious. But they are not the only victims. A large number of Hindus—suppliers of animals to the butchers, as well as traders in the wholesale and retail market—are also affected by the government's decision, not to speak of the meat eaters among the capital's Hindu citizens who for the last one month have been going without meat (because of a strike by the butchers in protest against the official measure), and may have to spend more to buy meat when it is available, because of short supply due to the court-enforced restriction on the slaughter of animals at the abattoir.

The BJP government is defending its decision with the populist appeal of protecting meat-consumers from contaminated meat which, it claims, is being supplied by the Idgah abattoir. But curiously enough, the BJP ministers have refused to lift a little finger to bring about the long overdue reforms in Delhi's hospitals where human lives are endangered every day by unhygienic conditions, contaminated equipment (including syringes and even donated blood found later to be AIDS infected) and the carelessness of the doctors—recorded regularly in the newspapers. Even when the BJP supporters were coming out with letters in these newspapers shedding tears over the slaughter of innocent animals at the Idgah abattoir, and urging their government in Delhi not only to ban the killing of goats, but also chicken, over 200 members of their own fold—devout Hindus—were being hospitalised after eating holy 'prasad' to chants of the BJP slogan 'Jai Sri Ram' in the east Delhi colony of Shastri Park during the Ram Navami celebration on April 20. Soon after that, in another BJP-ruled state, Rajasthan, at least six people died of suspected food poisoning and 160 were taken ill after taking 'prasad' at the famous Kela Devi fair in Sawai Madhopur on April 28. Surely these 'prasads' did not come from the Idgah abattoir. They were pure vegetarian.

The BJP is apparently more concerned about the future of its own selected animals than the plight of human beings. Significantly, one of the first bills proposed and passed by the BJP-headed Delhi assembly is the Delhi Agricultural Cattle Preservation Bill, which envisages total prohibition of the slaughter of cows, calves, bulls and bullocks. This would deprive the poor (including the 'dalits' and the Muslims) of the meat from these animals which has been the main source of cheap protein for them. It is obvious that the pseudo-environmental concerns of the BJP actually conceal the Hindu communal urge to hit the economic interests of the minority communities.

Inlac Granston

AFTER acquiring a newly established 100 per cent export oriented unit for the manufacture of granite slabs from Srividya Granite Tile Exports, Inlac Granston now plans to modify and expand the existing tile plant and also put up a slab plant to cater to the entire range of products for customers. The unit which is situated in Dharmapuri district of Tamil Nadu presently has a capacity to manufacture 84,420 sq mtrs of granite slabs of 300 mm X 300 mm and 300 mm X 600 mm sizes per annum. Under phase one of the expansion project the company plans to install a slab plant with a capacity of 33,000 sq mtrs and also manufacture tiles of higher size up to 400 mm X 600 mm. The second phase of the project envisages increasing the capacity of the newly installed slab plant to 66,000 sq mtrs and also installing flaming machines for flame finish tiles/slabs. The new automatic tile plant will be supplied by Eisenwerk Hensel of Germany while the automated slab plant will be supplied by Mordenti of Italy. The company which enjoys equity participation by Olympia Finance, Ireland and Plattyen Investments, Vaduz has already started production and had exported goods worth Rs 2.9 crore up to September 1993. Further, it has also entered into a marketing tie-up with Hofco Naturstein Vertriebs of Germany for at least 50 per cent of its production. To part finance the project the company is entering the capital market with a public issue of 50,00,000 equity shares of Rs 10 each at par. The issue which will open for subscription on May 30 will be lead managed by SBI Capital Markets and Bank of Baroda.

Orton Synthetics

Orton Synthetics is setting up a composite project for the manufacture of texturised/twisted/fully-drawn polyester filament yarn with a capacity of 9,280 mt per annum along with a weaving complex with a capacity of 269 looms for producing 154 lakh metres of cloth per annum with processing capacity for approximately 250 lakh metres of cloth per annum. Partial commercial production of the weaving section is expected to commence in the third quarter of this year while the fabric division is expected to achieve rated capacity progressively during the fourth quarter. The project will be entitled for benefits of the 1993 scheme of incentives as it is located at Baramati which is a government declared 'C' category backward area. To part finance the Rs 76.7 crore project the company plans to tap the capital market with a public issue of 2,25,86,700 equity shares of Rs 10 each at a premium of Rs 5 per share out of which 88,86,700 equity shares have been reserved for NRIs, Indian mutual funds, foreign institutional investors and Indian financial institutions. The issue which will be lead managed by SBI Capital Markets and Allbank Finance will open for subscription on June 2.

Premier Aqua Farm

Premier Aqua Farm is setting up a semi-intensive aqua culture farm with a capacity of 400 tonnes of shrimp per annum at Kanuparthy village in the Prakasham district of Andhra Pradesh. The company has been promoted by C Anil Kumar who has considerable experience in deep-sea fishing. The company plans to cultivate white prawn and black tiger prawn which requires highly scientific and modern techniques for ensuring consistently high yield, size and quality. It has also entered into a technical assistance and 100 per cent buy-back arrangement for a period of eight years at the prevailing market price with ITC. Commercial production is to commence in December this year. To part finance its project the company plans to tap the capital market with a public issue of equity shares aggregating Rs 3.63 crore.

Pentafour Solec

Belonging to the Pentafour group, Pentafour Solec Technology is setting up a project for the manufacture of solar photo voltaic modules of various capacities ranging from 2 watts to 100 watts based on a highly innovative and new concept of solar technology. The project which will have an installed capacity of 3 mega watts is expected to commence commercial production by October this year. The company has entered into a technical assistance and buy-back agreement with from Solec International of USA. The technical agreement is for a period of five years during which time the entire technology will be transferred including future developments. In addition to the technical collaboration agreement the foreign collaborator will also have a 23.4 per cent stake in the post equity capital of the company as against the 37.6 per cent stake of the Indian promoters. To part finance the project the company plans to tap the capital market with a public issue of equity shares at par aggregating Rs 2.93 crore on May 27.

Dravya Industrial Chemicals

Dravya Industrial Chemicals (DIC), of the HAMCO group, is engaged in the manufacture of lead and lead alloys. The company is entering the capital market on May 30 with a public issue of 290 lakh equity shares of Rs 10 each at par to part finance its expansion-cum-modernisation programme. The programme undertaken by the company will have a total outlay of Rs 40 crore and envisages the setting up of two units for manufacturing lead/lead alloys at Vapi and Sarigam with an installed capacity of 7,200 tonnes per annum at each unit, aggregating to 14,400 tonnes per annum. Further in order to establish itself as a marketing organisation to cater to the requirements of industrial customers, the company is setting up sales offices all over the country and also at the international level. HAMCO, the parent company, is also transferring its marketing rights to DIC. The Sarigam unit is expected to become operational from April 1995 and trial production has already commenced at the Vapi unit.

Industrial Oxygen

Promoted by Lalit Kumar Jain and associates, the 30-year old Industrial Oxygen Company plans to enter the capital market soon with a public issue of 22.4 lakh equity shares of Rs 10 each at a premium of Rs 130 per share. The company is presently engaged in the manufacture of industrial gases, air separation plants, nitrogen PSA plants and LPG cylinders and has manufacturing facilities at 11 locations throughout the country. It is now setting up two projects at an estimated cost of Rs 42.5 crore at Wardha and Butibori in Maharashtra for the manufacture of industrial gases. The company is also implementing two industrial gases project at Karjan and Jejuri at a total outlay of Rs 20.3 crore. The issue is also for repaying its existing term loan and deferred payment guarantee and for augmenting its working capital requirement. The Wardha project was expected to go on stream last month while the Butibori project is scheduled for April 1995.

Macro economic imbalances are persisting in the new fiscal year The rate of inflation has accelerated with the composite index for food items rising by 3 2 per cent in just one month The reserve money growth of 5 5 per cent in the first three weeks of 1994 95 should similarly be a matter for concern Commoditywise trade data show a growing proportion of capital goods in total imports

STANDARD INDUSTRIES

Inflationary Pressures

DESPITE a rise in turnover, Standard Industries, the flagship company of the Stanrose group, saw a fall in profitability in 1992-93. For the six months ended September 1993 the company's profitability has fallen further with operating margin falling from 14 per cent for the 12 months ended March 1993 to 11.8 per cent for next six months. Despite the consistent fall in profitability the company has declared a bonus issue of one equity share for every two held during the period under review (the company changed its accounting period ending from March to September) resulting in an increase in equity capital by about Rs 9 crore. Further it also maintained the dividend rate at 20 per cent.

The inflationary pressures on the company's textiles division led to a squeeze on margins. Power rates increased from Rs 2.05 per Kwh to Rs 2.18 per Kwh. Further, increased working capital requirements as also the higher borrowings on account of the modernisation programme led to a sharp rise in interest charges. Following the installation and commissioning of 72 picanol air jet looms at Prabhadevi last year the company has also commissioned four VOUK draw frames, one autoconer each at the Sewree and Dewas units, one schlafhorst autoconer model 238 and 7 sohler airtext overhead cleaners for shuttleless looms. The company is also extending the modernisation programme to the processing department by installing atmospheric jigger for bleaching and by undertaking modification of the yarn dyeing plant. The company's chemicals division was also adversely affected following the liberalised import policy and the fall in international prices of caustic soda, caustic potash and potassium carbonate. The prices of caustic soda fell so steeply in the international market that even with 85 per cent duty the landed costs were far below the production costs of many units in the country As against exports of Rs 3.3 crore for the whole of last year, exports for the period under review fell to a mere Rs 1 crore. The company's newly installed potassium carbonate plant was in full operation during the period.

To part finance its ongoing modernisation projects the company plans to enter the international capital market with a euro issue of $ 30 million. The proceeds of the issue will also be used to repay/prepay high cost borrowings and debts and meet long-term working capital finance in addition to financing other approved corporate purposes.

INDIAN SEAMLESS METAL TUBES

Diversification Pays

Indian Seamless Metal Tubes, the flagship company of the Indian Seamless group, has shown improved results for 1992-93. The company's strategy of establishing diverse interests in areas such as water drilling, mineral exploration, automobiles and bearings by widening the product range to include a gamut of seamless hollows and tubes of 3,000 varying diameters (ranging from 6 mm to 200 mm) seems to have paid off over the years.

Despite the severe recessionary trends in the engineering, automobile and bearing industries, the company's net sales during the year rose by 18.7 per cent and operating profit increased by 40 per cent over the previous year. However, with interest charges rising by a sharp 74 per cent there was a lower increase in net profit of 18.5 per cent. The company's performance in the past can be spoken of in superlatives—it was the sole supplier of customised pipes to priority sectors until recently; it was the first to manufacture cold pilgered tubes in carbon and alloy steels; and it was the first to manufacture 100 per cent import substitute seamless tubes for the bearing industry. During the year under review the company installed an additional roughing and rounding mill which uses an induction heating furnace for heating the billets thus minimising material loss by way of scales.

With the conversion of part B of the fully convertible debentures issued earlier, conversion of term loan from financial institutions (FIs) into equity shares and the allotment of bonus shares of the FIs against their entitlement there was a rise in the company's equity capital to Rs 7.6 crore. To part finance the modernisation of its plant and to upgrade technology the company, issued zero per cent fully convertible debentures of Rs 270 each aggregating Rs 12.88 crore and 16 per cent secured non-convertible redeemable debentures of Rs 190 each with detachable warrants aggregating to Rs 15.1 crore on rights basis.

The devaluation of the rupee and its consequent convertibility on the trade account has boosted the company's exports which rose by 30 per cent over the previous year. This was despite the abolition of the International Price Reimbursement Scheme (IPRS) for certain grades of tubes as also the considerable delay in release of payments due under IPRS. Realising the increased scope for exports as a result of the liberalisation scenario the company has opened an office in Birmingham, United Kingdom.

With effect from September 1992, Indian Seamless Steels and Alloys ceased to be a subsidiary of the company following the former's public issue of partly convertible debentures which was oversubscribed by about eight times. The product quality of Seamless Tubes and Technologies (India), an associate of the company, has reportedly been well received in the market following the successful implementation of its project for manufacturing cold formed rings. Another associate company, namely, Indian Seamless Financial Services has doubled its income and profit in 1992-93 and has received category 'I' classification as 'Merchant Banker' from SEBI. Meanwhile Taneja Aerospace and Aviation, an aircraft project in collaboration with Partenavia, Italy, which recently entered the capital market with a public issue is reportedly progressing well as is the trainer aircraft project in collaboration with National Aeronautical Laboratory.

The company earned a net profit of Rs 3 crore on net sales of Rs 60.4 crore in the first six months of 1993-94.

MALWA COTTON SPINNING

Market Constraint

Promoted in the joint sector by Punjab State Industrial Development Corporation and Oswal Woollen Mills, Malwa Cotton Spinning Mills is engaged in the production of cotton carded yarn, viscose yarn, polyester viscose yarn and acrylic yarn. Improved demand and higher production on increased capacity in 1992-93 helped the company post a 22.7 per cent higher net sales figure. A less than proportionate rise in operating expenses resulted in a 34.4 per cent higher operating profit. However, with the company achieving its highest ever production level during the year the rise in offtake was not proportionate leading to a build up of inventories (up 122 per cent over the previous year) and this in turn has led to a steep rise of 77.8 per cent in interest charges. The completion of the company's Paonta Sahib unit expansion further led to an increase in depreciation charges by 26.9 per cent with the result that the company's net profit rose by only 16.9 per cent as compared to the sharp rise in operating profit. The company raised the dividend level from 35 per cent last year to 37 per cent in 1992-93.

Production of cotton yarn during the year was higher by 11.5 per cent at 76.6 lakh kgs while that of other synthetic yarns was higher by 14.3 per cent at 86.9 lakh kgs.

Modernisation of the Barnala unit has reportedly resulted in producing value added yarns and addition to the company's exports and the yarn produced by the unit has been well received in the domestic and international markets. The installation of 10,080 spindles at the Paonta Sahib unit which was taken up by the company in 1991-92 was completed during the year under review. The company has now undertaken a Rs 14 crore project for installing 9,600 spindles for manufacturing synthetic yarn which is in an advanced stage of completion. It has also undertaken a project of 24,192 spindles for the manufacture of cotton yarn at a total outlay of Rs 46 crore which it expects to complete on a continuous basis. Meanwhile exports rose by 6.3 per cent to Rs 25.2 crore with the company exporting acrylic yarn, synthetic/cotton blended yarn, etc, in addition to cotton yarn.

Though the company's net profit has increased in absolute terms profitability has fallen over the previous year with profit margin falling from 6.3 per cent last year to 6 per cent in 1992-93.

For the first six months of 1993-94 the company earned a net profit of Rs 7.3 crore on a net sales of Rs 101 crore and achieved a gross margin of 12.2 per cent as against a gross margin of 12 per cent for the whole of 1992-93.

MILKFOOD

Troubled Times

The largest milk converter in the private sector, Milkfood which has been promoted by the Jaiswal family (also the promoters of Jagatjit Industries) and was once known as the premier unit in the dairy industry has now fallen on troubled times. Pitched against a number of small operators in the industry following the delicensing of the industry the company is finding it difficult to meet even its daily requirement of milk supply with the result that the company's profitability has fallen drastically over the last few years.

Though the company managed to post a 7.3 per cent rise in net sales in 1992-93, operating and net profit fell by 39.6 per cent and 25.5 per cent respectively over the previous year. A sharp rise in operating expenses offset the decline in interest charges and depreciation provision. Inability to register itself through the National Dairy Development Fund (NDDF) for exports has also hampered the company's prospects. Further if the Milk and Mild Products Order of 1992 is implemented the past efforts of the company at cultivating its sources of milk supply at large costs will turn out to be useless as the Order would mean a reshuffle of areas to determine where the company has to source its milk supplies from. With ghee and other milk products accounting for up to 85 per cent of the company's revenue this could drastically affect its profitability.

The company's foray into the yoghurt business has come a cropper with the result that the product has been taken off the shelves and it is reportedly considering hiving off its yoghurt division. Its ice-cream business on the other hand seems to have caught on with the company claiming to have captured up to 35 per cent of the north Indian ice-cream market. However with ice-cream constituting only 15 per cent of its turnover this avenue of increasing total income has limited scope. Further with major foreign players making a beeline into the country competition is expected to hot up.

However, the registration problem with NDDF has now been sorted out and the release of export quota in the dairy industry by the Agro Processing Export Development Authority has raised hopes for the industry as a shortfall in production in the neighbouring countries can be taken advantage of. Further the company's foray into fast foods through its store Cafe 100 in Delhi seems to have hit the mark and it is now planning expansion in this segment.

For the six months ended September 1993 the company's performance fell drastically. Net sales dropped to Rs 28.5 crore and the company suffered a net loss of Rs 2.9 crore for the period.

RUCHI SOYA INDUSTRIES

Reduced Profitability

Ruchi Soya Industries, the flagship company of the Rs 500 crore Ruchi group, saw a decline in profit in 1992-93 over the previous year. Though the company managed to increase net sales by 29 per cent despite a fall in vegetable oil prices following the changed import policy of the government, a sharp rise in operating expenses led to a 4.8 per cent fall in operating profit with the result that the operating margin fell from 16 per cent in 1991-92 to 11.8 per cent in 1992-93. A 24.5 per cent rise in interest charges and a 98 per cent rise in depreciation charges further contributed to the 32 per cent fall in net profit. The centre's decision to import soyabean oil further hampered profitability. In spite of the fall in profitability the company maintained the dividend rate at 20 per cent on the higher equity capital which entailed a rise of 70 per cent in dividend outgo.

With the rationalisation of its soya food processing unit, refinery and vanaspati plant, the company expects better capacity utilisation in the future. The expansion project undertaken by the company is being implemented as per schedule. The company's exports rose by 12 per cent over the previous year while those of its subsidiary, namely, Ruchi International rose to Rs 21.4 crore giving a combined increase of 103 per cent over total exports in the previous year.

To part finance its expansion programme the company entered the capital market during the year with a rights issue of equity shares aggregating Rs 39.1 crore in August 1992. The rights issue has led to an increase of Rs 6 crore in the company's equity capital. The vanaspati plant, one of the expansion projects of the company, was commissioned in September 1993 in addition to the commissioning of its new soya lecithin plant (with an installed capacity of 600 tonnes) in Madhya Pradesh. Soya lecithin is being used as an emulsifier, an import substitute product and is marketed in the bread and biscuits industry. In addition the company is also exploring its export prospects. The possibility of imports of soyabean oil being less than expected due to a good soyabean crop in the country has led to delay in the company's export-oriented project which was based on the strategy of exporting meals and importing oil. The company has also developed a strategy for procurement of raw materials for the entire year which envisages the use of sunflower as a substitute during the summer season in addition to soyabean and rapeseed, which can be used for producing vanaspati and refined oil and to meet the yearly capacity utilisation of the plant.

For the first half of 1993-94 Ruchi Soya notched a net profit of Rs 9.1 crore on net sales of Rs 80.9 crore.

The Demise of Fabian Socialism—and of Market Capitalism

Arun Ghosh

With the collapse of the erstwhile communist regimes in eastern Europe, socialism as a credo has suffered a severe setback. But we also need to reflect on an interesting development in recent years, the death of 'market capitalism'.

FABIAN socialism has been dead around the world for some decades now. With the passing away of Robi Dutt at New Delhi on April 4, the last staunch, stalwart protagonist of Fabian socialism in India has also gone from our midst. R C Dutt had the right credentials for the somewhat unusual views he held for a once-functioning member of the Indian Civil Service. After all, Robi Dutt was a scion, a grandnephew, of Romesh Chandra Dutt, who was the first to repudiate the British view of Indian history—as written for school children by the likes of Stanley Lane-Poole among many others—who first rewrote a cogent and coherent history of British India, who looked at history not merely as a history of political rulers, as a matter of dates of assassinations, of the ascendancy of one despot in place of another, but as an economic history of an evolving people, of the evolution of struggles, of institutions which build civil society.

Robi Dutt, with his aristocratic and ancestral intellectual background—he came from the family of the Dutts of Rambagan in Calcutta—had natural leanings towards what is now described somewhat disparagingly as Leftist views. Romesh Dutt's heritage was not lost on Robi Dutt; and in his official life, he remained a very good friend of the likes of Parameshwar Nath Haksar, who correctly saw the nationalisation of banking as the practical means of achieving a socialist society which Jawaharlal Nehru has dreamed of introducing through state intervention in production and distribution, *a la* the USSR model. Robi Dutt's good fortune was that within a decade of his joining the Indian Civil Service (in 1937), India became independent; with independence and with Jawaharlal Nehru's vision of a 'socialist pattern of society' in India and his—and Mahalanobis'—vision of using the state to bring about the economic transformation of the people of this country, there was room for a competent administrator to play a useful role in the build-up of the institutions necessary for the socio-economic uplift of the Indian people. Robi Dutt served in pre-Partition Bengal in diverse capacities before he came to the centre as an administrator. He got his first—for him really relevant—opportunity for the application of the progressive (and liberal) views he held as the chief executive of the then National Coal Development Corporation (with headquarters at Ranchi) between 1959 and 1964; and later, he was to serve as secretary to diverse economic ministries of the government of India until his retirement in 1972. Even while in government, Robi Dutt gave expression to his strongly Fabian views in the minute of dissent he wrote as a member of the Monopolies Commission in 1964, when he put in a strong plea against allowing the growth of private monopoly power in the economic life of the country. But it was really after his retirement from government that Robi Dutt's genius and his penchant for a coherent and socialist system of planning for the development of India found full expression. In the numerous volumes he wrote, in the seminars and discussions he organised at the India International Centre—first as a convenor of the Economic Affairs group and later as a convenor of the Social Affairs group—Robi Dutt kept working away till the end. On the evening of his death, he was at his desk till five in the evening, working on a seminar on federalism in India. It was only after 5 p m that he felt a little cold and uncomfortable, a feeling that lasted a bare two hours before he breathed his last, at the age of 82. The last few years of his life were spent in extensive writing and speaking on the problems of socialism in crisis, on the role of state enterprises in a developing economy, on the importance of planning in an underdeveloped society, with its problems of inequalities, lack of social and economic infrastructure, lack of education, of health, of nutrition, and with the ravages of malnutrition and ill-health affecting the productivity of workers, and afflicting society.

But Robi Dutt belonged essentially to a past generation of perfect gentlemen. A Fabian socialist by persuasion, he did not really come to grips with the reality that Fabian socialism had faded away even in Britain, even earlier than its fading away in India. The Reagan-Thatcher emphasis on 'supply side economics', on creating more space for the private sector at the expense of the public sector reflects the emergence of international finance capital, the increasing dominance of multinational companies (or transnational corporations as it is now fashionable to call them) in the production process from the decade of the 70s onwards. Today, all policies around the world are dictated by the interests of TNCs and international finance capital. And the power of these forces makes nonsense of the type of market capitalism advocated by Adam Smith, of the general equilibrium system under conditions of free competition as dreamed of by Leon Walras, of the continuing 'creative destruction' as outlined by Joseph Schumpeter, and even of the Keynesian programme of pump priming by the state so as to help effective demand to keep up with market supplies under the capitalist system

No Sense of History

Let us face it. With the collapse of the erstwhile communist regimes in eastern Europe, socialism as a credo has suffered a severe setback. But we also need to reflect on an interesting development in recent years, the death of 'market capitalism'. We need to reflect on this development But let us digress for a moment.

The sight of intelligent human beings, highly talented people—capable of sending space shuttles to probe the skies, plumb the depth of the seas to investigate the earliest forms of life (which are apparently capable of oxidising sulphides for their sustenance at the bottom of the ocean, where there is no oxygen because of volcanic eruptions with heavy metal residues at temperatures of some 350°c sent up from the bowels of the earth into the ocean base), and of sending perfect, 'high density' communication pictures via the satellite from one side of the globe to exactly the opposite side—unable to perceive the unfolding of the process of economic history of human kind is indeed strange.

Of course, specialists—experts in their own fields—have to necessarily rely on the experience and judgment of experts in other fields; and the more specialised an expert, the greater is his dependence on other experts. But, for every physical scientist, one can find a score of social scientists; and one wonders how and where the latter have lost their sense of history. Where, in particular, are the economists of yester-year who propounded a theory of development?

Consider the theory of markets. John Hicks was probably among the first among economists to produce a complete and cogent theory of the evolution of the market as the basis of economic development Hicks was wrong inasmuch as he exaggerated, and placed

the growth of markets as the *sine qua non* of economic development Markets of sorts have existed long before economic development as we know it really exploded on the earth That development, initiated by the Industrial Revolution, has now been greatly accelerated by artificial intelligence, by genetic mutation, by the possibilities of harnessing the latent energy in Nature for the use of man The growth of markets and scientific discoveries and inventions—and innovations to apply inventions to practical use—have interacted, each has fed the other each has spurred the growth of the other Markets could not have grown but for the rapid strides in labour productivity, nor the latter without growing markets

That much is clear What is not clear is the new fetishism of the neo-liberal economists in regard to their faith in the market system as the best means of achieving an optimum equilibrium as the best regulator of production activities and the distribution of the social product

The Walrasian 'general equilibrium' was at least a theoretical possibility in a world with a large number of independent producers and consumers But the real world of today is vastly different In 1992, a mere 200 multinational giants had sales of $ 5 9 trillion, and 172 of them (originating in five countries) accounted for sales of $ 5 2 trillion (See 'World's Top 200 Mega Corporations Foundations of the Economic Gulag by Frederic F Clairmont and John H Cavanagh, *EPW* February 5, 1994, p 284) Their share of world trade is not known, but considering the fact that the total volume of world exports, as of 1988, was no more than $ 3 trillion (vide, UNCTAD, *Report on Trade and Development, 1989*), one can be reasonably sure that a substantial part of total exports of the world was made by the MNCs and, in fact, quite a significant volume of such trade was intra-MNC flows of materials, components and even final products.

Capitalism in Crisis

Ever since the middle of the 60s, the capitalist system has been in increasing trouble, the beginnings of the sort of trouble that had engulfed the world in the 30s, after the onset of the Great Depression in 1929 The fissures deepened in the 70s, with the dollar going off the gold standard, with the break down of the Bretton Woods system, and with the oil producers revolting against the exploitation of their natural resources for keeping up the living standards of the industrially developed world Stagflation was the order of the day in the OECD countries in the decades of the 70s and 80s, and the remedy sought—the savage monetary discipline introduced to tame inflation—created long-term unemployment of an average of some 10 per cent of the workforce of the industrially developed countries (not counting Japan) That is still the order of overt unemployment in western Europe, though some new members of the EEC are much worse off

In the late 80s, we have the sudden and precipitate collapse of the socialist system in eastern Europe, and in a couple of years, the world view changed dramatically Quite obviously, the type of command economy, the precise mode of central planning adopted by these countries did not bring panacea to the people of these countries That is clear. But the signals were misinterpreted to imply that the alternative is unbridled market capitalism In fact, that gospel spread because the capitalist world saw in the vast areas of eastern Europe a large potential market. The fact that the developed countries themselves had a perpetual problem of inadequacy of demand, that they had to have a large unemployed workforce, that their experiment at Keynesian state intervention had led in the 70s to inflation—partly because of the accident of a sudden rise in oil prices, but even more importantly because Keynesian pump priming does *not* solve the basic problems of imbalance between market supply and market demand inherent in the capitalist system, because of inequalities in the distribution of income—led the developed countries (and the powerful interests therein) to press for an international economic order that is best defined as a dream world for MNCs and for international finance capital

Consider the situation. The OECD countries are obviously unable to market all that they (and their MNCs) are capable of producing. Nor are they in a position to invest all the savings that are getting generated. In fact, international finance capital is not even interested in long-term investment. At this crucial conjuncture of history, the collapse of eastern Europe comes as a 'saviour' of the capitalist system in western Europe.

The folly of the ruling elite in India is another windfall to be exploited and comes in handy. India is also a huge potential market for industrially developed countries. Eastern Europe—particularly Russia—has not quite switched over to playing the game as preplanned; they are totally lacking in the 'institutions' which can make for a functioning market economy. But India has most of the required institutions, for India has never been anything but a capitalist economy, only superimposing certain central planning decisions on market-led production and investments. The markets in eastern Europe need to be developed; the market in India is ready for the picking.

International Finance Capital

Two points need to be emphasised here. The common man does not know of these two obvious truisms, but it is difficult to accept the fact that economists cannot see through the maze. First, of course, is the nature of capitalist production today. Industrial production around the globe is controlled by, may be, between a hundred and five hundred multinational companies. And, the MNCs owe no allegiance to a country. The fact that most of the MNCs originate in the US or in western Europe or in Japan, makes the governments of these countries pursue the policies that suit the MNCs.

Secondly, MNCs do not need external finance; they have large surpluses which they can themselves invest. But, outside of the MNCs, there is a large and growing corpus of funds. International finance capital today has command over considerably more than 7,000 billion US dollars. These are floating funds, seeking to make profits out of 'trade in assets'. International finance capital is not interested in financing either production activity or trade in goods. Trade in assets gives larger and quicker (short) term profits. It is interesting to note that not so far back, one man, George Soros, was able to put in more money than the Bank of England could garner, to save the British pound. It was not so long ago that the UK had to opt out of the Exchange Rate Mechanism (ERM) of the European Economic Community; the Bank of England put in some $ 7 billion to save the pound, and ultimately had to surrender. Reportedly, George Soros netted something like $ 2 billion as his net gain from the transaction, for the pound had to be devalued. And, with the pound went the Italian lira; and the narrow band within which European currencies were allowed to fluctuate—the 'Snake'—had to be considerably widened.

That is the type of operation in which international finance capital is interested. Speculation in real estate, speculative investments in financial assets, leveraged buying-out operations, speculation in currency fluctuations, these are the *modus operandi* of international finance capital.

As a consequence of the two facts of life today indicated above, we have to understand the purposes, the motivations, the objectives of the power brokers in the developed countries of the world, the giant MNCs (like Exxon for instance) and international finance capital (the bankers, the 'fund managers', the very substantial 'brokers', the Rothschilds of this world). It is they who dictate both political and economic policies. It is they who are interested in arms sales to garner more profits, for which limited wars (outside west Europe and North America) can and must be kept going; tensions between neighbouring countries—and sometimes within the same country—in Asia, Africa and Latin America must be kept up. Arms sales are important for business. Arms sales also yield large profits. Bribery, corruption, chicanery and duplicity of the worst kind must necessarily be part of the strategy to keep up the arms trade Political theorists understand this, even though they may not quite understand the processes of the functioning of international finance capital.

'Market Access'

That the MNCs and international finance capital dominate economic policy-making around the globe can be seen from two results of their pressures and their operations. One piece of evidence is the humiliating surrender of the pound sterling to the onslaught of George Soros. The same goes for other aspects of policy-making. The seemingly powerful president of the US, William Jefferson Clinton, has less effective power than the combined power of the chief executives of Citicorp, Citibank and Bankamerica. They and their interests dictate US policy.

The second obvious piece of evidence is the final text of the reformed GATT treaty, signed at Marrakesh on April 15, with its focus on Intellectual Property Rights, on trade in services, on international capital flows (which must be permitted freely), on the provision for 'cross retaliation' where a developed country is not satisfied about the adequacy of 'market access' provided to the powerful MNCs by the developing countries.

Mark the words, 'Market access'—and not competition—is the objective of the MNCs today. That is the present capitalist system for you, that is the international economic order being pushed into place, with the 'promise' of $ 200 billion of gain in world trade as a result of the GATT. (Who dreamed up this figure is not known; the basis of the calculations is even more obscure.) The objectives of the MNCs are also well served by the provisions relating to Intellectual Property Rights in the new GATT treaty. The objectives of international finance capital are well served by the provisions relating to free trade in services (banking, for instance), and free flows of capital.

So the new international order ushered in by the GATT will essentially help to serve the interests of the MNCs on the one hand and of international finance capital on the other.

We stated at the outset that the growth of markets led, at a certain point of time, to economic growth. Markets existed even before the 'Industrial Revolution'. But one cannot say that there was large-scale economic growth before the industrial revolution. The industrial revolution led to growth; one can add that the very process of the industrial revolution was greatly facilitated by the growth of markets. But, even in the 19th century, the growth of markets was facilitated by imperial conquests.

In the 20th century, we do not need (nor talk of) imperial conquests. Political control is no longer necessary; economic and financial control is invisible, more insidious, more pervasive. The paeons sung in praise of 'market-led development' and the superiority of the free market system is intended for the brainwashing of the citizenry of developing countries.

Consider the facts again. Without an expanding market in eastern Europe and in the developing countries, what would be outcome of market capitalism in the OECD countries? France has an unemployment rate today of 12 per cent, the UK of 11.5 per cent; united Germany of 10 per cent (One can leave out the likes of Spain with 20 per cent unemployment, and of Poland—now seeking to embrace market capitalism—with 30 per cent unemployment) Of course, the US has a lower rate of unemployment, varying between 6 and 7 per cent, and Japan an even lower one. But Japan has always been an exception to the OECD ethos, with its high rate of saving and high export surplus, for which a market must be found And the US and Japan have now locked horns in regard to better trade balance between the two. Talk of multilateralism in the GATT, but deal directly to secure better bilateral trade balance, that appears to be the practice of developed countries.

Let us try and piece together the diverse threads of the argument Under the capitalist system, historically, supply tends to exceed demand. Quite apart from isolated 'under consumption theorists', Rosa Luxemburg had convincingly argued this point in a critique of Marx. There are diverse reasons for this state of affairs, which we need not go into. But briefly, the very process of capital accumulation necessarily leads to an unequal distribution of income which in turn leads to a gradual slackening of effective demand in relation to supplies This process is inherent in the very system; and the Keynes-Kalecki

revolution of economic thinking was an attempt to 'moderate' the capitalist system and use state intervention to get over this difficulty.

So the capitalist system needs to always search for new markets. In the 19th century, this search for new markets led to political domination by imperial powers. Even so, the system could not quite cope, as the Great Depression of the 30s of this century testifies. In the last decade of the 20th century, we do not need political domination. And, in a unipolar world, economic power can be exercised relentlessly, for greater market access for the products of developed countries, for the protection of Intellectual Property Rights—thereby sealing the production frontiers in developing countries—and for freedom of capital movements so that the acquisition and sale of asserts can give greater short-term gains to international finance capital.

Where Are the Economists?

What earthly chance does Fabian socialism have in this framework? We bemoan the death of Fabian socialism, yet we do not quite appreciate that Fabian socialism just cannot work in a world order in an economic framework where there is unheard of concentration of power over resources. Real resources are, of course, the men, the materials, nature's bounty, and the extent of human control over nature's bounty. But the control over these resources is exercised by money power. This is simple logic which every villager in India can understand; the landlord, the moneylender exercises power over the landless labourer and the perpetual borrower in ways that the intellectual middle classes in metropolitan areas cannot fathom. And what happens in an Indian village gets replicated, though in much greater magnitude in the global village, in the era of satellite television and FAX messages.

Not everyone, unaware of the resource power of MNCs and of international finance capital would, of course, know the *raison d'etre* of recent happenings around the globe. But where have all the economists of yesteryear gone? There is a galaxy of names of Indian economists, many of them more deserving of a Nobel prize than some recent Nobel laureates; and there has been an eerie silence from this group. Some, one is aware, have been co-opted by the system; but certainly, not all of them. Have they just given up? Or is personal well-being so important?

But the above rumination is by way of an aside. We bemoan the death of Fabian socialism. We should equally bemoan the impending death of the 'market system'. Not that the market system is capable of solving the problem of distribution of the steadily growing social product. But, at least in theory, the Walrasian general equilibrium can lead to optimum production, and that optimum would lead to the distribution of the social product among all participants in the production process. The care of the young, the succour of the old may not be covered by an increasingly self-loving self-aggrandising population, but that leads on to diverse other questions of social and moral philosophy. We should concede that under conditions of perfect competition, a Walrasian optimum is possible.

But is that possible under today's conditions of monopoly capital (by way of MNCs) controlling production, and of international finance capital (with its proneness to making speculative short-term gains) ordering even political processes? Market capitalism is dead; what we have is a struggle among (financial) imperial powers to carve out the world market amongst themselves. That is the reality, that is what explains the reformulated GATT, signed by 127 countries on April 15, 1994.

Is there then no hope for the future of mankind? One does not know whether some evil genius would destroy life on earth through some scientific misadventure. But, on the economic front, there is no real reason for pessimism in the long run. Increasingly, one finds that even the most powerful nations cannot always keep the spirit of man subjugated around the world. The saga of the Vietnam war is behind us, but the withdrawal of UN troops from Somalia, the impotence of the UN in Bosnia, the failure of the great powers to bring any semblance of peace in Lebanon or in the Palestinian territories occupied by Israel, are evidence of the indomitable spirit of man to fight for his identity.

It has been relatively easier to co-opt certain vested interests in the economic sphere. But here also, the great powers need local compradors; and compradors, as history has shown time and again, never last very long.

One need not despair; for India is a large agricultural country, with some two-thirds of its workforce still dependent on agriculture. And India possesses a scientific-cum-tech-nical manpower which can again rebuild the industrial economy. Only, every day, it becomes ever more difficult to shake off the after-effects of the policies adopted over the past decade.

Contrary to opt-repeated statements that the economic policies adopted since July 1991 are irreversible, one can verily say that *all* policies are reversible; the after-effects of some policies are not. Nor is it going to be easy to wash off the rampant corruption of the mind that has been positively encouraged for some time.

Fabian socialists always dreamed of orderly change. Robi Dutt was no exception; and he had reason to be optimistic in the 50s and 60s, and perhaps even in the 70s. With the onset of the 80s, both the Indian and the international scenarios have undergone dramatic changes. Perhaps the future may not see the orderly change that Fabian socialists dreamed of. But change is inevitable, change is the law of nature; and the dialectics of change cannot always be forecast. We need not bemoan the death of Fabian socialism because its alternative, market capitalism is also dead.

Education Dilemma

Sadhna Saxena

Between 'education' and 'no education' lies a world Intellectuals seldom delve into this troublesome region, which challenges their beliefs and their position as benevolent educators

LANDLESS and propertyless people in Chattisgarh are called 'sukhvasis'—happy residents, since they have nothing to loose, nothing to protect and hence supposedly no worries So, even migrant workers may be referred to as sukhvasis Most of them own no land, or possess only a small unirrigated piece

Among literate people ('padhe likhe log'), including government circles, migration is called 'palayan' (escape) One senior district level bureaucrat from Bilaspur told one researcher, 'Now it has become their habit They have everything at home but still they migrate Just to make some extra money they leave their homes every year' The irony is that these sukhvasis do palayan to survive They travel long distances along with their small children, leaving their homes to remain away for months every year and sometimes for years together Forced to do physical work beyond human limits they face ruthless economic exploitation and women face sexual exploitation too At sites such as brick kilns they may be imprisoned virtually as slaves, kept behind barbed wires under the strict vigilance of contractors 'goondas' until the end of the job No way can they escape or indulge in palayan from such bondage

Most of the agricultural area in Chattisgarh is single crop area and migration begins immediately after paddy harvesting or during Chattisgarh's rather frequent famines During the last three decades of the 19th century this region was perpetually under famine This coincided with the opening of the rail road linking Chattisgarh, Asansol and Nagpur, starting the process of migration which continues till today So, migration is a fact of life for the workers of Chhatisgarh Whether they migrate in search of illusive 'sukh' (happiness, which they are already supposed to possess) or 'extra money' (which they are supposed to be making through inhumane labour) is an ideological question

In May 1993, a workshop involving about 35 women migrant workers of Chattisgarh was organised in Raipur by Rupantar, a Raipur-based voluntary organisation The participants were middle-aged women who had worked in far-off places like Sambalpur, Haryana, Delhi, Hyderabad, Jammu and Kashmir, Madras, etc Their normal practice is to leave their older children and parents behind for continuing their studies and looking after the house respectively Most of the women had been brick kiln workers However, several of them had also worked on construction sites of buildings, bridges, dams and thermal power stations, etc Rupantar has conducted an intensive study on women migrant workers of Chattisgarh and is planning to start health education programme with them This workshop was their first effort in this direction The workshop aimed to explore in three parts issues of health, education and the law affecting the migrant workers and share information with them on these issues Rupantar had invited outside resource persons for conducting these sessions People who were invited to lead the sessions on women s health and education included three persons who had rich experience of working with village women agricultural workers, school teachers, mine workers, etc However they discussed education with migrant workers for the first time

During the introductory session, each one of the migrant worker talked about her life as a migrant worker They gave vivid accounts of their harsh experiences with contractors, sub-contractors and sardars (who gather and transport workers), their struggle in unknown lands to get the promised wages, of uncompensated accidents and deaths of children and fellow workers, etc

The stark realities of their lives, their brave day-to-day struggle and their unstable life made us imagine how remote a subject like education would be for them My colleague and I decided to ask them to tell us about even their remotest experiences with education Primarily we thought we would hear how their children cannot fit into the existing education system, how their studies get disrupted, or how they are thrown out of schools because of long absences In general, we anticipated a low level of motivation towards formal schooling Since the women were illiterate, we expected a low level of literacy amongst their children also While preparing for the workshop sessions, we had wondered how we might suggest any meaningful and positive solutions to them If children migrate along with their families, how could breaks in their education be taken care of, that is, if they join schools in the first place? We wondered if special schools for migrant workers' children could be a worthwhile and feasible solution All of us know what a farce non-formal education (NFE) type of programmes have become In view of that, are special schools desirable at all? Considering the situation of migrant labourers for the first time, we did not have any answers

Interestingly, of these 35 women about one-third had made efforts to go to school but had dropped out within a few days or weeks due to a variety of reasons including mother's death, brother's death, looking after younger siblings and managing the household At least two women said that they had been denied admission in schools by school authorities since there were no women teachers. One said that she could not continue going to school after the fourth day as it was five villages away and she could not stand staying hungry during long school hours and walking many kilometres everyday For her, school had been a punishment However, others said they wanted to study for a better life One woman had been taught by her father at home, which enables her now to read the *Ramayana* and posters This she stated with pride and confidence, repenting, however, that she had not been able to study up to class IV or V This, she thought, might have got her a job and respite from the drudgery of hard labour Contrary to our expectation their motivation for formal schooling was very high

However, it is when they began talking about their children's education that all our assumptions turned out to be wrong They showed us how little we understood about this set of people who continuously struggle for mere survival, yet still hope for a better life Surprisingly, these women somehow seemed to have had taken care of most of the practical obstacles None of our constructed worries in fact emerged as a problem We were astonished to find that each woman, except for two, had sent one or more of her children, including girls, to schools The motivation to educate them was so strong that they ate less, ate only 'bhaji' (green leafy vegetables) at times but sent their children to schools They left them behind with their neighbours, grand parents or other relatives to continue in school while they made bricks and built roads in far off cities Although not all were so lucky in managing to avoid discontinuity in their children's schooling, their spirit was touching and heartening They were motivated by aversion against seeing their children suffer the way they themselves have been suffering Also, they pinned their hopes on their children getting jobs "When we will no longer be able to walk around, at least they will feed us if they get jobs", Bhuribai said Despite such high motivation and hope children of two women could not get beyond class IV However, children of the other women managed to study up to

class VIII, high school, class XII, and a few women's children were now ITI diploma holders and graduates. One was even a post-graduate! Some younger children are still studying and they are doing well.

We thought it was remarkable that these 'first generation learners' without much academic help had reached such educational levels despite all odds. Their parents spent their hard-earned money for buying books and bribing the teachers for their admissions. Chhedin Bai was particularly very upset about the cut which teachers demand out of their children's scholarships. "Tell us how we should control this", she asked pointedly. It was so unexpected for us that for a while we did not know what to say. It was a kind of success story, and probably secretly we were relieved that at least some people had made it! Little did we realise that this achievement could itself lead to immense disappointment to the migrant workers. Almost all the educated grown-up children are now sitting unemployed. "What should these children do now? They are sitting idle. They are neither fit nor willing to do the hard jobs. We did not prepare them for this either. We nearly starved to educate them. What do we do now", said Sukhvanti Bai. "We survived on bhaji, hoping for better days. Now my children do not want to study further. They say if they have to do hard physical jobs only why should they study?", said Baratin Bai. "Our children's situation is worse than before. They can't bear the heat, can't do hard physical work and there aren't any jobs for them", said Pyari Bai. Anxious about their children's and their own future, they were feeling let down. Every single woman expressed such anguished disappointment.

We were struck speechless, at a loss how to proceed, our neat priorities having been shred apart by their unfolded life experiences. A woman broke the stalemate when she dropped the comment, "even if our children are not getting jobs, at least they have got 'buddhi' (wisdom) through education!" Some people snatched this opportunity to reinforce this with standard messages about how education should create awareness and increase one's knowledge base and how the buddhi it gives can help fight for rights like minimum wages for labour. If these women are educated enough to know about their exact working hours, etc, contractors would not be able to exploit them. We felt uncomfortable with this escape, since memories of these 'illiterate' women's struggle with the sardars and contractors to get their dues were too fresh as yet. And it is well known that workers do not wait for educationists to teach them about their rights. They learn this and earn minimum wages through political struggles. Still, some of us proceeded to suggest that buddhi is of the most importance and education is not just for jobs. A clash of perspectives and needs thus clearly emerged. Persons who literally had starved themselves to educate their children, hoping that their children would not have to starve in turn, were now urged to believe that education is not for jobs but for buddhi!

The problem of educated unemployed was brought further into focus by Motilal, a local resource person, a middle-aged man. Narrating his experience, he said, "I am a graduate. We are eight brothers. One of my brothers is an MA. Both of us are unemployed. During 1985 famine our whole family migrated to Delhi and we worked at Badarpur Thermal Power Station. We were there for two years. My three younger brothers did odd jobs at the construction sites. They met lots of people and began to work with some truck drivers. They managed to learn driving, and now two of them have got regular jobs as truck drivers. They did not study beyond class V. They are self made. The third one of them will also get a similar job while two of us remain unemployed." Then he hastily added that both of them work "sometimes on their own fields and sometime as labourers on others' land, and they do not mind it".

Finally, we asked the women what they have ultimately gained by educating their children. Sukhbara Bai painfully concluded the session, saying, "I am still a migrant worker. During every lean season, my family has to leave home and go out in search of work. We go as far as Jammu and Kashmir. My son is 12th pass. He is jobless, sits idle at home. He cannot do hard work like us. This time I took him with me and pleaded with the sardar that he is educated, he cannot stand the sun's heat, please give him some light work. Probably, he would have been better off without going to school. This is what we have achieved by educating our children."

This aptly sums up the debate on the relevance of the present education system in the existing socio-political and economic matrix. Who is it for? What is it for? Whose quality of life improves? We made feeble gestures to soften the shock by commenting that migrant workers have wide exposure and so even if they do not get jobs, they would manage somehow. However, this does not reduce the significance of clearly articulated questions of these women. The relationships between formal education, wisdom, knowledge and employment are not linear or straight forward and these women at the receiving end are the victims of the disjunction between these variables.

Here the role of intellectuals also comes up for questions. Negative experiences honestly articulated sometimes brings forth questions by some of us—"should there be no laws since they don't get implemented? Should there be no education?" These are irresponsible queries as all of us are aware that between 'education' and 'no education' there lies a whole world. People seldom let themselves sink into this troublesome world which challenges their beliefs and position as benevolent educators, and sometimes even the rationale for a meaningful existence.

Torture, Human Rights, Legal Rights

Gobinda Mukhoty

Despite repeated exposures by journalists and human rights organisations and intervention by courts, torture is pervasive and a daily routine in every one of India's states, irrespective of whether the arrests are made by the police, paramilitary forces or army. It happens regardless of the political persuasion of the party in power. The government's persistent failure to acknowledge it serves to ensure that the established patterns of its practice throughout India will continue.

"THOSE who live by the side of a police lock-up must have heard screams of people held by the police. In the next day's paper, they read that an arrested person in the same lock-up has committed suicide" (APDR). Is it an exception or the routine? Jyoti Basu, chief minister of West Bengal, declared on October 20, 1987: "In a civilised country, there cannot be a murder in a lock-up".

Late Rajiv Gandhi, prime minister of India, in January 1988, gave an interview to Panorama, a British television and declared: "We don't torture anybody. I can be very categorical about that. Wherever we have had complaints of torture, we have had it checked and we have not found it to be true".

APDR in its report mentioned that between 1977-1989, in the state of West Bengal, run by a 'civilised' government, there were 82 deaths by torture in police lock-ups. APDR named the persons concerned and the 'thanas' and also dates of such killings by torture. Therefore, there was all "quiet on the eastern front."

From 1982-1989, in Bombay, there have been torture killings in police lock-ups numbering 8-12 every year. During the same period, Delhi and Andhra Pradesh saw 48 and 118 such murders, respectively.

On June 26, 1989, in Shalimar Bagh, Delhi, children aged between 6-12, were stripped, beaten and burnt with cigarette butts by the police, the allegation against them being that they had committed theft.

A report on human rights violation and state terrorism in Assam during Operation Rhino of September 1991 has brought out the following:

"During house search, all male members were dragged out, some even from bed, and were manhandled and beaten up at home itself. Women folk were abused, some were slapped, some even hit by rifle and even there were many cases of sexual molestation. Most of the male members, specially younger ones (but actually irrespective of age), were rounded up. They were taken to two interrogation camps, one situated in the field of the local school, another at about 2.5 km away from the village inside a reserve forest at the bank of Ghagar river. Most of the men were beaten on way to these camps. In fact, the army jawans forced the men to carry them on their backs over a muddy and swampy area. Even when the jawans were riding their human horses, they did not stop beating the men carrying them. The major in-charge of the operation rode on the back of a respected elderly teacher of the village.

"In the camp areas the people were humiliated and punished in various ways:

— They were made to kneel down facing the sun.

— They were made to run in circles or to do frog jumps till they fell down exhausted.

— They were kept without food or water and even during these degrading punishments, were kicked, beaten, whipped from time to time, especially when they fell down from exhaustion. During interrogation and also during house search the common question was 'Ulfa Kahan Hai?' (where is Ulfa?) During the investigations and from the written submission as well, it became clear that the army conducted the raid not looking for someone or something specifically, but to terrorise and to try their luck in ferreting out some worthwhile information from terrorised villagers.

"During the interrogations of the villagers, one after another they were subjected to merciless beating with lathis, rifle butts and whips, many were kicked, punched and trampled on the ground. A few were stripped and electric shocks were applied to their body including private parts. Hairs were pulled out. A few were crammed into a small cage and kept locked. The villagers describe the interrogation camp at the bank of Ghagar river as a virtual hell, filled with the screams of the damned and shouts and abuses of the tormentors.

"The most interesting point is that in this mass interrogation and raid the army failed to catch a single hardcore insurgent. Most of the people rounded up were released by evening or night.

"Methods of interrogation and torture are grisly. Many of these procedures are adopted not only for interrogation but are done at random—because most of the times people were not interrogated properly but nevertheless tortured. Torture acquires an independent existence—a momentum of its own and a sadistic sinister underpinning. This makes it a tool for creating pure terror.

"The methods used are as follows:

(1)— *Beating* both in public view, at home before family members and also inside the army camps by hands, lathis, rifle butts, whips.
— Punching in face, head and abdomen.
— Kicking in chest, abdomen and back.
— Trampling and kicking a man, made to lie down on ground.
— Beating with lathis on soles of foot.

(2)— *Hanging* the person from ceiling beams by hands.
— Hanging from tree, in upside down position.
— Hanging the person by one hand only, other hand bound behind back.
— After a person is so hanged, he is severely beaten or other forms of torture are carried out.

(3)— *Wet submarine treatment*—immersing the head of the person in a bucket or drum of water till he is nearly drowned.

(4)— *Continuously pouring water* over the mouth and nose of a person after he is bound up and immobilised till he is nearly suffocated.

(5)—*Staking*—a person is made to lie down on ground, either face up or face down position, and his hands and feet are tied in a spread-eagled manner to stakes driven to ground. By this method a person is totally immobilised. Then he is beaten, kicked or trampled under boots or tortured in other ways. Sometimes lathi is rolled forcibly over his back by two soldiers causing blood vomiting and evacuation of bowels in severe pain.

(6)— *Keeping bound up* in an uncomfortable siting position to a stake or tent pole for hours, even days together.

(7)— *Frame treatment*—a person is bound spread-eagled to a vertical rectangular wooden frame, and thus immobilised is tortured.

(8)— *Giving electric shock*—electric shock is given from a 12 volt car battery or directly from domestic mains. Shocks are given to head, eyes, cheeks, ears, neck, shoulders, armpits, back and even to private parts.

(9)— Uprooting hairs by pinchers from head, eyebrow, armpit and even pubic hair.

(10)— Hitting a person on his genitalia and testicles till he becomes unconscious from pain.

(11)— Applying chilli powder to eyes with the hands bound behind his back, and also to anus.

(12)— Forcefully pulling apart the legs by two soldiers, resulting in tear of the

(13)— Pushing a stout lathi, smeared with chilli powder and petrol, through the anus.

(14)— Burning with lighted cigarette butts. Such burns are even given to private parts.

(15)— Sticking pins all over the body

(16)— Burying in ground up to neck and covering the head with a bucket.

(17)— Denying food and water for days together.

(18)— General physical punishment and humiliations. Usually large groups are subjected to these People are lined up in a field or in camps, sometimes in full view of the womenfolk, and are forced to do the following

(a) To kneel facing the sun for hours.

(b) To stand naked in sun and rain.

(c) To stand in waist-deep or neck-deep water for hours

(d) To perform frog jumps till the person is exhausted.

(e) To run in circles.

(f) To carry army jawans on back over long distances

(g) To perform sit-ups holding the ears.

(h) Forcing to eat sand, earth or to drink alcohol and filthy water.

"During all these the army uses filthy and abusive language. Most of the times, specifically during night time, the army jawans are drunk.

"During raids and searches army jawans usually misbehave with the women. At the slightest pretext, they lay hands on women, pull them by hand, pull away clothes, sometimes actually strip them naked. Molestation and attempted molestation are occurring everyday. Passing obscene remarks has become so common that this is not even complained of by the women. Incidents of rape have occurred. A few girls have been gang raped to death A lot of rape incidents have not yet come to light because of social sanctions and humiliations that the victims have to face afterwards. A heinous incident of confining two women to their homes and repeatedly raping them every night by army jawans has also come to light. Even young boys have not escaped from perverted sexual assaults.

"All the blood-curdling modalities of torture listed above are tabulated from actual interviews and signed statements of the victims. Many other methods of torture that have been used are not tabulated here because such statements are not at hand. This list alone is sufficient to show what is actually happening after illegal detention and interrogation carried out by the armed forces.

"During such interrogation the victims are almost always tightly blindfolded so that afterwards they cannot identify their tormentors. The most disturbing features of the widespread inhuman torture are as follows:

(1) Persons tortured are losing their mental balance, suffering from severe insomnia and are becoming paranoid.

(2) Those given electric shocks to the head are suffering from intense headache, memory lapses, incoordination of thought and action, visual disturbances and are having various weird symptoms.

(3) Those who are physically tortured, specially those who are kicked, trampled upon or beaten with blunt lathis are having severe muscle and joint pains; blood vomiting; passage of black-coloured stool or melaena; passage of blood in urine; inability to use one or more arms, forearms, fingers, legs, etc; and damaged reflexes and other neurological features.

(4) Those who have been tortured in genitalia are developing loss of libido, impotence and other sexual abnormalities.

"The greatest tragedy possibly is that all these tortures are interrogations of innocent people and are mainly pointless and fruitless. They have not helped the armed forces either to make any spectacular arrests or achieve a major breakthrough but have served to make the population sullen, rebellious and more alienated—a perfect recipe for future violence".

Over 300 names have been mentioned and description has been given of the method of torture.

According to the Amnesty International report called 'Torture, Rape and Deaths in Custody' of 1992:

"Torture is pervasive and a daily routine in every one of India's 25 states, irrespective of whether arrests are made by the police, the paramilitary forces or the army. It happens regardless of the political persuasion of the party in power. Many hundreds, if not thousands, have died because of torture during the last decade.

"Many torture victims are arrested in connection with criminal investigations and tortured to extract information and confessions. Others are arrested because of a relative or friend sought by the police or because false charges are brought against them at the behest of powerful local interests, members of state ruling parties, businessmen or landowners. This is particularly commmon in states in which there is organised opposition to economic exploitation such as Bihar, where the police appear often to act as instrument of repression on behalf of local ruling groups.

"Torture is also widespread in areas where the government faces armed opposition—Jammu and Kashmir, Punjab, Assam and the north-eastern states and the regions of central India where the Naxals are active. Here, torture is the means of obtaining confessions and gathering intelligence but it has an extra dimension: it is also used as deterrent and in reprisal for attacks by armed groups.

"The most common torture methods are severe beatings, sometimes while the victim is lying upside down, and electric shocks. People have also been crushed with heavy rollers, burned, stabbed with sharp instruments, and had objects such as chillies or thick sticks forced into their rectums. Sexual mutilation has been reported.

"Rape is a common form of torture. It is so routine that a 1988 newspaper headline read: 'Another mass rape by Bihar cops'. In September 1989, the Rajasthan state government admitted that the police had been involved in over 50 rapes in the past few years. According to the Delhi police, 14 cases of rape were reported involving 20 police officers at 12 police stations between January 1 and February 11, 1990. Rape of women appears to be used by the police and the security forces to deter opposition and also as a means of indirectly punishing the men from a particular village or area. As an editorial in *The Statesman* commented: 'The police abuse women to carry out a proxy war against what their menfolk stand for'.

"Successive Indian governments have persistently refused to investigate the abuses documented in such reports and have frequently sought to discredit their authors. Some civil liberties activists have been detained because of their work.

"Journalists who expose human rights violations have also been detained and ill-treated. Threats against journalists and assaults on them are frequently reported. In July 1989, Bramhadeo Singh Sharma, 84-year-old editor of *Awaaz-a-Hind* newspaper in Bihar, was dragged from his house by police and forced to remain standing for several hours. This occurred after he wrote an editorial condemning the police administration for failing to punish officers who had publicly stripped and beaten unconscious Malati Manjhiyan, a tribal teenage girl. He was released following protests by journalists and others. The seven police officers responsible, including the senior officer, were suspended but no further action is known to have been taken against them.

"The government's persistent failure to acknowledge that torture is routine serves to ensure that the established pattern of its practice throughout India will continue.

"At the end of 1970s, police in Bihar, faced with a steep rise in armed robbery carried out by gangs of young men, decided to blind suspects as a deterrent to others. Over 30 men and boys were deliberately blinded with thick needles and acid between October 1979 and November 1980. The youngest victim was 16 years old.

"The man who had been instrumental in exposing the blindings was the superintendent of Bhagalpur jail. He was suspended without pay in December 1980.

"The first inquiry was carried out by the deputy inspector general of the Bihar Criminal Investigation Department (CID). He was ordered to go to Bhagalpur to establish whether the police had carried out the blindings. He later said: 'I was given the

job because they knew that I had a great weakness for the police force and they expected me to cover up. I went thinking that the police could never be guilty of such brutality, but after examining the victims for two days I got 32 cases instituted against 10 police officers'. When his superiors received his first report, he alleged, his inquiries were promptly blocked. Nevertheless, he submitted a 70-page report to the Bihar government in December 1980, followed in January 1981 by separate reports on each case. In February 1981 he was told to vacate his office by the following day and was demoted.

"The police blidings in Bhagalpur illustrate key aspects of the pattern of torture in India: the sanction of torture by state and local judicial authorities, the routine concealment of torture, the failure to conduct proper inquiries, and the inordinate length of judicial proceedings. It was 10 years after the blindings that the Supreme Court quashed the charges against the victims. However, the case is exceptional because a nationwide public outcry resulted in concern at the highest level of government and the prosecution and punishment of at least some of those responsible. Nevertheless, several of the police officers allegedly involved apparently escaped trial and the longest sentence served by a police officer convicted of deliberately blinding a prisoner was three years.

"Criminal suspects form a large proportion of India's torture victims. Many victims of torture are jobless, slum-dwellers or migrant labourers who have come to the cities in search of work. Most victims of police rape in Delhi, for example, are migrant women, who often disappear after the rape because they are too frightened to pursue the matter.

"There is also a pattern of torture and ill-treatment in punitive reprisals for resistance to police or military operations. In many Indian states the police have been accused of detaining and torturing people on false charges at the behest of influential local interests.

"Dalits and adivasis are frequently tortured for political reasons, to deter them or punish them for involvement in organised resistance to economic exploitation. Often adivasi and dalit villages have been raided and their inhabitants tortured and raped by police acting in collusion with local ruling groups, such as landowners. Such abuses are common in Bihar.

"In May 1988, 23 women from Majhua village of Purnea district were raped by police during a raid on the village reportedly instigated by a local contractor as part of an attempt to intimidate villagers who had refused to work for less than the minimum wage. The police were armed and reportedly responded to any resistance with violence. The rape victims were said to include an 80-year old woman, and a baby girl, aged one, was reportedly molested.

"In June 1991, the PUDR published a report of its investigation of police behaviour in the tribal village of Hadmatiya in Udaipur district of Rajasthan. In March 1990, according to this report, a local large landowner had lodged a complaint of trespass and theft against 37 villagers after they attempted to grow crops in a tank bed to which they held traditional rights. The complaint was investigated by 11 police officers who visited the village on March 5, and reportedly provoked a riot by mistreating adivasi women. Several police officers were beaten. The police withdrew and filed charges of assault and attempted murder against the villagers. Some four weeks later, they also took direct reprisals. According to the PUDR, 14 jeeps, four trucks and a bus load of police officers accompanied by some of the landowners' agents, surrounded the village and herded the villagers into a field. They then opened fire on the villagers injuring 35. The women were stripped and beaten.

"Torture is common in those areas where there are political groups actively seeking independence or increased autonomy, especially when such demands are made by armed opposition groups. These groups are active particularly in Jammu and Kashmir, Punjab and the north-eastern states.

"It is impossible to gauge the true extent of torture in Jammu and Kashmir. In July 1991, unofficial sources estimated that 15,000 people wete being detained without trial in the state. Many of those detained since late 1989 have alleged after release that they were tortured and ill-treated in custody. In November 1991, Kazi Massrat, the chief casualty officer at the Medical College Hospital, Srinagar, told a British journalist: 'I must have treated 250 torture victims in the last year'. He said they included men who had been forced to drink large quantities of fluid after having their penises tied tightly. Earlier in June 1990, recently released villagers from the village of Haihama-Payerpora, Kupwara district, told another British journalist how they had been tortured while detained by the Indian army. When interviewed they still bore massive bruises, burns from electrodes and heated rod cuts and rope sores. One man, whose feet were bandaged up to the ankles, said a bed of coal had been covered with corrugated iron and a deep layer of sand which slowed their progress when the prisoners were forced to run across it. All had been released without charge after soldiers reportedly threatened to detain and torture them again if they should support the armed opposition.

"In Jammu and Kashmir, rape is practised as part of a systematic attempt to humiliate and intimidate the local population during the counter-insurgency operations.

"In May 1990, Mubina Gani, a teenage bride, was detained at roadblock and raped by BSF soldiers on her way from the marriage ceremony to her husband's home. Her aunt who was seven months pregnant was also raped. The official explanation was that the wedding party had been caught in crossfire between two paramilitary units. The victims said that soldiers had fired on them without warning at the roadblock, killing one man and wounding several others before raping the two women.

"Mubina Gani told one reporter: 'we were crying bitterly. I told them I had not yet seen my husband. But they did not listen. Four to six persons raped me, I think.

"This incident, when it was reported, captured the attention of both the Indian and international press. As a result an inquiry was instigated by the police, and a report from one senior officer confirmed that the rape had occurred. However, those responsible have not been brought to justice.

"The PUDR also published a report on Assam in May 1991. It concluded: 'Most of the persons detained by the army were tortured... We have interviewed many tortured victims, visited three hospitals, met concerned doctors and gone through a number of court documents

"Beating, stripping and hanging them upside down and then beating on head and chest, thumping on chests with boots, pouring ice cold water, burying them up to chest and then beating on keeping a bucket over the head, squeezing testicles with clamps, dipping in cold water drums, forcibly keeping them awake for days together, denial of food or water, are some of the forms of torture used. But the most common form is electric shocks. Sensitive parts of the body including ears, tongue, armpits, genitals and head were repeatedly given electric shocks sometimes in progressively higher voltages. With electrodes at each temple the brain was subjected to electric waves.

"Rape and ill-treatment of Bodo women by the police and the security forces have also been widely reported. Rape often occurs during the raids on villages in search of tribal militants.

"The use of torture in Punjab has been officially confirmed. A judicial investigation was conducted in February 1989 by justice S S Sodhi in Amritsar jail. He found that many detainees had been tortured by police when kept in illegal detention preceding formal arrest."

In spite of this widespread torture all over India, the government of India never seriously considered as to how to contain this inhuman crime against humanity.

"In response to the 33 specific allegations of torture and deaths in custody, raised by the United Nations Special Rapporteur on Torture between 1988 and the end of 1990, the Indian government either denied them—saying that they were concocted; provided the police version of events; said the allegations were under investigation—or failed to give any response even when the allegation had been confirmed in court. Typical is the response India's representative gave to the

42nd session of the UN sub-commission on prevention of discrimination and protection of minorities on August 27, 1990. "The law in India forbids a police officer to use more than the minimum force required to deal with a particular situation. The government has issued directives to police personnel to desist from such methods during investigation and interrogation which can cause torture. In India an entire network of safeguards within a democratic system are available to prevent the occurrence of human rights violations such as the torture of detainees These safeguards include a completely free press, public awareness and the institutions of a vibrant and healthy democracy. Despite such safeguards, a few isolated cases of torture of detainees can take place as they can elsewhere in the world. Whenever allegations of torture are made even in the press, there is a regular investigation by a judicial magistrate and if anyone is found remiss in his duty, proper action is taken. Police personnel found guilty of torturing detainees are liable to receive exemplary punishment."

Is the torture, then, legal?

Can confessions be extracted by torture and produced before a court of law as evidence?

Are, the courts of law going to accept such confessions as evidence of guilt?

APDR in its report narrated: "It may be noted that causing hurt to the arrested persons under police custody, not to speak of public flogging, is not only impermissible, but also a penal offence under Sections 330 and 331 of IPC. Section 29 of the Police Act of 1881 and Article 20(3) of the Constitution of India clearly forbid such course of action. Rule 3 of the Police Code of Conduct lays down: 'They (the police) should not usurp the functions of judiciary and sit in judgment on cases. Nor should they avenge individuals and punish the accused'. Because Section 101 of Indian Evidence Act clearly stipulates that the arrested person has the right to have the benefit of the presumption of innocence till his guilt is proved. Several Supreme Court judgments have upheld the spirit of this Act."

Under Article 21 of the Constitution, every one in this country has a right to live with dignity. But, unfortunately, Article 22, Clause 2(3) (b) and Clause 2(4) of the Constitution give power to the parliament to pass draconian legislations and successive governments from 1950 have passed anti-people legislations like PD Act, MISA, NSA, ESMA and TADA, with the help of which all the governments without exception have ruthlessly suppressed people's aspirations. This immense power has been misused by the politicians, with the help of the police, on a massive scale The constitutional protection has become, because of these legislations, more illusory than real for the people for whom it was particularly meant, i e, the have-nots, the dalits, the oppressed classes, which comprise nearly one-half of the population of India

In no civilised country, the confession of an accused will be accepted in a court of law—a confession which has been made before a police officer. But, unfortunately, in this country in some cases such confessions are accepted in a court of law. Read in this connection, Section 8 of the Railway Property (Unlawful Possession) Act, 1966. Qua this section the Supreme Court said in 1981: "Officer of Railway Protection Force making inquiry in respect of an offence under Section 3 of the Act is not a 'police officer' within the meaning of Section 25 of the Evidence Act and, therefore, any confessional or incriminating statement recorded by him, in the course of an inquiry under this Act, cannot be excluded from evidence under the said Section".

Under Railway Protection Force Act, 1957, Section 14, such power is there. Taking cue from these two earlier acts, in the Terrorist and Disruptive Activities (Prevention) Act, 1987, Section 15, the power has been given to a police officer not below the rank of an SP to extract confession from an accused and use it in a court of law." TADA is the most atrocious of all the preventive detention legislations and if such power is given to a police officer, then, god help this nation and its citizens. A contemporarian entry in the jail hospital of Tihar jail was brought to the notice of the Supreme Court by a prisoner called Sunil Batra and the jail hospital register reads:

"One prisoner, Prem Chand s/o of Prahlad has developed tear of anus due to forced insertion of stick by someone. He requires surgical repair and his bleeding has not stopped. He has to go to Irwin Hospital immediately.

This entry in the jail hospital register roused the conscience of the Supreme Court and the Supreme Court said in no uncertain terms that the prisoners do not lose their precious fundamental rights guaranteed to them under the Constitution even inside the jail. "Whether inside prison or outside the prison a person shall not be deprived of his guaranteed freedom save by methods right, just and fair. The court has a continuing responsibility to ensure that the constitutional purpose of the deprivation is not denied by the prison administration."

Justice Douglas of American Supreme Court was quoted with approval when he said: "Prisoners are still 'persons' entitled to all constitutional rights unless their liberty has been constitutionally curtailed by procedures that satisfy all the requirements of due process." The Supreme Court said; "Perhaps the most important right of a prisoner is to the integrity of his physical person and mental personality."

In respect of the constitutional and administrative aspects of the prison justice, the Supreme Court gave the following guidelines.

"(1) It is imperative, as implicit in Article 21, that life or liberty, shall not be

kept in suspended animation or congealed into animal existence without the freshening flow of fair procedure. Fair procedure in dealing with the prisoners calls for another dimension of access to law-provision, within easy reach, of the law, which limits liberty to persons who are prevented from moving out of prison gates.

"(2) No prisoner can be personally subjected to deprivations not necessitated by the fact of incarceration and the sentence of court. All other freedoms belong to him—to read and write, to exercise and recreation, to meditation and chant, to creative comforts like protection from extreme cold and heat, to freedom from indignities like compulsory nudity, forced sodomy and other unbearable vulgarity.

"(3) Inflictions may take many protean forms, apart from physical assaults. Pushing the prisoner into a solitary cell, denial of a necessary amenity, and more dreadful sometimes, transfer to a distant prison where visits or society of friends or relations may be snapped, allotment of degrading labour, assigning him to a desperate or tough gang and the like, may be punitive in effect. Every such affication or abridgement is an infraction of liberty or life in its wider sense and cannot be sustained unless Article 21 is satisfied. There must be a corrective legal procedure, fair and reasonable and effective. Such infraction will be arbitrary under Article 14 if it is dependent on unguided discretion; unreasonable, under Article 19 if it is irremediable and unappealable; and unfair, under Article 21 if it violates natural justice.

"Likewise, no personal harm, whether by way of punishment or otherwise shall be suffered by a prisoner without affording a preventive, or in specific cases, *post facto* remedy before an impartial, competent, available agency.

"(4) The prison authority has duty to give effect to the court sentence (Sections 15 and 16 of the Prisoners Act 1900). To give effect to the sentence means that it is illegal to exceed it and so it follows that a prison official who goes beyond mere imprisonment or deprivation of locomotion and assaults or otherwise compels the doing of things not covered by the sentence acts in violation of Article 19. Punishments of rigorous imprisonment oblige the inmates to do hard labour, nor harsh labour. 'Hard Labour' in Section 53 Prisons Act has to receive a humane meaning. So a vindictive officer victimising a prisoner by forcing on him particularly harsh and degrading jobs, violates the law's mandate...

"(5) Violation of provisions of Section 27(2) and (3) regarding separation of prisoners must be visited with judicial correction and punishment of the jail staff. Sex excesses and exploitative labour are the vices adolescents are subjected to by adults. The young inmates must be separated and freed from exploitation by adults. Violation of these imperatives will attract Article 19.

"(6) Any harsh isolation from society by long, lonely, cellular detention is penal and so must be inflicted only consistently with fair procedure, Provisions of Section 29 and connected rules in this regard enunciated in the previous Batra case must be complied with...

"(7) The state shall take steps to keep up to the Standard Minimum Rules for Treatment of Prisoners recommended by the United Nations, especially those relating to work and wages, treatment with dignity, community contact and correctional strategies.

"(8) The Prisons Act needs rehabilitation and the Prison Manual total overhaul, even the Model Manual being out of focus with healing goals. A correctional-cum-orientation course is necessitous for the prison staff inculcating the constitutional values, therapeutic approaches and tension-free management.

"(9) The prisoners' rights shall be protected by the court by its writ jurisdiction plus contempt power."

In Prem Shankar Shukla vs Delhi Administration 1980(3) SCC 526 qua Handcuff, the court pronounced:

"To handcuff is to hoop harshly and to punish humiliatingly. It is necessarily implicit in Articles 14 and 19 that when there is no compulsive need to fetter a persons's limbs, it is sadistic, capricious, despotic and demoralising to humble a man by manacling him. The minimal freedom of movement, which even a detainee is entitled to under Article 19, cannot be cut down by application of handcuffs.

"To be consistent with Articles 14 and 19 handcuffs must be the last refuge as there are other ways for ensuring security. No prisoner shall be handcuffed or fettered routinely or merely for the convenience of the custodian or escort. Functional compulsions of security must reach that dismal degree where no alternative will work except manacles. There must be material sufficiently stringent to satisfy a reasonable mind that there is clear and present danger of escape of the prisoner who is being transported by breaking out of the police control and further that by adding to the escort party or other strategy, he cannot be kept under control. The onus of proof in this regard is on him who puts the person under irons.

"Merely because a person is charged with grave or serious offences the inference of escape proneness or desperate character does not follow and, therefore, on that premise alone he cannot be handcuffed."

Therefore, it is evident that constitutionally and legally there is no scope of torture of a citizen in this country—whether he is within the confines of a prison or not.

The government of India has subscribed to the Charter of the United Nations, 1950, which clearly says:

"Everyone has a right to life, liberty and security of person.

"No one shall be subjected to torture or to cruel, or degrading treatment or punishment.

"No one shall be subjected to arbitrary arrest, detention or exile."

The government of India has entered into a number of international covenants related to the right not to be subjected to torture and cruel, inhuman and degrading treatment or punishment.

In 1979, India ratified the International Covenant on Civil and Political Rights which, under Article 7, prohibits acts of torture and of cruel, inhuman or degrading treatment or punishment, a prohibition which exists even in times of "public emergency which threatens the life of the nation" (Article 4). On June 23, 1979, the government of India deposited with the United Nations a unilateral declaration against torture, in which the government stated it would comply with the rules for the prohibition of torture laid down in the declaration on the protection of all persons from being subjected to torture and other forms of cruel inhuman or degrading treatment, or punishment and implement its provisions through legislative and other effective measures. However, the government stated that it reserved the right not to pay compensation to victims of torture. The text of the Unilateral Declaration reads:

"The government of India hereby declares its intention:

(a) To comply with the Declaration on the protection of all persons from being subjected to torture and other cruel, inhuman or degrading treatment or punishment (General Assembly Resolution 3452 (XXX) annex);

(b) To implement through legislation and other effective measures, the provisions of the said Declarations.

"The government of India further declares that it reserves the right not to apply the principle contained in Article 11 of the Declaration insofar as it concerns the payment of compensation by the state against torture or similar offences committed by or at the instigation of public officials."

India took repeated initiatives urging other member states of the United Nations to make such a Unilateral Declaration on Tortures which its representative to the United Nations described, in 1979, as "a commitment by a government on behalf of its citizens", and "a guarantee for these citizens which they could claim whenever their rights were threatened."

But in spite of India having a wonderful constitution and having officially committed to the Charters and Covenants of the United Nations, violation of human rights in its myriad forms is going on. One cannot even see the dim gray light at the end of tunnel.

But, then, as Will Durant said: "It is time for all good men to come to the aid of their party, whose name is civilisation".

Triple Talaq: Posturing at Women's Expense

Gautam Navlakha

While supporting the recent Tilhari judgment, the left and feminist groups should take care to expose the pseudo-champions of Muslim women's rights who remain silent about the plight of Hindu women

THERE is an apparent similarity between the Supreme Court judgment of 1985 granting maintenance to Shah Bano and justice Tilhari's judgment of April last declaring recitation of 'talaq' thrice at one sitting or during one 'tuhar' (menstruation period) as unconstitutional

The reservation about the Tilhari judgment is not whether a judge under transfer can take up such a case, or that the judge exceeded the jurisdiction by looking into the mode of divorce in a case which had to do with Urban Land Ceiling Act The issue that is of interest is that justice Tilhari who pronounced such a momentous judgment is the same judge who delivered the infamous judgment which allowed darshan at the spot where communal-fascists of the RSS had demolished the Babri masjid and had then gone on to construct a make-shift temple This judgment was based on the specious plea that Ram is a "constitutional entity" since his photograph was there in a copy of the constitution bequeathed to justice Tilhari by his father[1] One is also surprised because justice Tilhari has not shied away from describing himself as a "Hindu nationalist" Thus a judge who declares customary practice of talaq as unconstitutional but had no hesitation in validating a criminal act of demolition as constitutional cannot escape public scrutiny Therefore, if someone is sceptical about the judgment it should not cause surprise, rather it should raise the question whether the judgment was predicated on the assumption that Muslim orthodox leadership would react in a predictable way and the secular lobby would be compelled to support the judgment This is what has happened There is no doubt that Muslim women suffer due to the ease with which Muslim men divorce their wives It is also true that countries such as Pakistan, Syria, Algeria, Libya, etc, have outlawed talaq through one sitting Nevertheless, we cannot help raise the issue whether the support for the judgment is based on ground of women's rights or whether it is based on the communal argument of Muslim obduracy and backwardness Ludicrous as it may sound, this is the crux of the issue since no Indian can remain indifferent to the question of motivation after December 6, 1992 Many who support the need for reform by shedding crocodile tears about the plight of divorced Muslim women are the very same people who sealed their lips when Muslim women were being raped and killed in the name of Hindu resurgence in December 1992 and January 1993 So, to say that this issue is irrelevant is to adopt a convenient posture Convenient because it gives the appearance of being neutral and equi-distance between various forms of communalism and patriarchy without in fact being so Indeed, the appalling ignorance of Indian progressives and reactionaries about the infirmities of the Hindu personal code and its anti-women character compares with their knowledge about the Muslim personal code and its shortcomings

Does this mean that Muslim women should continue to suffer because of the communal-fascist threat? And is one implying that since the motives of several champions of Muslim women's rights are suspect, one should not support any reform lest it further alienate an aggrieved community? Actually, one is merely stressing the need for being consistent and learning from the mistakes made in 1985-86 by supporters of Shah Bano Let us recall that the left and feminist groups then confined their campaigning to Muslim women This skewed their project, since in the name of not diluting the parliamentary and non-parliamentary opposition the protagonists did nothing to project their fundamental differences with the communal-fascists nor did they expose the hypocrisy of the pseudo-champions of Muslim women One would have expected that in the light of developments since then these women's right activists would devote at least some energy to highlighting the weaknesses of other personal codes But events following Tilhari judgment do not reveal them to be much familiar with Indian social reality It is as though they are either too timid to voice the demand for the need to reform the Hindu Code Bill or continue to believe that the Hindu personal code has been reformed to a point that not much by way of protecting women's rights is required On both counts, the situation calls for urgent review Let us not forget that the Hindu Code Bill of 1956 was a much diluted version of the original draft and that even the act has been changed over the years through judicial pronouncements and parliamentary amendments to the detriment of women What is more, there is an in-built bias in the code in favour of Hindu men with clear economic and social benefits accruing to them as against women

It is time that those who support Muslim women's right educate themselves about other personal codes and put forward a concrete set of demands for reform in all personal codes thereby exposing the communal-fascists and their fellow-travellers who are wont to adopt convenient positions This alone is the way in which communal polarisation can be avoided and instead one between protagonists and opponents of women's rights can be brought about Those who gloat at the predicament of the Muslim liberals must be pushed to define their position *vis-a-vis* the plight of the Hindu women, something most Indians very conveniently like to gloss over Or else we are condemned to relive the hypocritical campaign on behalf of Muslim women as it happened in 1986, which became the guise for the appeasement of the communal-fascists through the opening of Babri masjid

The G7: Spectre of Job Destruction

Frederic F Clairmont

Big Capital's policies of labour exterminism reduces the market that capitalists need to realise their profits, even as corporate investment is hamstrung by the prevalence of unused industrial capacity. At the same time, spending by the capitalist state is inhibited by the uncontrolled growth of the national debt. These are three interrelated facets of the global capitalist crisis and the contradictions inherent within it.

THE two-day jamboree on unemployment in Detroit by the world's seven leading capitalist countries is now over. The chairman of the meeting struck the right chord. "We want the unemployed to understand that they must not have high expectations about this meeting. It is nothing more than an exchange of ideas." The ruling class message is very clear.

For a politically beleaguered Clinton harassed by alarming trade imbalances it was a vulgar public relations stunt to exhibit his ostensible compassion for the plight of the unemployed. The G7 talk show coincided, however, with the tragic announcement by Second Harvest, the largest US Food Bank, that one in 10 Americans, or an estimated 26 million people, rely on charitable food agencies to eat. Most of these are desperate families driven into the ranks of the destitute, the hungry and the homeless by joblessness.

That in a country that unceasingly proclaims itself the richest country in the world and leader of the free world; that in a country in which Clinton and his cronies were blasting China for their alleged flouting of human rights. Forget the ballyhoo and the empty moralisms of your irrepressible corrupt administration just for a while.

What we want to know Clinton is where are the human rights of these tens of millions of marginalised working peoples in your country, and those struggling on the poverty line, and even the middle classes, that have been junked by capitalism into the garbage can of history? Could you not have the sense of decency to cut the double-talk about human rights?

It was symbolic that this unemployment bull session was held in Detroit, once the proud capital of America's auto industry; a showcase to the world of US industrial capitalism. Today, Detroit is a smelly and polluted Industrial wasteland, a landscape of unbearable urban desolation, its rotting buildings, its uncollected garbage, where a pervasive mood of utter hopelessness and desperation prevails; Detroit encapsulates the moribund nature of US capitalism in its most pathological manifestations.

Robert Reich, US secretary of labour, hastened to add apologetically that one-third the adults in Detroit are unemployed; indeed, the unofficial figure is much higher. Never mind. What he was too embarrassed to say was that it has by far the highest crime rate in the US, second only, at a world level, to Rio de Janeiro.

Driving Down Price of Labour

What the supreme political spokesmen of Big Capital in Detroit could not say—understandably the very word capitalism was not even mentioned in their palaverings—was that unemployment is not an aberration of the capitalist system, rather it is inherent in the very workings of capitalism whose core is capital accumulation That is savings, investment, profits and the propertied class relations that dominate and determine the system's trajectory.

In the fallacious conception of mainstream economics, unemployment is mandatory so that inflationary pressures are dampened; in the perception of the capitalist in all phases of capitalism's development unemployment is deemed an imperative to maintain 'flexibility' in the labour market. What 'flexibility' demands is the creation of a reserve army of labour; that is not simply a supply of labour to meet a given demand of labour, but rather an oversupply of the commodity labour power. In short, a situation in which labour competes against labour to drive down the price of labour, i e, wages, the income of the working class.

A common theme now heard with increasing clamour by corporate impresarios and their political hatchetmen is the need to break the Welfare System and all its works. That is called injecting the dynamic of flexibility. Dismantling the Welfare State and the gains that flow from it is now one of the prime targets of Big Capital This, of course, has always been the case in capitalism's history, but in certain phases of the business cycle the demands are more muted.

Unemployment has now hit levels unprecedented since the Great Depression. The so-called cyclical upswings or bouts of prosperity have not appreciably reduced the jobless ranks. Around one quarter of the Spanish workforce is unemployed. It matters little whether the hegemonic political force in power is Social Democrat (as was in France), Monetarist or Keynesian. The end result is the same. Capitalism's crisis, of which unemployment is one of its grimmest traits, has not altered the functioning of the system. The idle chatter of People's Capitalism and the Affluent Society have now vanished.

Corporate 'restructuring' or 'downsizing', to use the current jargon, was a major theme of the G7 talk show. The drive 'to restore competitiveness' so vigorously touted in Detroit, and through every media outlet that the bourgeoisie has grabbed, has already wiped out tens of thousands of jobs, with tens of thousands more to follow. Since 1991, 9,00,000 jobs have been eliminated in Germany, in 1994, another 4,50,000 jobs will be liquidated. This will boost German joblessness to around 12 per cent of the workforce. It is in this context that one sees the relentless drive of capitalists and their state machinery to pursue the class struggle everywhere against labour at any costs, and with no holds barred.

Massive Rise in Unemployment

The dogmatists of Big Capital are on the rampage Listen to one of the ideologists of the Economic Gulag, the German ambassador in Rome, Konrad Seitz: "I have no doubt", he pontificates, "that 'restructuring' will work, thus making Europe's industry more competitive". Now the clincher: "the price is clear: big cuts in the labour force and a massive rise in unemployment are called for". He goes on to contend "that for German industry to reach top productivity levels, it would have to consider superfluous something like 38 per cent of the labour force". Obviously not included in this horrendous exterminatory number is his immediate coterie, his family and himself. This ejaculation must not be misconstrued as the rantings of a madman. He is not simply juggling with numbers.

He is a political gauleiter of Big Capital in much the same way as his SS precursors were. In his class, and in the G7 as a whole, that kind of crocodile logic has become commonplace. It ought not to be forgotten that it was precisely the substance and shadow of that logic that drove the German Confederation of Employers to bankroll the likes of Adolf Hitler which ensured the success of his power grab in January 1933.

Likewise, Carlo de Benedetti, chairman of Italy's Olivetti, boasts that he slashed in three years his workforce from 60,000 to 38,000 and "I can assure you that I'am not at the end of my road". His prescription is banal: lower production sites overseas, notably in Bangladesh and Vietnam, whose political leaders advertise themselves as the possessors of the world's cheapest labour power; battling the Welfare State head on. This includes hammering the unions and demolishing or drastically cutting non-wage contributions, that amount to about 30 per cent of total labour costs.

By 1995, the number of jobless Europeans is expected to hit over 20 million, about a quarter of them between 18 and 25 years of age. The chairman of France's employers' confederation, Francois Perogot, now laments: "We are living beyond our means. We have lost our technological edge. We are not prepared for the future, or for international competition". By now this is an old tune that tries to retain its youthfulness by being repeated again and again. In short, the cause of capitalist crisis is the working class.

Even with an elementary knowledge of the conditions of the French working class can one genuinely say that it is 'living beyond its means'? How can one make such a blatantly mendacious statement when the evidence overwhelmingly indicates that the French working class and the youth are victimised by endemic unemployment, wage cuts and collapsing living standards? Trade unionists and other political activists are being hounded out of the factory floors.

Living beyond one's means? And what of the monstrous and exponentially rising social inequalities that have mushroomed in France over the last two decades, specifically under the Mitterrandist 'socialist' regime? Obviously this is not exclusively a French capitalist phenomenon: it is the relentless application of IMF/World Bank structural adjustment policies, uninhibited liberalisation, deregulation, privatisation and the scuttling of the public sector, wedded to the psychology of corporate greed and acquisitiveness.

Capitalist mouthpieces of the above cited breed are surely not oblivious of the horrendous levels of unrestrained capital concentration that is taking place in the world economy? The shallowness, and viciousness, of Big Capital's ideological offensive does not choose to define what 'living beyond one's means' is. A reminder is necessary.

Let us look briefly at the world's top 200 corporations, that is the profile of what we have designated as the 'Global Economic Gulag'. Their total sales have soared from about $3 bn in 1982, to over $5.8 bn in 1992; their share of global GDP climbed from 24.2 to 26.8 per cent. This was occurring at a time when the world capitalist economy was in the doldrums.

The Transnational Corporation (TNC), in particular, has become one of the major job liquidators in capitalism's history. For Big Capital such liquidations are the Grand Celebration. This mass liquidation of working peoples by corporate capital is being done notwithstanding their Himalayan heights of profitability. This is the rationale of the bottom line.

Changing Nature of Work

The golden decade of capitalist growth in the 20th century lasted about two decades: 1955-1975. Since then the world capitalist economy has crawled into a phase of relative stagnation. One of the essential by-products of the current capitalist crisis has been a huge shift in the nature of the work process.

This is marked by the fragmentation of the workforce. Conventional unemployment in manufacturing and service sectors is being replaced at an accelerated tempo by part-time non-unionised labour. For the capitalist, such institutional devices yield prodigious profits: labour costs are no longer part of fixed personnel charges; vacations and health insurance costs are non-existent. Labour can be hired and fired at will. In all OECD economies such labour recruitment strategies have become generalised.

Liquidation of permanent employees not only introduces flexibility and curbs costs, but no less important is that it provides for a higher degree of socio-political control over the labour force. What we are seeing is the coexistence of a rising number of precarious part-time workers and a cutback in permanent employees.

Such labour fragmentation is matched by the practice of keeping wages well below gains in productivity. Gains in labour productivity has never been equitably shared with workers. The system is not engineered for this purpose. Fidel Ramos, Philippine strongman, delivered the message straight on in an address to industrialists: "I don't want to hear talk of wages and productivity gains going hand in hand. What makes sense is that wage costs must be kept in check. Grasp this point well for it is the price of your survival and means for enhancing our international competitive capabilities." That in a poverty-stricken country with one of the lowest industrial wages in the world.

What Ramos as a compradore politico has frankly acknowledged is precisely what has occurred in the OECD group of countries over the last 15 years. The drive to boost productivity means extracting a greater and greater actual economic surplus, that is net profit, from a smaller and smaller defenceless workforce employed at stagnant or falling real wages.

Productivity which is output per worker depends on how much can be produced by the capitalist with a given unit of labour. Productivity is therefore the rate of exploitation of the working class. The classic and oldest way of exploiting labour has been the lengthening of the working day; the second, without lengthening the working day, is to speed up the work tempo; the third, the introduction of labour-saving techniques with automation the highest expression. As Frederick Winslow Taylor, the father of rationalisation at the turn of the century noted, all three are interdependent.

In her significant analysis of labour time in the US [*The Overworked American: The Unexpected Decline of Leisure Time*] Juliet Schor of Harvard indicated that the average US worker in 1987 laboured 163 hours longer per year than in 1969. In less than two decades a full month of labour per year had been added matched by a similar deduction of leisure time.

The world has felt the brunt of Japan's conquest of world markets. Certainly robots and industrial organisation have played their part, but more important has been the savage exploitation of the Japanese worker. There has never been any 'miracle' in Japan. What there has been is a state of sustained super-exploitation. In 1987, Japan's industrial workers sweated out 2,168 hours a year, compared to 1,949 for US workers. The miracle is explicable in terms of blood, sweat and raw muscle toiling for the nation's Big Capital.

Summing up the impact of falling real wages in the US Schor writes:

> In return for a 1970s standard of living, employers are now demanding far more hours. For the production and non-supervisory employees who make up 80 per cent of the labour force, these demands have been substantial. According to our calculations, just to reach their 1973 standard of living, they must work 245 hours more, or six-plus extra weeks a year.

It is palpable to whom the gains of productivity go. What is frequently lost sight of in the current debate on unemployment and productivity is that when total output is stationary any rise in labour productivity boosts unemployment. To claim that boosting productivity is the key to recovery as Clinton did in Detroit is merely to ignore that global industrial output is now around 65-70 per cent of capacity.

Failure to work at full capacity cannot be imputable to a decline in worker productivity. The fundamental of fundamentals facing capitalism, the supreme challenge is not boosting productivity but chronic overproduction. Here the contradiction of the system comes into full play.

Inherent Contradictions

One of the consequences of restructuring has been mass, sustained unemployment and the nosedive in real wages. Under these conditions is it surprising that this has led everywhere to a dramatic fall in labour's share of the gross domestic product, and a parallel rise in the share of profits? The battering of labour by the heavy artillery of Thatcher and Reagan—they are not alone—has yielded a giant bonanza to capital. In the short and medium term that will, however, and indeed already has proved self-destructive.

Do the architects of these strategies believe that the labour holocaust on such a massive and continuing scale will solve the problem of overproduction, or under-consumption which is the other side of the coin? The evidence points to one implacable conclusion: Big Capital's policies of labour exterminism will reduce the market that capitalists need to realise their profits.

This is so because consumption which represents 60-65 per cent of GDP in OECD countries has been slashed by soaring unemployment, chronic indebtedness and collapsing real wages. Likewise, corporate investment is hamstrung not by a shortage of capital (there is no such thing) but by the prevalence of unused industrial capacity. In what manufacturing sectors should capitalists invest? And who is going to buy their goods? Superimposed on these woes is that spending by the capitalist state is also inhibited by the uncontrolled growth of the national debt.

These are three interrelated facets of the global capitalist crisis and the contradictions inherent within it. Distressingly, there are no prospects of any changes on the horizon that would alleviate the sufferings of the victims of capitalist exploitation.

Redirected Anger: 'Loving Thy Enemy'

Peggy Mohan

Redirected anger is anger that brings violence to people for whom this aggression is not specifically intended If we look at the totality of violence around us, we see that most acts of aggression are, ultimately, expressions of redirected anger

You live alone Right now you walk alone in an anonymous night where the happy people sleep safe and sound By day you work hard faceless in a world full of insult and humiliation you are powerless to confront or avenge You swallow it and store it and watch your anger grow big and bright And you wait Wait for now As you walk in darkness you look for someone someone you do not know someone whose weakness and helplessness will make you whole again And now she walks into your sights already scared in the loneliness of the empty street Your anger glows to meet her and your strength becomes infinite You can rape So the anger passes on

VIOLENCE you might say was the earliest form of capital!

Long before there ever existed such a thing as money to distil and store wealth and achievement, man had already discovered that the safest way to deal with impotent rage was to extricate it from its original context and store it to use against an even more helpless victim, a victim incapable of any real retaliation Since forever frustrated individuals have sought out weaker individuals to vent their anger upon, and created complex chains of redirected violence that extend down-down down

The boss is tense and angry with the board of directors, but you cannot shout at them So the boss shouts at the assistant The assistant dare not argue back, and takes out the frustration on the typist And the typist takes it out on the peon The peon goes home and beats his wife And the cowed wife gets her own back by abusing the poor daughter-in-law The chain may end in suicide, the victim-aggressor directing the violence back upon himself, or herself It is not for nothing that the suicide rate drops drastically in times of war, or that societies handle pent-up anger by being either murder prone, or suicide-prone!

Redirected anger is anger that brings violence to people for whom this aggression is not specifically intended If we look at the totality of the violence around us, we see that most acts of aggression are, ultimately, expressions of redirected anger wife-battering, child battering cruelty to daughter in laws rape humiliation of subordinates, cruelty to animals mugging destruction of property communal violence suicide 'Superficial causes are usually referred to when such incidents are being reported riots are related to political protest, rapes to sex muggings to theft but beneath the surface there often lurks the deeper cause—the need to redirect unbearable frustrations that have been weighing on the attackers in their daily lives' (Morris *Manwatching*, Triad Panther Books 1978)

Some anger of course, is not redirected Anger between equals is usually easy to resolve and dispel What is less easy to resolve directly is anger between the unequal Redirected anger is an anger of hierarchy something ultimately very social The point is that complex social structures automatically store and redirect frustration towards those who are weaker The point, also is that the resulting violence is ahistorical being nothing more than a redirection of a very present day frustration it cannot in all honesty, be explained away as any sort of redressal against those who might have done us wrong in a past we never saw

A Suitable Victim

Formal relationships, even formal relationships of redirected violence, tend to want to settle on a single ideal match

So it is not surprising that the list of attributes desirable in a victim-mate reads rather like the list of attributes sought in a mail-order bride The male-female colouration is inescapable An ideal victim-mate should be big enough to do you credit, maybe even to attempt to fight back thereby giving you grounds for attack, but never big enough to seriously threaten you Your wife must do you credit, but never outshine you And she must be different from you physically by dint of being female So, too, a targeted ethnic minority should be large enough to be taken seriously as an opponent but never large enough to actually win in a conflict And you should be able to point to some congenital feature of 'difference between the two of you

The very best victim mate should also be one you find beautiful', for as anyone ever complimented on being beautiful' can tell you to be beautiful is to be 'secretarial' in the male world of power the compliment is actually a dismissal A woman can only be beautiful' when her face is expressionless, dependent and unconcerned with power And a language, and a culture are beautiful' if all that is left to them is the expression of emotional outbursts of poetry, or the 'sweet sounds of the subsistence economy The languages of the men who create high technology and the global economic order are not 'beautiful' at all they are serious

The victim-mate as a beautiful woman' who is a credit to your good taste! The recipient of redirected violence as a 'stranger' to the first conflict that brought the hate! The arranged marriage quality of the relationship is an eerie clue that the thing we are seeing before us is not hate at all but a twisted form of love! The kind of 'love' that makes any independent woman s blood run cold

Emasculation or Extinction

A bare twenty five thousand years ago, during the late Pleistocene Epoch that followed the Ice Age, there lived on this planet two species of human Cro-Magnon man, our ancestor and Neanderthal man By all accounts, both species were highly evolved social creatures with language systems and the rudiments of tool making technology

Twenty-five thousand years later, in the rationalist humanist world of the late 20th century where the last of the tigers and whales are still to be found planet Earth is home to only one species of human us

The problem with Neanderthal man, it seems, was not that he was too much of an animal to share space with us We have tolerated the presence of animals in our midst even to this day The problem with Neanderthal man seems to have been that he was all too human, and our early ancestors must have unleashed upon him the full might of their insecurity, frustration and cruelty And now, they are all gone Gone, like the vanished worlds of the Inca, the Carib, the Mayan, the Aztec, the Algonquin nations To walk the heights of Macchu Picchu is to

look on the graveyard of all those whose presence would have warmed our lives, and the life of planet Earth And to feel immeasurably ashamed, and sad

For those condemned by man there is but one escape The wolf opted for it, and became man's best friend, the faithful dog, and our love for him knew no bounds Domestication The ability to acknowledge man's superiority and to surrender yourself to his protection And man's closest competitor the human female, also accepted terms of truce She was not in quite as much danger of extinction as Neanderthal man, simply because she alone could be mother to mankind's children But even so, woman has always been in a position to pose a real alternative to the regime of power violence-inequality designed and administered by man But, being physically weaker she cannot win in an out and-out contest based on raw power, but neither can she be eliminated So the final arrangement formalises the regime of power-violence-inequality and leaves her secure in a subordinate niche And, the better she adjusts to this niche, the more the conflict will metamorphose into that perversion the poets call love!

The choice before the victim-mate is clear to insist on remaining 'masculine' and adversarial is to invite continuous conflict which could only end in extermination To agree to being 'colonised' 'domesticated' that would bring not just an end to the conflict, but maybe even a secure, constricting marital 'love' Communal aggression from the dominant group met by direct 'masculine'-style retaliation results in 'ethnic cleansing' Threat met by ritualised submission merely establishes a power-hierarchy and strengthens a route for a redirected violence that only serves to perpetuate the superstructure of inequality

'Above' the Battlefield

It stands to reason, if you believe that others are 'less' than you, if you basically accept the idea of inequality, that you simply cannot then exclude the possibility of there being some 'other' to whom you yourself must feel unequal The smug White visa-officer at the American embassy or the British high commission, born to the privilege of dumping on the Browns and the Blacks of this world and making them squirm, becomes all of a sudden a flustered sycophant when faced with a foreign feudal White presence And he in turn squirms embarrassed at his own 'ordinariness' Somewhere somehow, the big bad brute who has so much anger to redirect our way 'knows' that he is 'weak', and that he lives by the grace of some towering other

Our big bad macho is only somebody else's 'little woman'! And this is what makes him so bullishly mad!

So it should come as no surprise, as we look inside the psyche of our own dominant group, here in India, that we find an insecurity bordering on utter despair at life in the shadow of the successful western world—now known as the 'New Global Order'. Not long ago, before our men 'opened up' to the appetites of western man, we lived in a pleasant cocoon, snug in the 'knowledge' of our own importance and independence. And we lived, more or less in peace. Our very first 'pogrom' against an ethnic minority, the Sikhs, coincided exactly with the start of the regime that formalised the flirtation with 'opening up', in end-October 1984. And shortly after, it was found 'necessary' to redirect tension back at another 'beautiful' minority who refused to align with us unequivocally, and Kashmir was 'opened up' as an outlet for mainstream anger. And now we have graduated to a 'suitable victim'—the Indian Muslim. It should give Indian Muslims a grisly satisfaction to consider that they are, as a 'victim', proportional in size and importance to the emasculating threat of the big western world!

The scenario is actually quite nauseating. An Indian trader class forced to agree to a relationship with the west that is merely a more sophisticated, escape-proof means of colonisation. Executives of multinational companies who must agree to salaries one-tenth of those offered to the White boys back home. But both are grateful, and both hide their frustration as they strut before the general public. No one, any more, has the guts to rail against the White man in the west, who has turned our men into 'toy-boys'. Shhh! You will not get your green card! Be 'pragmatic'! In other words, swallow your anger, and go home and 'beat' your 'wife'. And who could be a more creditable, more 'beautiful' 'wife' than the Indian Muslim, the one who actually once brought you to your knees? It is all 'her' fault! And, as any woman can tell you, the most atavistically cruel beast upon the planet, seething with frustration at his own smallness and sense of failure even as he struts about spinning illusion, is the 'toy-boy'.

There are some among us who have expressed surpirse at the quantum of 'comfortable' yuppies who have suddenly turned anti-Muslim, railing against the 'pampering' of a minority group. What, you ask, could poor Muslims possibly be in a position to deprive them of? And how could they—who have the most beautiful women dancing attendance on them without a whisper of the quid pro quo of marriage—how could they object to Muslim man's legal right to acquire the extra woman or so?

Well, the answer is crystal-clear: it is our yuppy, and no-one else, who is close to the source of all the frustration: homo-erectus from the new wild west! 'Manhood' demands that if 'our' Muslims are to be pampered, we must be the ones to do it! Muslims must have no independent access to rights. And God forbid they should insist on projecting, in their man-woman behaviour, a 'masculine' image. Urdu, ghazals, soppy romance, veils, deferential manners: these are all very nice: *Pakeeza* was every bigot's favourite film. But it is only a short while ago that their armies of men made us into vassals, and, what with this new threat from an even further 'North-West', we have not yet recovered our confidence. Like the celebrated Michael Jackson, with his delicate, sculpted face, anorexic adolescent body, pale skin, flowing hair and explosion of provocative movement, minority man becomes acceptable only when he sheds his old sexual image, and tries to become like our women.

World-Without-End

We pause, now, on the terrifying thought that all the redirected misery we see was foreordained from the moment, thirty-five thousand years ago, when our prehistoric ancestors began to compete for the ownership of this planet Competitors in stasis, like Neanderthal man, had lost the inertia and the initiative in the contest, and, too close to 'humanity' for comfort, had to be eliminated. The Inca Empire broke, too, when it would not bend: in the single year that followed its conquest by the Spanish explorers, 90 per cent of its population was exterminated, and absolutely all of its leadership. The few surviving examples of the race are now resolutely Christian, retain no direct memories of the old order, and are resigned to a life of poverty.

It would serve many a puny short-sighted purpose if we simply gave up right now and concluded that this joyless and increasingly tense and exclusive set-up had the power of inevitability on its side. Certainly, for it to change, for tension and inequality to vanish, all our notions of order would have to be hopelessly disrupted.

But there are other natural laws about us, larger, much larger than the patterns of small incremental change within 'closed' systems we know, laws that tell of large systems faced with life-threatening crisis taking 'bifurcations'. Dying. Giving birth to new and different systems. Changing trajectory altogether. That is where the 'outsiders', the 'subordinate' ones, the 'females', in art as in life, have had a major role to play as a gene-bank of the imagination. In the words of one old Quechua Indian of Peru, face to face with two travellers from modern India: "thank you, for still being alive". Alive to offer the softer but more durable options disdained by the world of power-violence-inequality. Alive to talk of strange and wondrous things like nurture, and love, as forces that might make a world go round. Alive to dream of an end to insecurity, frustration and loneliness in a world full of equals.

There is an apocalyptic vision in Hinduism itself, more potent than the shrill sight of hordes of frustrated, excluded men attacking with pickaxes three lime-plaster breasts pointed up serenely into the Ayodhya sky. And it is the vision of the Earth Mother herself, awakening one day in pain and despair at the way her sons have used her bounty. In a flash, she knows what she must do. Taking upon herself the terrible aspect of the Ugra-Chandi, red in tooth and claw, she calls forth her attribute of destructive power, and as the Black Mother strides forth upon her planet to destroy and destroy and destroy until, in the clear light that follows the storm, the Earth itself stands cleansed, cleansed of an old order that had mocked at her journey of change, renewal and love.

What irks our Goddess most sorely is the way men, silly self-serving men, have sought to present her to the world as 'wealth': bland, disassociated, plunderable, accumulated 'capital', severing her living link with the source of all her bounty, the Earth. Because Earth knows, in her infinite and ageless wisdom, that disassociation and abstraction are only a hoax played on man by his conscious mind, and that ultimately, in a larger life-cycle, man lives only by her grace. That debts will ultimately have to be repaid, sins atoned for, and balance restored. And she knows, with grim amusement, that the more frenzied and outrageous man's attempts are to formalise this world of imbalance and inequality, the faster will come the storms and the blessed rains of apocalypse.

An old crone sits beside the scene of unspeakable carnage, at the end of Lorca's pulsatingly beautiful drama-poem, ***Blood Wedding***, where the tension is finally gone, and balance restored. Who did it, this last and final destruction, where the men of 'honour' have all killed each other, and now lie dead? Who performed the grisly sacrifice of appeasement that brought a beautiful city to its knees, and humanity face to face with what it was beginning to become? We must not know, we cannot know. It is better that way.

The 'men' are dead and gone, and it is morning again. It is time to look to the living.

'It is the fault of the Earth', she agrees.

Social Movements: What's 'New'?

Rohini Hensman

New Social Movements in the South edited by Ponna Wignaraja; Sage Publications, New Delhi, 1993; pp 276, Rs 275.

THIS book suffers from a lack of definition of its subject matter. In his introductory essay, Ponna Wignaraja says that "There is a qualitative difference between the new people's struggles and earlier liberation movements against colonialism, the peasant movements for land reform, and trade union movements" (p 6). The chapter does not "presuppose that the new macro and micro social processes in the South are homogeneous and monolithic. But it will attempt to identify several positive elements in the changes in social formations, consciousness and organisations that are beginning to emerge on the ground" (p 5). The implication here is that the new social movements are the modern successors to earlier liberatory movements. However, he points out in a note that "Not all new social movements are positive. Some, like the movements arising from the cruder compulsions of religious fundamentalism, are left out of my analysis" (p 33). There is a chapter on 'Ethnicity and Separatist Movements in South-East Asia' and another on 'The Palestinian Social Movement', both describing attempts to form new nation-states, and it is not at all clear how these are substantially different from earlier liberation movements. Yet another chapter is about Swadhyaya, a modern version of earlier Indian bhakti (devotional) movements, which "is not directed towards modifying or changing social institutional arrangements" (p 184); "the organisational structure of Swadhyaya resembles that of a joint family" (p 193), which in India is a notoriously patriarchal and authoritarian institution. So, what's 'new'?

It is additionally argued that the failure of "the two dominant frameworks of thinking and action—both borrowed", i e, Marxism and neoclassicism, to "set in motion processes of social change in the South" (p 4) requires that "Several fundamental values which existed in traditional societies must be identified and re-examined. Some critical values relate to looking at life in its totality and all its richness; participation of the people in decisions that affected their lives; sharing and caring for the community beyond individual self-interest; trust, innocence, simplicity, thrift; a work ethic with a fine-tuned balance between work and leisure; harmony with nature and a rational use of resources; communal ownership of the commons; and complementarity between men and women" (p 20). While it is certainly necessary to be critical of existing "frameworks of thinking and action", this is not achieved by wrongly identifying Marxism with state capitalism and concluding that it has "basic similarities" with private capitalism and neo-classical theory (p 13). On the other hand, while there are certainly *elements* of traditional culture which could usefully be preserved, nothing is gained by idealising it *as a whole*. Barbaric practices such as untouchability and 'sati' (widow immolation), both of which involve treating whole sections of society as less than human, denying them dignity or control over their own lives, hardly fit in with the idyllic picture of 'traditional societies' described above. (Unless perhaps, 'complementarity between men and women' means 'dominant men, submissive women', 'husband dies, wife must die', etc, and one really believes that the people treated as untouchables participated in the decision which made them into outcasts of society!)

Fortunately—and this is the strength of the book—there is a diversity in the contributions which allows for alternative points of view to emerge. For example, Leilah Landim, in her chapter entitled 'Brazilian Crossroads', describes a more complex relationship with traditional culture, involving tension between "the values of citizens, individualism, autonomy and equality on the one hand, and values of membership, holism, hierarchy and complementarity on the other. Our journey with the grass roots of society has brought us to walk a tightrope that establishes commitments between innovating and conserving, transforming and respecting, overcoming and redeeming" (p 218). Samir Amin, in his chapter on 'Social Movements at the Periphery', describes the relationship thus: "The refusal to accept and to grasp the universal dimension of culture which the real internationalisation initiated by capitalism has already imposed..., this refusal and withdrawal into a negative culturalist nationalism (simply anti-western —and often neurotic) do not constitute the possible yeast for an effective response. At the other extreme, western-type alienation, which definitively separates one from popular reality, is also a dead end" (p 98). These two extremes often feed on each other, the destruction of communities by capitalism and western individualism producing a backlash in the form of oppressive and sectarian religious revivalist and ethnic nationalist movements. An alternative to both—one which respects individual human and democratic rights while simultaneously affirming values of community and solidarity—could perhaps be seen as a legitimate goal of genuinely 'new' social movements.

Another major point of dispute which emerges from the contributions is the role of the state. Despite his plea for cultural universalism, Samir Amin's main line of argument

> is built around the observation that the unequal development immanent in capitalist expansion has placed on the agenda of history another type of revolution, that of the peoples (i e, not specific classes) of the periphery. This revolution is anti-capitalist in the sense that it is against capitalist development as it actually exists because it is intolerable for these peoples. But that does not mean that these anti-capitalist revolutions are socialist. The state here fulfils specific functions. It is the means of national protection and self-assertion, that is, the instrument of what we have called delinking, in the sense of the subordination of external relations to the logic of an internal development (which is not simply capitalist) (pp 83-86).

This argument makes the role of the state central to the progressive social movements which are envisaged for the future. Most of the other contributors, on the contrary, would question whether the state can any longer play such a role, even if it was at one time capable of doing so. For example, Rajni Kothari says,

> It is now clear that expectations of such a role of the state, and the presumed alliance between the state and the masses in such an expectation, have been belied. Today the state is seen to have betrayed the masses, as having become the prisoner of the dominant classes and their transnational patrons, and as having increasingly turned anti-people (pp 62-64).

Here is perhaps where we come to the crux of any useful distinction between 'old' and 'new' social movements, if we are to avoid trivial distinctions, such as defining as 'new' any movements which are currently active, or alternatively defining as 'old' any movements which have been around for a while. The 'old' movements can be identified as those which in one way or another see the achievement of state power as essential to the process of social transformation they seek to bring about; even where they see the *existing* state as the target of attack, their goal is still the creation of their own state. The 'new' movements, on the contrary, have no such goal; even though they might seek to put pressure on the existing state to accede to their demands, or prefer one form of state

over another, the oppressed groups which give rise to these movements would not see the actual control of state power as contributing to their goal of achieving greater control over their own lives and destinies. Their struggles are directed against the *multifarious* relationships of oppression which abound in third world societies, often in a piecemeal and spontaneous fashion, while they might lack the discipline and unity of purpose of the old movements, they are also less likely to fall into the trap of reproducing in a different form the very same unequal power relationships they are fighting against. As Harsh Sethi puts it, "Dominance is exercised by a web of interlocking structures, including many not recognised as political... Rarely is it realised that unless part of the new societal vision is translated into actual reality in the course of the struggle itself, we are likely to end up with a societal formation similar to Khomeini's Iran... Continuing old social practices necessarily gives rise over time to old social relations" (p 250).

Paradoxically, although the focus on the capture of state power is seen by most of the contributors as being a feature of 'Marxist' practice, the new social movements have much in common with the reclaiming of decision-making by working people from the state advocated by Marx in his writings on the Paris Commune. This may be why Daniel Comacho, in perhaps the most relevant chapter entitled 'Latin America: A Society in Motion', says that "When it comes to an analysis of the kingdom on earth, Marxism enriched by concepts and words from different cultures and ideologies has no rival" (p 39). According to him,

> In Latin America today...the ideas of socialism and of working class rule are used less commonly than the ideas of a struggle for revolutionary democracy and for the hegemony of the working people. Revolution is put forward as a simultaneous liberation from both imperialism and the local oligarchic bourgeoisie; but there is no talk of liberation from imperialism without liberation from the local oligarchic bourgeoisie, or of liberation or revolution in order directly to achieve socialism. Democracy with 'people power' is the great objective (pp 36-37).

I feel this defines the agenda of the new social movements very well: neither the nationalist 'people's revolution' that Samir Amin advocates, nor the establishment of a 'socialist' state, but a gradual extension of the democratic space in which ordinary working people can deliberate over, make decisions about, and take action on matters which intimately concern them. Comacho gives examples which illustrate the great diversity of these movements: the indigenous movement in Guatemala, struggling against the expropriation of their land and genocide of their people by the state; the urban popular movements in Mexico, demanding not only "the right to housing and the use of barren land", but also "defence of civil liberties, democratisation of daily life and organisation of production co-operatives" (p 46); the neighbourhood movement in Lima, which organised popular kitchens, the Glass of Milk Programme for children, popular libraries and health teams; and the mothers' clubs in Sao Paulo, which initiated a movement against the high cost of living and "mobilised 20,000 people—in the midst of a dictatorship—in a street demonstration which remained a landmark in the struggle for democracy" (p 47). While the feminist content of the women's movements is not emphasised here, it is clear from other accounts that in Chile, for example, women saw a link between male authoritarianism in private life and state authoritarianism in the form of the Pinochet dictatorship and fought against both simultaneously.

These are only a few examples out of a vast and rich array of movements taking place throughout the third world. A few of these are described elsewhere in the book: for example, the Chipco movement, "a classic example of non-violent resistance and struggle by thousands of ordinary hill folk" fighting to "save the local forest resources from commercial exploitation by outside contractors" (p 127); the movement against the Narmada Valley project, a gigantic scheme consisting of more than 3,000 major and minor dams" which, according to estimates, "will displace nearly one million people on completion" (p 133); and struggles of traditional fisherfolk against over-fishing by trawlers in shallow waters, which not only deprives them of their livelihood but causes the decimation of young fish and disruption of breeding cycles, possibly leading to the ultimate disappearance of the fish. (All these examples are from the chapter on 'Ecological Struggles in India' by Harsh Sethi.) However, it is disappointing that there are so few case studies of actual movements, and large parts of the 'south' are completely missing from the picture (e g, east and south-east Asia, most of Africa).

Comacho includes the workers' movement as an important element in the new social movements, noting that "the involvement of the working classes in popular struggles in Latin America implies that these struggles adopt a more global and radical vision... In Chile, Bolivia and Brazil, the participation of the industrial working classes in the struggles for democracy was unquestionable... In Latin America... the industrial working class does not constitute the entirety of the proletariat. But the development of its organisation in industrial branches increases its range of action to agriculture, the mining industry, services, etc... In Brazil, within a different context and with different origins, we also find a working class which goes further than simple trade union demands" (p 53).

This brings us to the question of whether the trade union or labour movement should be excluded from the definition of 'new social movements'. It is true that some trade unions are affiliated to and controlled by parties in power or aspiring to take power, or may function in a manner which is far from democratic. But I feel this is not a sufficient reason for writing off the entire movement as being incapable of expressing the democratic aspirations of working people. Throughout the third world, not only in urban but even in some rural areas, workers fight—sometimes to the death—to establish unions, because this is the only means they

have to avoid total domination by employers This is not simply a struggle for money but above all for dignity, and trade union rights are correctly considered to be an essential part of democratic rights Moreover, the activities of trade unions in third world countries are not necessarily confined to wage bargaining, but may be quite varied and innovative For example the Self Employed Women's Association (SEWA), which was registered as a trade union in 1972, has fought for higher wages social security, protective legislation and other benefits for women who work as bidi rollers garment workers, tobacco processors, hand cart pullers and contract labourers, it has helped women to form and run artisan land based livestock trading and service co-operatives, and it runs a co-operative bank, community health programme child care centres legal aid service, housing services literacy classes and video workshops The Chhattisgarh Mazdoor Shramik Sangh, formed in 1977 is another union which has taken up a wide variety of issues, including mechanisation health care, children's recreation and education, and even alcoholism There seems to be no logical reason why such organisations should not be seen as part of the new social movements

In fact, when we look at the issue more closely it becomes clear that what is 'new' is not the social movements themselves struggles against multifarious forms of oppression have existed from time immemorial What is new is the *framework* which locates these movements as part of a process of revolutionary social transformation In many of the older frameworks as we noted earlier, capture of state power is the essential element this can be achieved by a neat, centralised movement with an easily identified and glorious climax Even in the non-statist Marxist framework, oppression and liberation are defined solely in class terms and other types of oppression—of women, ethnic and religious minorities, etc—is downplayed less neat and centralised than the statist model, but still relatively simple In the new model on the other hand, *all* struggles seeking to abolish oppressive, authoritarian relationships, whether they are based on class, gender, caste, religion, ethnicity or anything else, are seen as part of a process of revolutionary social transformation It has to be said that these movements often suffer from the same problem of one dimensionality—for example, resistance to racist or religious persecution which ignores gender and class oppression women's liberation struggles which ignore class and communal oppression and so forth Hence a framework which recognises them all as making a necessary contribution towards creating a non oppressive anti authoritarian society would need to bring to each movement a wider vision which encompasses the aspirations of all the others, and at a practical level seek to build links of solidarity and co-operation between different movements, not only within each country but also internationally No doubt the model which results is chaotic, messy, confusing, lacking in a clear, simple focus on an identifiable moment of glory, but is there any other way of changing a reality which is likewise chaotic, messy, complex and multi-dimensional?

Women's Work

Prem Chowdhry

Filling the Rice Bowl: Women in Paddy Cultivation by K Saradamoni, Sangam Books, New Delhi, 1991, pp X + 138, price not stated

SARADAMONI's book would have been highly relevant if published shortly after its data collection was over, which was more than a decade ago Eighties were the years when the proposed aim of the book— the ignored aspects of women's life—their work and contribution to home and society" —was being hotly contested and debated Challenges were being thrown to the officially and popularly perceived definitions of women s work and the male-centric way the census authorities and official data collecting government agencies were operating which refused to take any cognisance of women's economic contribution, specially in the rural sector The questioning of this highly prejudiced criterion led to a series of focused studies on the sexual division of labour, differential wage structures lack of evaluation or devaluation of women's work, etc, all of which have succeeded in turning women more visible' in academia Increasing numbers of studies are now on their way to greater sophisticated analysis and conceptualisation of women's work in myriad of spheres ranging from economic, socio-political and the domestic

The time lapse in publishing this work earlier has therefore eroded the new perspective' which the author claims to offer to its readers in remoulding their understanding of women's role in economy and society For the purposes of this review we therefore wish to highlight certain aspects which, although given minor space and attention by the author still make this work worthwhile reading

Chapter VI (pp 84-106), 'Life and Work Profiles of Women', takes the case studies of 18 women across the three paddy-growing regions of Kerala, Tamil Nadu and West Bengal The respondents are both from the landowning and labour households Some of these case studies are profoundly moving profiles in courage and survival by women against extremely heavy odds A number of these cases may be aptly bracketted under the single women category which encompasses widows deserted divorced and unmarried women of different ages These single women head their households, cater to their immediate or extended families which depend in many cases on their single income in the face of severe unemployment, underemployment and low/discriminatory wages Those with male support of husband or son/sons are hardly better off The primary source of income which sustains the family in an agricultural labour household remains that of the woman The man maintains his own priorities in expenditure which eat away not only his income but depletes that of the woman as well

The inclusion of women from landowning households introduces an interesting dimension to the case studies and throws up certain points of similarities and differences across caste class and community, which may be picked up for further investigation The recent changes in agriculture have meant a greater utilisation of women's work from landowning families within the patriarchal structure, which accepts her changed role, accommodates her in spheres unheard of before, yet affords her no control over decision or income and maintains the same power equations as before The one case which projects different gender equations and stands in isolation, belongs to an agricultural household of Tamil Nadu where an illiterate woman by virtue of her political stand and participation testifies to an entirely different pattern of gender relationship

These thought-provoking studies, all too brief, could well provide the nucleus of an extended indepth work with a set of entirely different questions being posed Also interesting is the perception and observations of women respondents regarding unemployment, alternative employment and avenues of income, education, health, family planning, politicisation of agricultural workers, benefits of organised union activity, etc All these may be further picked up to gain insight into existing rural problems, the hollowness of government claims, the lopsided priorities adopted in poverty alleviation programmes and areas of acute and potential deprivation which require urgent intervention, both private and state In fact what is important in Saradamoni's work is not so much what she says as what she leaves unsaid and unexplored She scores in germinating ideas for future work in women/gender/development and social studies which may be fruitfully taken up by other researchers

Conflict and Compromise

Devolution and Disposal of Property in a Matrilineal Muslim Society

Leela Dube

History provides examples of societies that come to accept two sets of rules simultaneously, both being viewed as sacrosanct: those subsumed in traditional customary law and derived essentially from kinship, and those subsumed in the legal codes of their new faiths. The inhabitants of the Lakshadweep group of coral islands present a fascinating instance of this kind.

The people of Lakshadweep have followed matriliny under the rubric of Islam. As a consequence their conceptions of rights relating to property and its actual distribution have been governed by customary law upholding matrilineal principles along with an application of rules deriving their sanction from Quranic injunctions and the sharia.

Focusing on the process of devolution and disposal of property in Kalpeni, one of the 10 inhabited islands of the Lakshadweep group, this study presents situations in which parts of two legal systems were used at different points in the same disputes or in which there was simultaneous use of elements of both systems.

RIVALRIES and disputes over property within the kinship universe are a ubiquitous feature of human social life. Rules relating to rights over property are rooted in specific kinship systems and are neither unambiguous nor inflexible. Often such rights are negotiable. The ambiguity in rules and the multiplicity of norms that govern choice, as well as the complexities of events and circumstances, leave room for individuals and kin groups to pursue their interests in diverse ways. Rules, norms and behaviour all seem amenable to different interpretations and to reinterpretation. This is especially evident in societies that function under systems of customary law. The situation is further complicated if, along with the rules subsumed under its customary law, a society comes under the influence of another legal system. There have been instances of colonial powers trying to impose their legal systems on the populations under their rule. At other times they have interpreted indigenous systems in the light of concepts and rules derived from their own legal systems.

History also provides examples of societies that come to accept two sets of rules simultaneously, both being viewed as sacrosanct: those subsumed in traditional customary law and derived essentially from kinship, and those subsumed in the legal codes of their new faiths. The inhabitants of the Lakshadweep (Laccadive) group of coral islands in the Arabian Sea off the south-western coast of India present a fascinating instance of this kind. They have followed matriliny under the rubric of Islam. As a consequence their conceptions of rights relating to property and its actual distribution have been governed by customary law upholding matrilineal principles along with an application of rules deriving their sanction from Quranic injunctions and the *sharia*.[1]

In this essay I shall focus my attention on the process of devolution and disposal of property on Kalpeni island. It is based on a scrutiny of documents registered in the Amin's court from 1881 to 1966, detailed accounts of the movement of the property of some *taravads* (matrilineal descent groups), and a study of some court cases. Recent changes in the administrative set up of the island have been ignored.

This study presents situations in which parts of two legal systems were used at different points in the same disputes or in which there was simultaneous use of elements of both systems. Transactions relating to property and disputes arising from them involved persuasion, cajolery, the putting forth of counter claims, manoeuvring, the formation of alignments and realignments, and the play of power in the arena of justice. What is most interesting, however, is the selective invocation of norms and values emanating from two sources: matriliny and Islam.

After a brief ethnographic account of the island of Kalpeni I shall spell out the nature and character of property and also the broad rules and processes that govern transactions in it. This is followed by a presentation of two complex cases of transactions in property and the attendant disputes and their resolution. In the concluding section an attempt is made to analyse the interplay of values and norms, rules and processes, interests and emotions.

II

Kalpeni is one of the 10 inhabited islands of the Lakshadweep group. Its inhabitants are Sunni Muslims who follow the Shafi'i school of Islamic law. They have been included in the list of scheduled tribes by the government of India. Barring the distant island of Minicoy, which is ethnically and culturally closer to the Maldives, the inhabitants of all the islands are descendants of Hindu settlers from the Kerala coast. According to historical and linguistic evidence the major migrations possibly occurred in the 9th and 10th centuries AD.[2] After about four centuries there was an *en masse* conversion to Islam brought about by Arab traders. Hinduism was thus displaced by Islam, but the special form of matriliny which the migrants had brought and which had become entrenched because of favourable ecological conditions has survived to this day [Dube 1969, 1978; Kutty 1972; Ittaman 1976; Saigal 1990].

The islands produced only coconut, fish, some fruits, coarse grains and vegetables. Coir making has been the principal industry and the coconut has been the basis of the economy. The islands have all along sustained themselves through trade with the mainland, from where they have got those necessities that they did not themselves produce. The islanders thus owe to the mainland their cultural heritage, including language, and have always depended on it for their staple food, rice.

The islands seem to have been under the authority of one or other ruler from the mainland, although dependable historical evidence is available only for events after the 15th century. At the beginning of the 16th century these islands were transferred from the Hindu Raja of Chirakkal to the Arakkal rulers of Cannanore, who were Muslims. During Arakkal rule the islands were administered by *karyakars*, agents of the ruler, assisted by a few *mokhyastans*, *karnavars* or important people from the islands. The Amindive group was treated as one unit. It passed into the hands of the

British from Tipu Sultan of Mysore at the end of the 18th century. For the Laccadive group there was a century-long struggle between the Arakkal rulers and the British. From 1875 the islands of this group effectively remained in the hands of the British, being finally taken over by them in 1905. From 1877 each of these four islands had an Amin appointed by the government from among the *karnavars* or elders who represented important *taravads*. The *karnavars* assisted the Amin in the administration of justice. This group of islands was attached to the district of Malabar.

The coir monopoly, introduced in 1764-65 during Arakkal rule, was the main source of revenue for the government. Tree tax was levied on *pandaram* or government land. The coir depots established on the islands around 1922 provided for the supply of rice in exchange for coir at exchange rates fixed by the government from time to time.

Kalpeni, situated about 220 km south-west of Kozhikode (Calicut), is about three miles long and three quarters of a mile broad at its widest. There are five uninhabited islets to its south-west and a larger one to its north. A lagoon encloses this small group within a ring reef and provides excellent facilities for fishing. Kalpeni and adjacent islands are covered with coconut trees, with breadfruit trees forming a distant second as vegetation.

Cultivated edibles included papaya, plantain, yam, sweet potato, ragi, maize and beans. The growing of betel vines was also popular. Coconut trees supplied the raw materials for both coir and copra, the principal industries. From coconut toddy were made vinegar and jaggery, which had a good market on the mainland. Fishing was an important activity on Kalpeni, but the catch was essentially for home consumption.

In 1962 the population of Kalpeni was 2,920.[4] One significant feature of these islands has been the presence of three or four caste-like groups which are interdependent, hierarchically graded, exclusive and exhaustive. Tradition traces their descent to the Nayar, Nambudiri, Mukuvan and Tiya castes of Kerala. Kalpeni's population was divided into three groups: the Koya, who were traditionally landlords and boat owners; the Malmi, navigators; and the Melacheri, coconut pluckers and toddy tappers. The Koya formed over half of the population and the Melacheri over a third. The major economic relationship, that between *keyi* (master) and *tandelan* (servant) was between the Koya and the Melacheri. Particular Koya *taravads* or their segments were linked to Melacheri households in service relationships. Besides plucking coconuts and tapping toddy, the *tandelan* rendered services and assistance in various activities including copra-making, fishing, the building of boats and houses, coir-making, voyages to the mainland, and rituals and ceremonies. Their remuneration was mostly in kind.

Relations between groups were traditionally marked by discrimination, social distance, and various kinds of disabilities which were akin to those traditional in Kerala but without notions of ritual purity and pollution. During British rule, particularly in this century, the Melacheri successfully fought for the removal of disabilities and discrimination. Gradually they also came to acquire some land. The three groups have continued, however, to remain separate and distinct, with endogamous marriage as the norm as well as the practice. Instances of hypergamy could be counted on one's fingers.[5]

The island had 22 mosques and two schools for religious education. A high school and also a primary school for girls had been opened by the government.

The local administration of the island was in the hands of the Amin, who was assisted by members of the island's council of elders. In the 1960s this consisted of the *karnavars* of 24 *taravads*, of whom 16 were traditionally recognised Koya *taravads*.[6] Appellate jurisdiction for Kalpeni lay in the district of Malabar. During the periodic visits of the inspecting officer appeals were heard and cases decided with the help of the elders.

Descent was traced through the mother: female links alone were recognised for membership of a matrilineal group and for a right to its resources. The traditional pattern of marital residence was duolocal, the husband being a nightly visitor to his wife's house. Children lived with their mother and her matrilineal kin.[7] Thus the elementary or nuclear family, either as an independent unit or embedded in a larger kinship unit, was not institutionalised.

Marriage always began with a visiting pattern. In the early 1960s, of 670 married men 515 were visiting husbands; 124 lived uxorilocally; 23 lived neolocally; and the wives of eight had moved to live with them [Kutty 1972]. Uxorilocal residence was adopted only after a marriage had acquired stability. Divorce and remarriage were common.[8]

One's social identity was derived from one's *taravad*, whose name was used as a prefix to one's personal name. A *taravad* was a group of individuals, of both sexes, who could trace their descent in the female line from a common female ancestor. The depth of this matrilineage could vary from three to six generations. It was birth in a *taravad*, a matrilineal exogamous descent group, which gave an individual an inalienable right to a share in its property.

A *taravad* was not always an economic unit that owned property in common and organised production and other economic activities in common. It might form a property group operating as one production and consumption unit, it might be a production unit that comprised more than one consumption unit, or it might have split into a number of property groups, each of which was made up of one or more consumption units (Diagrams 1 to 4).[9] The splits in a *taravad* or a lower level matrilineal unit tended to run along *tavazhi* or branch lines.[10]

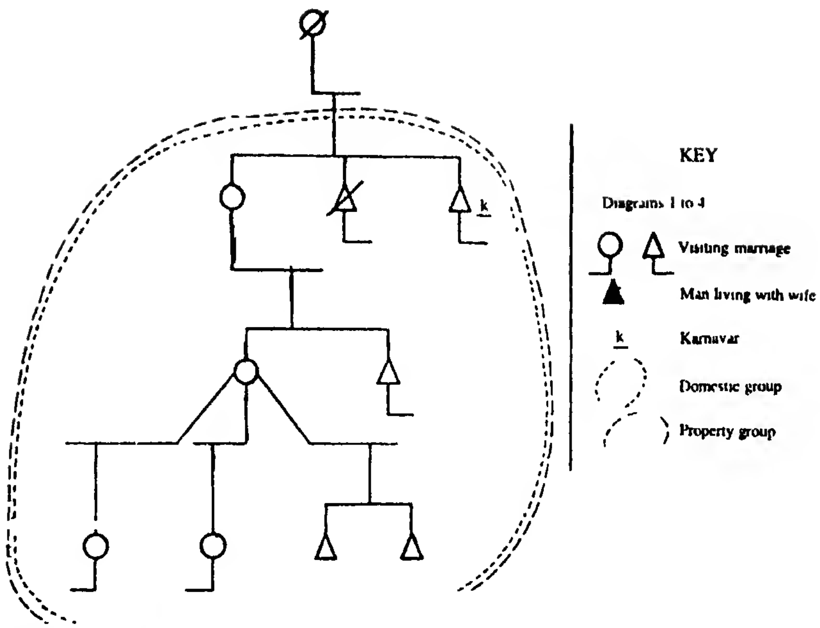
Along with the other islands, Kalpeni had no codified law. It only had customary law, which laid considerable emphasis on precedents. This was referred to as *parampara* (tradition), and in reference to matrilineal property and inter-group and interpersonal relations within the kinship universe was specified as *marumakkatayam*, which is the term used for the matrilineal system among both Hindus and Muslims on the south-western coast of India.

Marriage and divorce were regulated by the *sharia*, specifically by the Shafi'i school of law. The *sharia* also provided guidance for the other crises of life such as birth, circumcision and death. But aspects of marriage, divorce and life-cycle rituals were also governed by tradition. The Kazi (who was usually his *taravad*'s representative on the island council) was expected to deal with all marriages and divorces. In instances of discord and quarrels he often held meetings to negotiate and attempt reconciliation with the help of elders. Issues pertaining to the settlement of dues between husband and wife or other matters relating to property arising out of divorce could be referred to the island council. All matrilineal property disputes and transactions relating to the disposal of individually owned property, which was viewed as being governed by the *sharia*, was either settled through negotiation or dealt with by the council.

In connection with the matrilineal Minangkabau of West Sumatra, Nikki Keddie (1987: 19) speaks of Islam being considered classically to consist of two parts: *ibadat*, worship, which includes the 'five pillars of Islam'; and *mu'amlat*, transactions, which covers the great majority of questions regarding this world that are dealt with in law and jurisprudence.[11] Keddie holds that the Islam of the Minangkabau was primarily one of *ibadat*. The distinction between *ibadat* and *mu'amlat* appears to be relevant for understanding the process in which arguments and counter-arguments are put forth during property transactions, matrilineal values are repeatedly reasserted, and limited use is made of the *sharia* with some flexibility of interpretation.

III

Property on Kalpeni consisted mainly of cultivable land, trees (mostly coconut), houses and house sites, stores and sheds, pits for soaking coconut husk, and fishing channels. It also included movables like *odam* (sailing craft), boats, fishing nets, ornaments and utensils. Many of these items were not difficult to dispose of even when collectively



owned. Much of the land on the island was free of tax. The rest was government land (*pandaram*) taken on lease, on which tax had to be paid on the basis of the number of yielding trees on it. This was known as *cowle* land. Coconut trees were naturally watched very carefully.

Property was of two kinds: *velliarcha* (Friday) property and *thingalarcha* (Monday) property.[12] Friday property belonged to the *taravad* and could not be given away or sold without the consent of all the adult members of the group. Traditionally *taravad* property was impartible in that there was no transfer of absolute right of possession to its branches and division was regarded not as permanent fragmentation but as an expedient for the convenience of the group's members. The principle of division of property in a matrilineal group gave equal shares to all the children of a woman. This stirpital basis of divisions was characteristic of Kalpeni and Androth islands. The other principal islands followed a per capita form of division in which all the members of a *taravad* or its branches were entitled to equal shares irrespective of generation.[13]

If a *taravad* or a *tavazhi* continued to grow, each generation might see one or more divisions of property. Each adult member had the right to ask for partition and his or her share. The simplest device was to divide the coconuts that constituted the produce. Another kind of division that was common was of trees, mainly coconut trees. Houses and storage sheds would also be allotted, as would ornaments and utensils. The use of fishing nets and soaking pits would also be divided. A full-fledged partition generally involved divisions of trees with the help of identifying marks, of land for planting trees, of cultivable land, and of soaking pits, fishing channels, houses and house sites, and movables. *Odams*, sailing craft, generally continued to be in joint possession and use for long periods.

Houses were built and expanded in reference to particular women. Women were looked upon as their constant occupants, for they received their husbands and reared their children there. Property was managed by a male. Generally the oldest man in the oldest generation of the property group had this responsibility, but ability to manage and participation in productive activities were also taken into consideration. In the absence of an adult or responsible male in the group it might also be managed by the husband of one of the women. This was, however, seen as a temporary measure, and such a man would not be called the *karnavar* of the group.

Women had an important role to play in production. The making of coir was their work. They also supervised or were involved in the making of vinegar and jaggery. They had the right to make simple transactions. Trade with the mainland and the general management of property were, however, in the hands of men. Elderly women had considerable power and on the whole women were not ignorant of their shares and possessions. Women's consent was essential in property transactions.

Divisions within a *taravad* or a segment of it were not regarded as fragmentation, because the property still belonged to the *taravad*. It could not be individually disposed of by either male or female members, who had only the right to their shares in it. Even if a male member moved to live with his wife and children and enjoyed his share separately, on his death his share would revert to his mother's *tavazhi*. Matrilineal property was thus supposed to remain with in the *taravad* If one branch became extin its property could go to the next close branch or branches. Even distant matriline relatives—not only those belonging to th same *taravad* but also those belonging t related *taravads* which were supposed t have had common matrilineal ancestry a some time in the past—were regarded a *attaladavakashi*, claimants or 'heirs afte extinction'. Claims of this kind were a com mon source of disputes over property.

A male member was not provided wit shelter on the matrilineal land as a matter c right. A male who wished to leave th production unit often took his share of coco nuts or trees and joined them with those o his wife and worked in their production uni It must be mentioned that uxorilocal resi dence did not automatically change a man' production unit; although it did provide a impetus for men to ask for the division o matrilineal property.

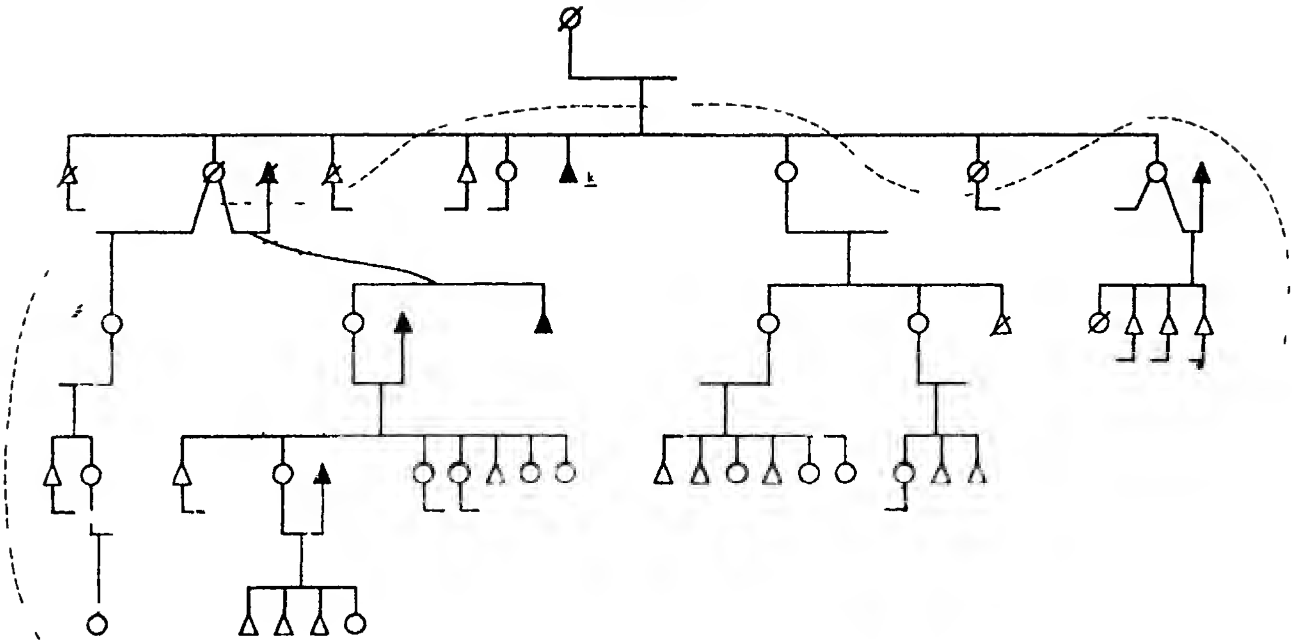
After the splitting of a property group an the division of its property among the branch es, a *tavazhi* might acquire more land an other property. This was referred to as *puthi swottu* or new property. So long as th acquisition of this property could be clearl remembered to be of a date later than th partition or was so entered in the records, i was treated as *tavazhi-taravad* (branc *taravad*) property and other branches had n right to claim in under any circumstances. I was matrilineal property for the members o the particular *tavazhi* that had acquired i and who were collectively recognised t have control over it. *Puthia swottu* owed it increase to the introduction of *cowle* lan during British rule

Ordinary divisions of *taravad* propert were not documented or registered in the court, but the island's people knew about them. Carving marks on coconut trees was the most important mechanism for identifying the shares of various branches and subbranches. Boundaries were often marked with stones or were remembered with reference to known boundaries nearby. Documents were prepared if there had been a dispute over the property, if the shares were proposed to be uneven, if some property had to be put into the full possession of a particular member or branch, and in other unusual circumstances. Documentation did not, however, mean a complete severance of ties.

IV

Thingalarcha or Monday property was known as *swontham* or one's own property and was individually disposable. Such property was acquired through one's own efforts or through a gift deed or inheritance from one's father or from some other non-matrilineal relative such as father's or mother's father or father's sister. An important way of acquiring *thingalarcha* property was the

Diagram 2



conversion of *velliarcha* (Friday) property through informal agreements or formal deeds This often came in direct conflict with the notion of collectively owned *taravad* property and the rights of reversionary heirs after extinction It was one of the most common sources of disputes

Monday property being one's own, its owner had full control over it The distinction drawn by the islanders between *velliarcha swottu* and *thingalarcha swottu* was that the former was inalienable communal property regulated by island custom and tradition (*parampara*), while the latter was one's own, individually owned and hence disposable, its disposal being governed by the *sharia* This meant that the devolution of a person's intestate *swontham* property had to be governed by Islamic law, with sons getting two parts, daughters one part, and the widow eighth share But it was also possible for individuals to gift away *swontham* property during their lifetimes to whomsoever they wished, or to prepare a will specifying the beneficiaries and their respective shares Both these courses were seen as having the sanction of Islamic law, and in the context of the social system of the island were perceived as a provision made by religion to enable a man to bring some material benefits to his children

The history of a number of related *taravads* grouped into *kutumbam* shows that *taravad* tradition was so strong that if there remained only one male in a *taravad*, very often he would have his wife and children come to live with him and flourish as a matrilineal group, combining the names of both *taravads* There was also a tendency among men to convert their Monday property into *tavazhi taravad* property for their children which could not then be individually owned or disposed of at will The principal argument in favour of such a move was that if such property were allowed to be disposed of by males in each generation, it would eventually be scattered across their children's *taravads* in small fragments When Monday property was gifted to individual children, more often than not sons and daughters received equal shares Sometimes daughters' shares might even be larger than sons'

The acquisition and disposal of Monday property were guided by entirely different considerations In his efforts to acquire it a man was motivated by a pull towards his children and his wife It was true that a *taravad* had continuity through its members, its name and its joint property and that men valued this affiliation A strong sense of security stemmed from inalienable rights in resources for living Nonetheless a man was bound by ties of affection to his children and perhaps also by a perceived duty towards them

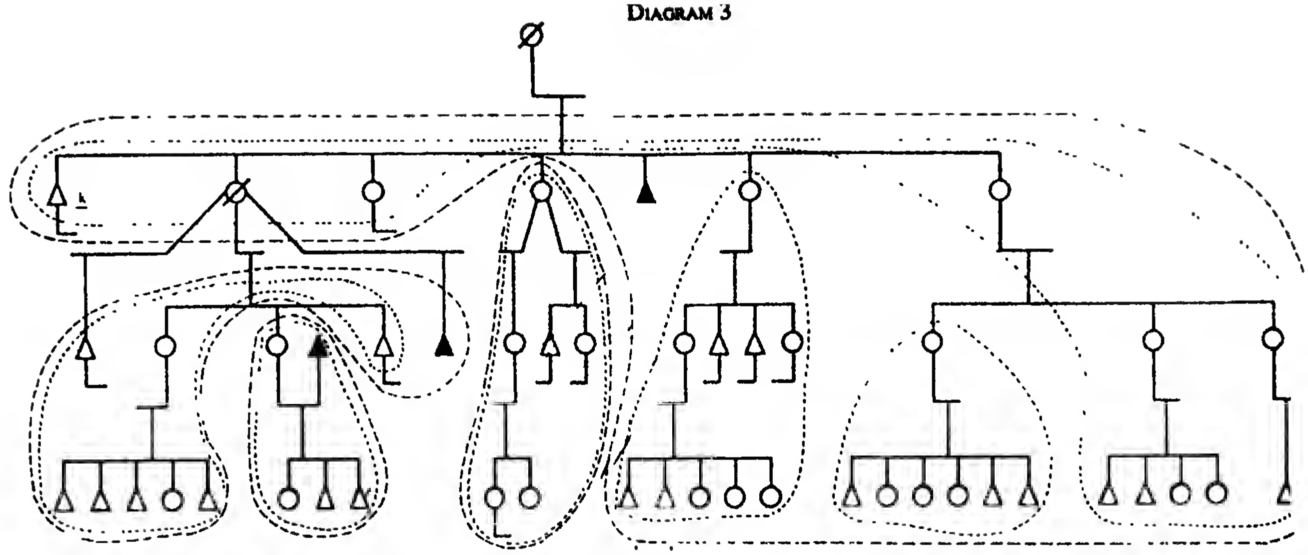
Despite matrilineal groupings and duolocal residence, a father had an important position The socio-religious ceremonies connected with his children's life cycles required his presence and placed some obligations on him [14] A man's affection for his children was clearly recognised In his later years he might settle down with his children, often bringing his share of *taravad* property, which would revert to his matrilineal segment on his death

Depending on his authority and control in his matrilineal property group, a man tried to bring some material benefits to his wife and children He might help them financially in the acquisition of property, his name being kept out of the transaction For gift deeds and bequests, of course, he needed individually owned property There were hardly any avenues for individual earning Whatever gains were made through working on and managing the matrilineal property and through trade were ideally to be used for the collective entity Although this ideal was not followed fully, it did set limits to what an individual male could do towards acquiring disposable property

What was prevalent was changing the nature of property, the conversion of some matrilineal property into one's own Rules were manipulated and circumstances manoeuvred to do this With old *taravad* property this was difficult, particularly if the *taravad* was large or had distant claimants after extinction Attempts to establish control over such property often ended in failure But in the case of *puthia swottu*, newly acquired property, which belonged to a particular segment, a man could often prevail upon other members to execute a deed of consent transferring some of it to him as his individual possession Different means might be employed persuasion, cajolery, secret deeds made with the help of members of the island council, and some kind of bargaining with other members of the *tavazhi* or *taravad*

Careful planning and deft manoeuvring could enable a man to convert some

Diagram 3



matrilineal property into *swontham*, his own and thus disposable. Often the last surviving members of a *taravad* or *tavazhi* had tried to give the matrilineal property in their charge to non-matrilineal relatives—wife and children in the case of men and, less often, brother's or son's wife and children in the case of women.

The analysis of the success or failure of these ventures is revealing. The use of customary law with some mingling of Islamic law as interpreted by those in power, coupled with the paucity of written records accorded ample scope for manipulation and for the interplay of various kinds of interests, values and norms. Decisions lay in the hands of the council of elders, and there were ways of pleasing them. In such circumstances, when both parties were willing to concede a little and thereby gain a little, compromise was regarded as the safest course.

Interestingly, the same actors had opposite roles in different situations and contexts. A father trying to bring some matrilineal property into his individual possession and a *karnavar* or other *taravad* member defending the sanctity of the matrilineal heritage and the rights of 'innocent and helpless *taravad* members' appear to represent contradictory figures—but the same persons might play both roles in different contexts, and both were accepted in the island's culture. Further, at different times a man might have different intentions in relation to a unit of property and might invoke different norms and values.

I present two cases to illustrate concrete situations of devolution and disposal of property. The abbreviated names ending with K or KY stand for 'Koya' and represent males, while those ending with B or BI stand for 'Bi' and represent females.[15]

Case I

PP *taravad* (Diagram 5) was in possession of old *taravad* property as well as a substantial area of *pandaram* land taken on lease (*cowle*) when KMK of generation 1 was the *karnavar*. In 1933 there were two houses of this *taravad* but the property had not yet been divided. In the western house lived an old uncle, KKY, and AMB, the young daughter of his deceased sister KSB, along with her minor son. The eastern house was occupied by the *tavazhi* of AKB, another deceased sister of KKY, consisting of three brothers—ALK, MMK and ARK—their deceased sister SLB's two daughters ATB and BFB, and ATB's minor children. Since KKY was old the property was being managed by ALK. He was an efficient and strong-willed man and managed the affairs of the already prosperous *taravad* well, expanding its resources. He was an important man on Kalpeni.

According to island custom KKY and AMB (through her deceased mother) were entitled to two-thirds of the property of the *taravad*, leaving only a third to all the members of the eastern house. ALK's share was located in the second *tavazhi*. ALK and his brothers discussed the matter with some elders. They emphasised the unfairness of such a division, for their *tavazhi* was much more numerous than the other, and with their sisters they were the real contributors towards the managerial and productive activities of the *taravad*. They wanted to redress this imbalance by separating some property of the *taravad* before the division of the two houses was effected. With this end in view they executed a deed according to which two pieces of *cowle* land (one with 200 coconut trees and the other with 300 coconut trees) were to be retained in the possession of ALK for the general management of the *taravad* properties; some non-taxable (*jenmom*) *taravad* land and another piece of *cowle* land were also brought into ALK's possession as manager of the properties, and some other old *taravad* lands were put in possession of MMK and ARK for management. Although ostensibly all this was being done for the sake of efficient management, this high-handed activity was clearly a prelude to the changing of some *taravad* property into Monday property.

KKY and his niece AMB filed suits (Nos 13/33 and 14/33) in the island court claiming that ALK and his brothers had no right to take any decisions about the undivided *taravad* property without their consent. In January 1934 a compromise was effected and a consent deed was executed with the signatures of all the adult members of the *taravad*. The deed was as follows:

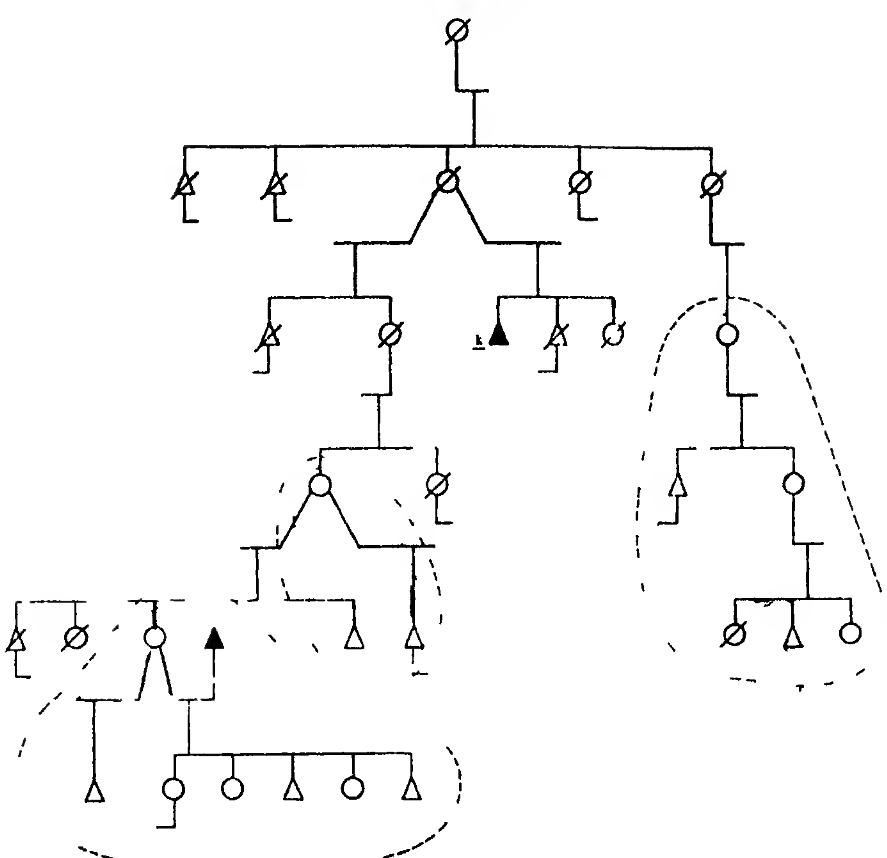
Before the Amin of Kalpeni Island

The following compromise has been arrived at in the presence of the Amin and the Kutchery Karnavars present by the parties and their heirs in PP Taravad:

The three lands, viz, the two Cowle lands to be retained in possession of ALK as per possession deed No 611 of 20.2.1933, executed by ALK (the first Respondent in suit No 13/33 filed by AMB and Respondent in suit No 14/33 filed by KKY) and Kutchery Karnavar MMK (the second Respondent in suit No 13) and ARK (the third Respondent), for the management of PP Taravad properties, and also the Madappally Taravad lands; North Pandaram (S No 1/18) and all trees thereon are to be in the sole possession of ALK and all others have to relinquish their rights;

North Pandaram (S No 1/20) Cowle land is to be in possession of ALK to be enjoyed by him till his death; after ALK's death, it is agreed that the four persons, viz, (1) MMK, (2) ARK, (3) ATB and (4) BFB can divide the above into four parts and look after and enjoy them according to their will; and in the event of the death of any one of the four, the remaining living members among the four

Diagram 4



should relinquish the right of the deceased in favour of his/her children,

Madappally land and trees thereon, after the death of ALK, should be divided into two and looked after by the two houses of PP Taravad The Odam named Puthiya Salamath registered in the name of ALK is to be managed by and as per orders of ALK The annual sailing to the mainland with copra in the month of Kumbham is to be undertaken by MMK and ARK, Respondents 2 and 3 in suit No 13/33

The remaining properties lying in possession of MMK and ARK as per deed No 611/13 (effected by the three brothers) are to be looked after by MMK and younger brother ARK along with members of 'Eastern' PP House, ATB, BFB and others, and the other part to be looked after by the two complainants, AMB and KKY, of 'Western' PP House, and North Pandaram (S No 1/16) belonging to PP Taravad now on lease to PKY of MM Taravad, on expiry of the term of lease, to be divided into two and looked after by both the houses,

In the event of there being any ceremonies, etc it should be celebrated along with ALK and the profits (coconuts) collected from the Taravad so far are to be enjoyed by Respondents 2 and 3 towards clearance of old debts and for pay ment to Government towards leases, and in future in respect of Pandaram leases, tax will be paid to the Government by the concerned people in respect of the land in their possession

Cases 13 and 14 have been settled on the above lines

[Signatures]

10th June 1934

In this transaction ALK got cowle land with 200 trees as his individual possession to be disposed of by him at will The other *cowle* land with 300 trees was to be in his possession until his death, after which it would be divided equally among his brothers MMK and ARK and nieces ATB and BFB as their individual disposable possessions In the event of anyone's death the shares of the deceased would be inherited by his or her children All this thus became Monday property

ALK also got under his control some old *taravad* land and some more *cowle* land, but without the right of disposal after his death it was to be divided equally between the two houses Some more *taravad* land which had been placed in possession of ALK's two brothers according to a previous document had to be divided into two parts, one to be given to each *tavazhi*

Two Kutchery Karnavars were assigned the duty of making an equitable division of all the *taravad* properties including house sites, cultivable lands, old *taravad* land and coconut trees, betel vines, breadfruit trees, *cowle* lands, boat sheds, etc The consent document makes it clear that although members of the western house could not get the two-thirds of the whole property, to which they were entitled according to customary stirpital division, they could save a considerable portion of the property from going into the hands of the other house ALK and his brothers for their part, succeeded in getting sizeable portions of matrilineal property in their individual possession, ALK getting the most out of this bargain In the process the two nieces (ATB and BFB) who had been persuaded to agree to the compromise also got some Monday property This compromise was viewed by all as the best possible solution It has already been mentioned that ALK had considerable clout on the island

Later all three brothers left the eastern house and settled with their respective children, to whom they gave their Monday property through gift deeds Their objective in changing the status of some of the inalienable matrilineal property was thus fulfilled As ruefully emphasised to me by ARK's children, their father's eldest brother ALK had gained the most in the whole transaction

It would be interesting to look at what ALK did with his disposable property In 1945 he executed the following gift deed in favour of his children

No 1189/45 Gift Deed executed by PP ALK to his children in KNK House, namely, CRK, KNK BI and her children at present and in future

I relinquish my own rights over my *swontham* property which is now in my possession Survey No 1/18 North Pandaram including all the buildings and trees and plants as Tavazhi Taravad claims (*avakasha*) not to be partitioned in future My sons CRK and KNK should keep this property in their possession and enjoy the fruits of it The tax payable to the government (on fruit yielding trees) should be paid by them and they should get a receipt for the same

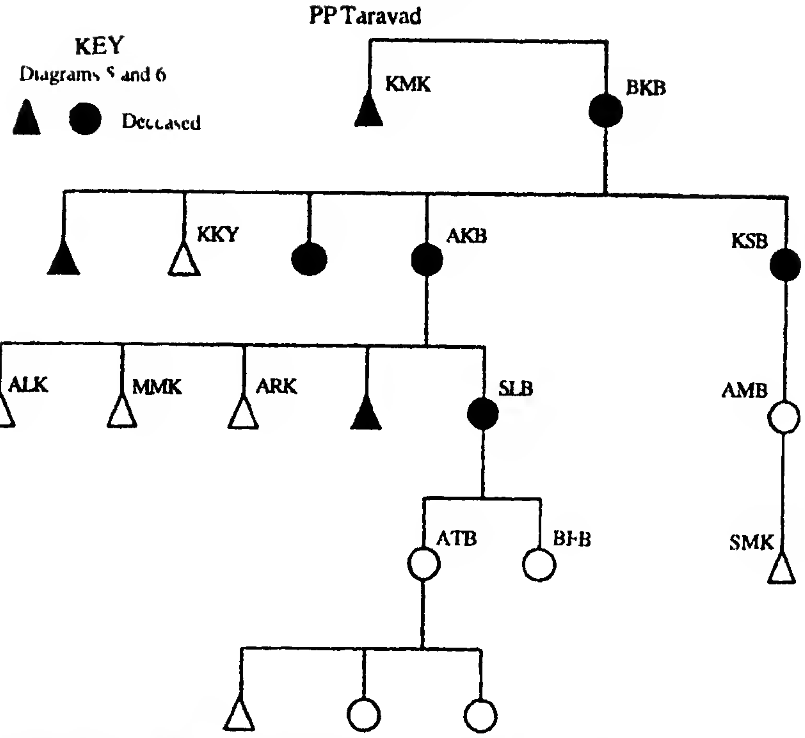
[Signatures]

23 September 1945

As is clear from the deed, ALK had changed his Monday, *swontham* property into the collectively owned *tavazhi-taravad* property of his children However, even his sons and daughter were not aware of this It was looked upon by all as individually disposable (although being managed collectively) Monday property ALK lived for six years after the registration of the gift deed and managed four kinds of property his Monday property which he had already gifted to his children his share of his own *taravad*'s property, which was to revert after his death, his children's matrilineal property (KNK *taravad*), and the Monday property that his daughter and her children had been gifted by her late husband

After ALK's death in 1952 his share of PP *taravad* property reverted to his matrilineal

Diagram 5



kin Responsibility for managing the remaining three categories of property now fell on his two sons While they were doing their best, their sister's 20-year-old son SMK began to suspect them of dishonesty and maintaining incomplete accounts His uncles tried to appease him by giving him charge of the trees gifted by his father, while one of them, CRK, continued to manage the rest of the property

The nephew continued to express his resentment He claimed that of the profits that the production group earned, his mother and her seven children—some of whom had been born after ALK's death—were entitled to eight shares and his two uncles to one share each He was perhaps mixing up the custom of per capita distribution of property followed on some of the other islands with the stirpital division seen on Kalpeni He was also expecting a very large share for his mother from the Monday property of his grandfather ALK Over time he became more and more aggressive and tried to take the management of the property into his own hands He began to give orders to the labourers regarding the plucking of coconuts One of the uncles then re-established control over the labourers and took the plucked coconuts in his charge

SMK filed a suit in the Amin's court and presented his case before the elders of the island council He argued that although his mother and her children together had claims to a much larger portion of the group's property, he was not being allowed to deal with the labourers and get the coconuts plucked The elders and the Amin then perused the gift deed of ALK, which had been registered in the previous Amin's time They found that the nephew's claims were unfounded, for the property was no longer Monday property The two uncles, for their part, now realised that their father had turned his Monday property into *tavazhi taravad* property and that as individuals they had no right of disposal over any part of it

This situation did not suit either party After negotiations with the help of elders a compromise was effected With the consent of all the adult members of the late ALK's deceased wife's *tavazhi*—the two sons KNK and CRK, the daughter, BI, and BI's adult children—the property gifted by ALK was changed from *tavazhi-taravad* to individually disposable Monday property In this compromise the two brothers KNK and CRK had to be satisfied with only one share of ALK's property divided between the two of them, two shares going to their sister According to Islamic law they should have got double the share of their sister But what the brothers got in this division was viewed by matrilineal logic as going out of their mother's *tavazhi*, and the elders therefore thought that their sister, through whom the group would continue, should get the larger share

The nephew, SMK, was agreeable, because in the event of its remaining *tavazhi-taravad* property his uncles would have enjoyed equal shares with his mother until their deaths Further, he himself would have been entitled to only a small share out of his mother's share and that too with only usufructuary rights Now he had only to persuade his mother to distribute her share amongst herself and her children as Monday property

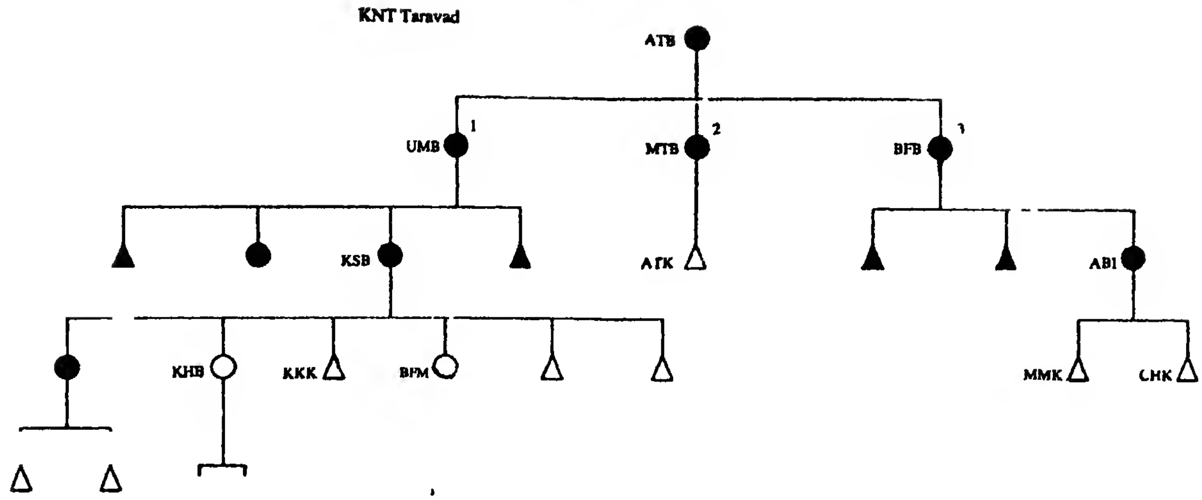
This is what happened After the compromise, with pressure from her children, particularly SMK, BI's share of her Monday property received from her father and that received from her deceased husband were combined and then divided into nine shares Two of these went to BI and the rest were divided among her seven children Although this property was managed as a unit, with all production activities carried on collectively, these shares were clearly recognised as Monday property disposable at the will of the owner

Subsequent events provide instances of the way in which Islamic law was interpreted and applied in the disposal of intestate *swontham* property We shall narrate only one of them Just one year after the compromise had been effected and ALK's Monday property had been divided among his sons and daughter, one of the sons, CRK, died before preparing a gift deed When the question of the disposal of his Monday property came up his brother, KNK, argued that their father had incurred some debts which had remained unpaid and therefore a part of CRK's share should be used for this purpose Thus it was decided that one part of CRK's *swontham* property would be shared between KNK and their sister BI, to be used towards repaying the debts, while the remaining part (about 68 trees) would be distributed, according to the *sharia*, among his widow and five children From oral accounts I gathered that the sons got double the share of their sisters, while the widow got the share stipulated by Islamic law

Thus, as a brother and a sister survived to stake their claims, half of CRK's intestate Monday property could not go to his children It appears that the rule laid down in Islamic law by which debts were the first charge on a person's property, before it could be willed or distributed intestate, was invoked by KNK The correct procedure would have been to take note of ALK's debts at the time of the division of his Monday property among his children a year earlier This is an example of how a somewhat vague understanding of Islamic law was taken advantage of by those who had the power and opportunity Changes in alignments also need to be noted In this deal KNK and his sister, along with her son SMK, who had just a year earlier fought his uncles, joined hands to appropriate half of CRK's *swontham* property

Finally SMK, who had first challenged his uncles and brought about a division and then persuaded his mother to separate from the *tavashi-taravad* property her Monday property obtained from two sources, died unexpectedly On a trading voyage to the mainland his *odam* was caught in a cyclone and sank The devolution of his share of Monday property (20 trees) was broadly guided by Islamic law, his mother (and perhaps his brothers) getting three trees,

DIAGRAM 6



with the remainder going to his wife and children

KNK, the one surviving son of ALK, was over 50 and suffering from tuberculosis when I met him in 1969 Sixteen years previously he had moved to live with his wife and children He had already had prepared a proper gift document pertaining to the devolution of his Monday property to his wife and children

CASE 2

This is the story of divisions, compromises and gift deeds in KNT *taravad*, which provided the Kazis of Kalpeni (Diagram 6) In 1935 the three *tavazhis* of the three sisters UMB MTB and BFB had divided their land, trees and all other property through a written document However, following island custom, this was not to be regarded as a complete severance of matrilineal ties and the end of reversionary claims to property In spite of such an understanding, in 1953 ATK, who was by then old and was the only person left in MTB's *tavazhi*, transferred some of his *taravad* property through a deed to his son PKY and daughter KDB in KNK *taravad* He died before the deed could reach the court The Kazi, MMK, ATK's SiDa's son, filed a case in the Amin's court against ATK's children in KNK *taravad*, to recover the property given to them by their father The Amin at the time—CRK of CG *taravad*—was the husband of KSB of *tavazhi* 1 in KNT *taravad* He did not consider it wise to take up the case and kept the file for disposal by the inspecting officer, who visited Kalpeni in 1954 The inspecting officer referred the case to a special court of *karnavars*

After a hearing everybody concerned was persuaded to work towards a compromise Because of the time that had elapsed since the gift deed was made, the transfer of property to PKY and KDB in KNK *taravad* had already become a reality and could not easily be undone in its entirety The deed that had effected the division of the three *tavazhis* in 1935 was carefully examined and stock was taken of the composition of the two existing *tavazhis* (1 and 3) After prolonged deliberations an agreement was arrived at

It needs to be pointed out that *tavazhi* 3 had some very powerful people in it, particularly MMK who was not only the Kazi of the island but also a Kutchery *karnavar* But *tavazhi* 1 had the support of the Amin, whose wife KSB was by then dead but whose children's and grandchildren's interests were involved Second, only *tavazhi* 1 had female members who could ensure the continuity of KNT *taravad* It is clear that these factors guided the decisions taken regarding the distribution of the *taravad* properties and the conversion of some of them to Monday or disposable property

While PKY and KDB of KNK *taravad* got some of the property which had been in the possession of their father ATK, they could not retain all that had been gifted to them Much of it had to be transferred to MMK, the Kazi, as his Monday property Further, a fair amount of *taravad* property in the possession of CHK, MMK's brother, was made into Monday property which he could dispose of at will Those two were the only surviving members of their *tavazhi* Definitely they used the dispute to their advantage and succeeded in acquiring considerable *swontham* property for themselves by changing the status of matrilineally owned property

At the same time, an effort was made to equitably distribute property between the two surviving *tavazhis* The condition was imposed that the *taravad*'s trees being looked after and enjoyed by members of *tavazhi* 1 and by MMK and CHK in *tavazhi* 3 should not be disposed of through any document, nor should any debts be incurred against them It was further recorded that if money were needed for reasonable purposes, the members of the *taravad* were at liberty to lease the trees—but only to other claimants and not to outsiders It was added that the land on which the *taravad* house earmarked for BFB's *tavazhi* (*tavazhi* 3) stood should be given to *tavazhi* 1 for planting trees and that members of *tavazhi* 3 should plant no more trees on it They could enjoy the trees already planted on this land, but after their deaths the trees would go to the matrilineal claimants that is, members of KNT *taravad*– in effect *tavazhi* 1, which alone would have continuity through female children This condition was clearly included in the document to keep the *taravad* house and the land around it within the taravad by making it difficult for the surviving members of BFB's *tavazhi* to make any claim on these as disposable property

This case effectively illustrates the interlocking and working of various factors the material interests of the various individuals and groups—sibling groups, a mother and her children as a unit a father's concern (the Amin's) for his children's interest in property received through their mother, a sense of morality associated with protecting the name, identity, prosperity and reputation of one's *taravad* the ethics of protecting the rights of *taravad* members to the assets of the matrilineal unit and male members' interest in acquiring some disposable property for their children Besides emphasising morality, it was also considered sensible to keep the properties of a matrilineal unit together and not permit them to be fragmented and frittered away through male members, whose children would be scattered across many *taravads*

Men's concern for their children as expressed through their interest in acquiring some disposable property was not, however, viewed as indicative of a base element in man's nature It was considered a natural expression of a father's sentiments an aspect of his role which, while not being looked upon as obligatory, was considered to have the approval and even commendation of religion At the same

time, obvious misuse of power and the control over property made possible through managerial rights and the use of manipulative strategies that went against the interest of one's matrilineal group were looked upon as violations of traditional values.

In the end we may look at MMK's disposal of the Monday property he had acquired in the process of settling the dispute that arose because of ATK's attempt to benefit his children at the cost of the interests of the *taravad*. His gift deed is reproduced below.

> The gift deed executed by Kalpeni islander Kazi MMK of KNT Taravad, Kutchery Karnavar, in favour of his two wives (1) EP BFB (who has no children), and (2) KNK KNB, and KNB's children (3) AMB, (4) ATB, (5) KDB, and other children to be born through the above two wives
>
> *To look after me till my death* [emphasis added]. If from among the above mentioned wives and children any one dies, the share of property of the deceased should not be divided according to Muslim law of inheritance; the persons mentioned in the deed should divide it equally among themselves.
>
> When I got this property as my own as per consent statement No 90/55 dated 21st May, 1955 I was given the right to dispose of it according to my wish. It consists of Jenmom land, trees and plants and a Shrambi. (As usual the property is enumerated in the government deed.) Today onwards I relinquish my right over the above with my full will.
>
> [Signatures]

Thus the Kazi had taken precautions to ensure that once gifted, his disposable property would not be treated as *thingalarcha* (Monday) property. After her death the share of the childless wife would go to her co-wife's *tavazhi* in KNK *taravad*. Second, the property gifted to the other wife KNB and her children would be treated as *tavazhi-taravad* property that could be disposed of only with the consent of every one of them. Well versed in religious lore and Islamic law, MMK was also firmly rooted in the matrilineal ethos and the values of the island. He was clear about the advantages of keeping together and in continuity, in a *tavazhi* of siblings, even such property as had been acquired by their father with the invocation of Islamic values. The property was no longer vulnerable to fragmentation into insignificant portions. He appeared to be at peace with himself and convinced of the wisdom and correctness of his decision. All this came out clearly during my conversation with him.

VI

In a way two legal systems operated on the island. Marriage and divorce were in the domain of the Kazi, who held meetings (*kootam*) to listen to grievances, to mediate, to provide an opportunity for negotiation and reconciliation, and, if necessary, to pronounce judgment, often in consultation with elders. Issues pertaining to the settlement of dues between divorcing parties and any matters relating to property arising out of divorce could be referred to the island council if they were not settled by the *kootam* or informally.

As regards individually owned property, which was supposed to be governed by Islamic law, disputes over its disposal and inheritance were invariably taken to the island council if no informal settlement could be reached. So also were disputes over matrilineal property governed by customary law. Informal documents with witnesses' signatures and oral declarations were not uncommon, but gift deeds, bequests and consent deeds—mainly among matrilineal kin—and other documents relating to property were registered in the Amin's Kutchery with *karnavars* as witnesses. Further, suits were filed in the Kutchery and the Amin was empowered to deal with them with the assistance of elders.

Matrilineal and *swontham* property were intermeshed and mixed due to several factors: through manipulation and because of the nature of productive activity that required collective endeavour, the concentration of trading operations in a few hands, and the cultural and structural pull towards the matrilineal rationale. This seems to have led to what has been described as a selective use of the two legal systems, each supposed to apply to one type of property.

On Kalpeni a single adjudicatory machinery dealt with matters pertaining to property, the island council. The council could seek the advice of those reputed to be well versed in Islamic learning and in the island's *parampara*, but in the final analysis it was the decision-maker. Within the council itself there were elders conversant with Islamic law. Further, the inspecting officer who visited the island and the appellate court on the mainland were expected to deal with the cases coming before them on the basis of the legal systems prevalent on Kalpeni. This raises the possibility of misinterpretation and inexact application of both customary and Islamic law by colonial officers who were more conversant with the laws operating among the matrilineal Nayar and Mappilla on the mainland and who could not be supposed to know about the intricacies of relationships, interests and power equations involved in particular cases.

A related issue concerns the possibility of modifications being made to their arguments by islanders in the light of the reactions of judges who came from outside the island culture. A number of cases are instances of this. Others throw light on the functioning of the island council. No Kutchery *karnavar* could be regarded as being uniformly impartial. Alignments through the marriages, parenthood and matrilineal links of particular *karnavars* exercised an influence over others and often resulted in the twisting of arguments. Often the material interests of particular *karnavars* were put to use by contending parties.

How was Islamic law used and applied? As Benda-Beckman (1984) argues in the context of the Minangkabau, even when Islamic terms are used the legal reality may be different from what is found in Islamic law. We shall illustrate this with the existence of ancestral property on the island and the making of wills and gift deeds and their execution.[16]

It is well known that the notion of ancestral property does not exist in Islamic law. Whether it was received from ascending generations or acquired by oneself, individuals are supposed to have full control over their property, heirs having no claim upon it during the individual's lifetime. On Kalpeni matrilineal joint property was viewed as a distinct category deriving from and governed by age-old traditions and thus outside the purview of Islamic law. It was believed to have been created by matrilineal ancestors for the benefit of all the members of the matrilineage in perpetuity. *Taravad* property was thus seen as akin to a charitable trust created for the good of the innocent, needy and helpless members of the matrilineage. Its justification lay in *parampara*, which was sacrosanct. As we have noted earlier, some islanders who were conscious of the contradiction between the Islamic legal conception of property and the nature of matrilineal property equated matrilineal property with *waqf* property. It is difficult to assess how widespread this idea was, but without doubt it provided a quasi-religious justification for the existence of matrilineal property.

What was disposable was *swontham* or individual property. In Islamic law there is no limitation on gift deeds executed during a person's lifetime: so long as s/he is in full command of her or his senses s/he can gift away even the whole of her or his property to any person or persons. But in the case of a bequest or will there are limitations: first, only one-third of the property can be bequeathed (after the repayment of debts, which are the first charge on it), and second, it cannot be bequeathed to one's natural heirs, that is, those who are legally entitled to inherit. On Kalpeni, like gift deeds, wills were usually made for the whole of a person's *swontham* property; and in the case of a male, the beneficiaries would invariably be his children and wife, that is, his natural heirs according to Islamic law.

It appears that the first limitation—that only a third could be bequeathed—was irrelevant even for those well versed in Islamic law, for *swontham* property did not constitute the whole of a man's property: he had rights of use over his share of matrilineal property, which provided the main source of his living. It is difficult to say if the common people were even aware of this limitation. The notion was rooted in their consciousness that children's rights over *swontham*

property had religious sanction and that it went against religion to deprive children of their fathers' individual property.

Second, the question of who were a man's natural heirs did not seem to come up formally in any dispute relating to the disposal of *swontham* property. Neither the island council nor the people saw in this any deviation from Islamic law. In keeping with the matrilineal ideology, a man's children were not viewed as his natural heirs: that position was accorded to his matrilineal kin, particularly his sisters' children. In many disputes over matrilineal property in which a man's will or gift deed were challenged, and in documents relating to the division of property, it was a man's sisters' children who were referred to as 'heirs' and rightful claimants. In their absence other segments of the matrilineage, in order of closeness, would become entitled to inherit. This notion of natural heirs followed island *parampara*.

Analysis of cases and discussions with informants showed that there was a distinct preference on the island for gift deeds over wills. The explanations given make it clear that this preference had nothing to do with the two limitations of wills in Islamic law. The main apprehensions that people expressed in relation to wills related to three factors: first, the fear that the status of a particular piece of property as *swontham* might come into dispute through a resurrection of some forgotten fact or through the machinations of matrilineal kin; second, the possibility of delay (or even of refusal) on the part of matrilineal kin in handing over such property to the donor's children; and third, a genuine fear that with the donor gone, his sons might object to sharing equally with their sisters—which was the preferred pattern in wills—on the ground that that would be un-Islamic, or that they might use the same argument to oppose his wish to turn his *swontham* property into their collectively owned and not individually disposable *tavazhi-taravad* property.

With the increasing use of writing, people became keen to have gift deeds registered in the Kutchery. If the property was actually transferred it might become difficult to retrieve, as happened in Case 2 above. One more point concerning gift deeds is that in contrast to much of the Islamic world, parting with one's own property in one's lifetime was not a problem for the islanders, whose main source of livelihood was *taravad* property. People had inalienable shares in this. In any case, what with matrilineal values asserting themselves in the reconversion of *swontham* property to matrilineal property, the island never had a significant proportion of *swontham* property. In 1962-63 only 9 per cent of the coconut trees on the island were *swontham* property [Kutty 1972]. Further, a man who had gifted his own property to his children might already have moved to live with them, pooling his other property with theirs. In such cases the transfer would have become accomplished fact prior to a man's death, thus weakening the claims of his matrilineal kin.

However, recorded cases also show that gifted property was not always transferred when the gift deed was registered. It might still remain under the formal control of the donor along with his share of *tavazhi-taravad* property. This matter of untransferred gifts is significant. In Islamic law a gift necessarily connotes something that has already been transferred: it cannot exist merely as a promise, and it also has to be publicly made. But such nuances were beyond the consideration of the Kalpeni islanders. Generally we find that donors exercised caution in ensuring that the legal formalities were completed although property might not actually change hands. Further, in respect of gifted property whose status was not beyond dispute, where there was some risk that matrilineal kin might create obstacles, special efforts were made to maintain as much secrecy as was possible in the registration of gift deeds.

It is no wonder, then, that in conflicts over property some sort of compromise was considered the best course of action. No party could be certain of a judgment in its favour. More often than not people perceived partial truths and elements of justification in the positions taken and the claims made by both contending parties. More significant were the uncertainties built into the process of adjudication because of the play of interests, emotion and power. We have already noted that no Kutcheri *karnavar* including the Amin could be expected to be impartial in all cases. They were also open to being influenced by material benefits.

This does not give the whole picture but perhaps tells enough to enable us to understand the value of compromise in property transactions and disputes.

One final observation may be made. It appears that what was viewed as sanctioned by Islam was in a way rooted in the developmental cycle of property and domestic groups in the matrilineal system and in male members' destinies in it. While women were firmly rooted in their *taravads* and in their houses in the physical sense of the term, men's links were weaker. A man was sure to be looked after well so long as his mother was alive. He could hope to receive care while his sisters—including MoSiDas of his age group—were alive and physically active. However, when his nieces took over the household and when he became unproductive and surrendered managerial privileges to his nephews, he could expect more care from his wife and children in their *taravad*.

A man's desire to gift some property to his wife and children was considered both appropriate and logical. If he wished to move over to live with his wife and children even while managing the property of his own matrilineal group, the logic of the situation justified his inclination to gift some assets to the household which was looking after him and would continue to care for him. The texts of many gift deeds corroborate this: that executed by MHK of KNT *taravad* is an excellent example. Many documents clearly stated that the anticipation of being looked after in old age was the main justification for gifting property.

The passing of resources from one generation to the next does not seem to have been only a moral issue. The essential inseparability of the ideology and material basis of kinship is clearly demonstrated in the rules and processes relating to kinship in this island society.

Notes

[This paper is to be published in a forthcoming Festschrift volume in honour of M N Srinivas. I chose this subject for this volume because Srinivas' work on disputes has given direction to many of us. I thank S C Dube for his suggestions. Mukul Dube edited and typed the script and drew the diagrams.]

1 Perhaps no social system would appear to be so incompatible with the ideology of Islam and demand so much adjustment and accommodation as a matrilineal one. Although Robertson Smith has spoken of traces of matriliny in Arabia, even a cursory look at the Quran, the Hadith and the legal provisions in Islam reveals a marked patrilineal emphasis. Elsewhere in our analysis of the social system of Kalpeni island [Dube 1969, Kutty 1972] we have attempted to understand the process of accommodation and compromise between the two apparently incompatible system. A R Kutty, to whom I owe my interest in the subject, was my student in the 1960s.

2 A R Kutty's (1972) ethnographic account of Kalpeni, upon which I have drawn here, was based on fieldwork carried out in 1961-63. I did fieldwork on the island some years later, in 1969. This paper essentially relates to the period before the end of the 1960s. Several changes occurred after the formation of a Union Territory of the islands. For instance, the Amin's powers were curtailed and tahsildars and sub-tahsildars were appointed. These changes are ignored here. I have therefore avoided the use of the ethnographic present, although in their basic features the social structure and culture of the islands have not changed radically [Saigal 1990].

The cases relating to property were gathered by the extended case method through documents, genealogies and free-flowing as well as focused interviews. My informants and narrators included some of the main actors or their descendants or opponents, mediators and adjudicators, as well as others who possessed relevant information because of direct or indirect interest in specific cases. Many records of partition, wills, gift deeds and suits were taken from the registers in the Kutchery and then followed up with informants. Over 30 cases were collected.

Among the many scholars whose work influenced me at various times are Benda-Beckman

(1984), Colson (1961 1980), Comaroff and Roberts (1981), Epstein (1967a 1967b) Gluckman (1958) Mitchell (1956), Nader and Todd (eds) (1978) Roberts (1979), Srinivas (1952 1954, 1959) and Turner (1957) In the study of matriliny on Kalpeni I have gained substantially from the work of the late Kathleen Gough (1959 1961) and from discussions with her

3 For a detailed argument regarding the most plausible period of these migrations see Dube (1978) There is, however no uniformity in early accounts See Logan (1877) Ittaman (1976), Mannadiar (1977), Saigal (1990)

4 By 1981 the population had risen to 3 543 These figures include the floating population of government officials and their families

5 See Dube 1978 British officers such as Robinson (1846, 1848), Logan (1877) and Ellis (1924) have written extensively about the caste-like groups on the islands Kutty (1972) has given a detailed account of the confrontations between the Koya and the Melacheri on Kalpeni

6 The positions of *karnavars* elders or jurors were hereditary for particular important *taravads* Each of these *taravads* had a history of how and when the *patta* or authorisation for *karnavar* status was obtained from the Cannanore rulers There were 16 such Koya *taravads* It was only later near the middle of this century that some Malmi and Melacheri *karnavars* were appointed to the council

7 So long as a man continued to visit his wife he was expected to make a customary annual payment of rice and coconuts to her household and to bring garments and fabric for her He was also expected to meet part of her requirements of fancy clothes cosmetics and ornaments It was common for a man to send to his wife s household such things as tea, sugar and spices Gifts were also made to the wife at important festivals their value depending on the husband's means

8 More than half of the men and women on the island had married more than once, and many had married several times Marriage was brittle, divorce was easy Men had a higher rate of remarriage unlike women they could remarry even while an earlier marriage was extant and did not have to wait out a three-month period of *iddat* after a divorce or the death of a spouse It was the irrevocable *talaq* that was practised Although formally the initiative lay with the husband, the pattern of marital residence enabled a woman to express her unwillingness to continue in a marriage

9 These four diagrams represent four actual taravads on the island Diagram 1 shows a *taravad* that was also a property group and a domestic group The *taravad* in Diagram 2 consisted of a single property group made up of several domestic groups The *taravad* in Diagram 3 consisted of four property groups, each of which had in it one or more domestic groups Diagram 4 pictures a *taravad* with three property groups that were also domestic groups

10 The descendants of one woman were set off as a unit from those of her sisters this unit being known as a *tavazhi* Each woman of a *taravad* could thus have a *tavazhi* descending from her It was a somewhat flexible term and was used to denote both an intermediary segment in the context of a larger group and a minimal segment of two-generation depth [Kutty 1972]

11 An emphasis on *ibadat* appears to express very well the practice of Islam in Lakshadweep The number of mosques on Kalpeni was quite disproportionate to the population and the physical space The islanders were very particular about prayer and fasting the giving of alms on specific occasions and discourses by visiting religious dignitaries *Haj* was considered difficult on account of expense but those who had performed the pilgrimage were given special respect Most important activities related to religion were undertaken by matrilineal groups The practice of religion thus appears to have been a reaffirmation of the solidarity of the kinship group a buttressing of the relationships and values of the existing social structure For an account of the following of particular saints such as Mohiddin Sheik and Riffai Sheik and the use of amulets, see Dube (1969) and Kutty (1972)

12 The etymology and significance of Friday and 'Monday are not known Friday property could be interpreted as being collective following the communal prayer characteristic of that day The collective property of the *taravad* was justified by some persons as a form of *waqf* property created for the benefit of a group of matrikin This could not be disposed of but would be used for the livelihood of all the members of the group As is well known only the income of *waqf* property may be used the property may not be disposed of

13 In this division according to stirpes or branches a person who had a number of siblings would have a much smaller share than his mother s brother No comparison has been attempted so far of property disputes on Kalpeni and Androth with those on the other islands nor has there been an investigation of the texture of the MoBr SiSo relationship in the two sets of islands

14 A father contributed to the expenses of child birth and paid the midwife He also paid the barber who shaved the child's head on its 40th day The major part of the expense on this ceremony was borne by the father supported by his matrilineal unit In circumcision and in marriage he had an important part to play giving gifts and bearing part of the expenses A man acted as *wali* (guardian) in the marriage of his daughter gave her ceremonial clothes and spent on the decoration of the bridal chamber He received the *mahr* on behalf of the bride [see Kutty 1972]

15 Most of the cases that I collected relating to property were from among the Koya the traditional owners of land rights Only members of the Koya group were permitted these suffixes

16 I am thankful to Danial Latifi, scholar and senior advocate of the Supreme Court of India, for enlightening discussions on these points

Rural Non-Agricultural Employment in Kerala

Some Emerging Tendencies

Mridul Eapen

An attempt is made in this paper to review in detail changes in the structure of rural employment in Kerala, in particular non-agricultural employment, focusing on the weaknesses of the emerging structure. Section I of the paper discusses the relevant characteristics of Kerala's rural economy. Section II presents the empirical evidence. Section III attempts to explain the changes observed by identifying some broad causal factors and Section IV presents the author's conclusions.

WHILE the near constancy of the occupational structure in India has been a major cause for concern, Kerala has drawn considerable attention for its apparently 'developed' occupational pattern characterised as it is by a very low share of agriculture. Historically too, the share of agriculture has been much lower in Kerala—65.7 per cent for the male working force in 1911 as compared to almost 74 per cent for India, largely because a high proportion of the rural workforce was engaged in sectors other than agriculture. And it is one of the few states in which the share has steadily declined; it was 55 per cent in 1961 while for India it remained around 72 per cent [Krishnamurty 1970]. It was only since the early 70s that a noticeable shift occurred towards non-agricultural activities in rural India affecting the overall employment pattern in the country. The picture is slightly different with the inclusion of females and with the use of the National Sample Survey data; however the overall trends broadly remain the same. And this, despite the fact that Kerala was one of the states which received relatively little attention in the overall industrialisation strategy pursued in the post-independence period. Its share in public sector investment remained low and in fact declined over time [Subramanian 1990].

That experiences of some nations (and presumably sub-regions) could diverge from the common or universal path of long-run development based on industrialisation, was recognised and sources of diversity were stated to be no less important than those of uniformity [Kuznets 1959; Chenery 1960]. However these were expected to operate at a lower level of aggregation, while there were uniformities at an aggregate or macro-level of analysis. The transition from an agricultural to a non-agricultural economy in the process of growth could be regarded as the broad, universal tendency at the aggregate level, while differences could exist in other dimensions, viz, in industrial composition or sequencing of changes during the process, or in sources of financing capital accumulation. Or as argued by some other contributors to the thesis of structural transformation, even the path of transition could be different [Syrquin 1988]. In the context of India's development experience, as also of certain other agriculture-dominated Asian economies, the interesting question was why the macro-level change failed to occur even after a considerable lag, despite the similarity of paths, viz, industrialisation at the lower level.

The failure of the path of industrialisation adopted in these economies to absorb 'surplus' labour from rural areas into the urban modern sector at the pace envisaged in the early development literature [Lewis 1954] resulted in the continued dependence of more or less the same percentage of population on agriculture as a means of precarious livelihood. The larger proportion of those who did migrate into cities tended to be absorbed in the urban informal sector. Initially, the adverse impact of this regional imbalance was sought to be muted by a policy of relocating or strengthening industry in peripheral or rural areas in an attempt to provide new avenues of employment and improve levels of living in these regions without a rural-urban transfer of labour. However, the policies evolved to achieve industrial deconcentration, which assigned a special role to small-scale industries, failed to produce the desired results. This was primarily due to non-development of spread effects via linkages as envisaged, while the emerging linkages in some cases were stronger to the bigger cities rather than to the local, rural areas [Uribe-Echevarria 1991]. The focus of policy then shifted from the spatial to a sectoral approach, viz, the need to develop agriculture which had been relatively neglected given the overwhelming emphasis on industrialisation. Priority was given to integrated rural development. However, the limitations of too sectoral an approach, neglecting the rural-urban linkages and the immense difficulty in creating productive employment within agriculture for a rapidly growing rural labour force, despite large increases in agricultural investment, focused attention on the need to generate non-agricultural employment in rural areas. The emphasis was once again on rural small-scale industries, but with a difference: the latter were to be stimulated endogenously via consumption and production linkages generated through a sustained process of agricultural growth, unlike the earlier exogenously implanted rural industrialisation policies. This of course was tantamount to an agriculture-led growth strategy as had been advocated by some economists [Johnston and Mellor 1961; Mellor 1976; etc).

The fact that there was indeed a perceptible shift in the rural occupational structure towards non-agricultural activities since the early 70s, and towards the manufacturing sector (according to the census), further strengthened this policy thrust. Coming after a long period of constancy, this shift in the occupational structure stimulated a substantial amount of research, both at the national and regional levels, on the significance of non-agricultural employment in rural areas, its pattern and determinants, focusing on the factors behind the recent shift [Vaidyanathan 1986]. Though not always explicitly stated, the primary concern was to determine the implications of this shift to the process of growth: was it primarily a short-term phenomenon for propping up the levels of living of the rural poor or could it be viewed as more sustainable, given the generation of appropriate stimuli, the most important being production and consumption linkages associated with rising agricultural growth. While studies did find a positive association between rural non-agricultural employment and agricultural growth/productivity, in particular unleashed by the Green Revolution strategy, it offered only a partial explanation; factors external to the rural sector also appeared important as also the possibility of the non-agricultural sector acting as a 'sponge', given the tremendous 'push' out of agriculture. Moreover, the impact of agricultural growth on the creation of small-scale industries as a response to increased rural consumption of manufactured products was not strong; though the demand inducing effects of higher agricultural productivity were greater than the local raw material supply effect [Papola 1987].

The thrust over time has increasingly veered around to the view that the growth of rural non-agricultural employment needs to be perceived as a sustainable process. Hence attempts have continued to be made, at the all-India level and for individual states to

capture the various stimuli to diversification of the rural economy both positive and negative as also internal/external to the rural sector [Sankaranarayanan 1980 Unni 1990, Dev 1990 Basant and Parthasarathy 1991, Shukla 1991, Jayaraj 1992 Kundu 1993 Chandrashekhar 1993 Basu and Kashyap 1993] It has become an important policy instrument for improving levels of living of the rural poor However, given the past failure of the process of growth to 'trickle down' to the village level, planning for rural diversification appears possible now only with some form of decentralised development and the newly enacted Panchayat Raj Bill, if implemented judiciously should go a long way towards achieving this end It is within such a framework that we study Kerala's experience, which has a longer history and is in some ways unique

While its distinct occupational pattern has drawn considerable attention, no indepth study has been undertaken to examine the pattern and determinants of rural non-agricultural employment in Kerala particularly in recent years, except as part of all-India studies Given the consistently high share of non-agricultural employment in rural areas in Kerala the shift in the late 70s is not as significant as at the all-India level, in fact there appears to be a 'retrogression' in its occupational structure between 1972 73 and 1977 78 However, in the 80s the growth in rural non agricultural employment is sharper in the case of Kerala

This study focuses on rural non agricultural employment in Kerala since the early 70s, a period which marks a turning point in Kerala's economy One, the process of commercialisation was intensified since the mid-70s with an accelerated shift towards the major cash crops such as coconut and rubber due to sharp changes in relative prices Two there was an unprecedented outflow of workers from rural areas also primarily to West Asia (the Gulf Boom), resulting in a large inflow of remittances That the net result of these changes (despite the relative decline in paddy prices) appears to have been some improvement in rural well being even among the lowest deciles is reflected in the consumption data Three, there was a reversal of the higher (than all India) rates of population growth due to the dramatic decline in fertility since the early 70s Coupled with the mortality declines in the early period this resulted in a shift in the age structure of the population towards the prime working age groups adding significantly to the numbers seeking employment Hence while employment opportunities in agriculture were shrinking given the lower labour use in commercial crops, and its gender bias demographic pressure on the employment market was severe and the opening up of work opportunities in the Gulf offered some relief There was of course the demand-inducing effect of the improved level of rural well-being which was a major stimulant to the growth of a number of activities in rural areas increasing the demand for labour since the late 70s However, despite a potential increase in productive capacity by way of savings generated largely from the remittances, the state could not take full advantage of this growth in demand Most of the increases in investment that occurred was in housing While this did open up a major avenue of non-agricultural employment in rural areas, viz, construction, it failed to generate any backward linkages in terms of manufacture of building materials Hence most of the gains from the accretion of incomes mentioned earlier leaked out to other states from which manufactured goods were imported. Kerala gained primarily from the increase in demand for services and a diversified food demand whose linkages however were few

It is interesting to capture the strategies for survival which had to be worked out in the wake of these major changes in the rural economy An attempt is made in this paper to review in detail changes in the structure of rural employment, in particular non agricultural, focusing on the weaknesses of the emerging structure despite a major impetus to the growth of non agricultural employment during this period, viz, consumer demand The paper is divided into four sections besides the introduction In Section I we discuss the relevant characteristics of Kerala's rural economy In Section II we give the empirical evidence at the state level We make an attempt to identify as far as possible the linkages between various processes and the changes that have occurred in the rural employment structure in Section III and conclude with Section IV

Kerala is a state in which the process of economic diversification was initiated much earlier and has been relatively endogenous though not strictly within the 'Kuznets-Lewisian' framework Certain specific features of Kerala's economy which have historically had an important bearing on rural diversification are (1) the pattern of agricultural development with its preponderance of commercial crops, (2) the much higher than all-India rates of population growth in the first half of the century with a rapid decline in land-man ratios from a very early period and high population densities, (3) the peculiar settlement pattern in the state confounding rural-urban boundaries and (4) the nature of its SDP growth which derives largely from the growth in the plantation sector in agriculture and the social sectors The share of manufacturing in the state's SDP is still relatively small and its growth rate has been much below the all-India average [Subramanian 1990]

That the pattern of agricultural development was a major determinant of its distinct occupational structure compared to the rest of India has been noted as far back as the beginning of this century This can be discerned from some of the secondary historical sources [Aiya 1906, Velu Pillai 1940 Menon 1967] and was brought out succinctly by the Census of Cochin 1911 as the following extract reveals

> This comparative preponderance of industrial population in these two states (Travancore and Cochin) is due not to the infertility of the soil but to certain natural advantages possessed by them which have directed a larger proportion of people from agriculture to industrial occupations Among these must be mentioned the backwaters and canals teeming with fish life of valuable forests and of the facilities for cultivation of coconut palm the raw produce of which

affords scope for extensive industries... (Census of Cochin 1911 as cited in Krishnamurty 1970).

Both topographical and economic factors in terms of a favourable export market encouraged the growth of commercial crops some of which were processed further, even while the state was deficit in food, demand for which was met through imports [Panikar et al 1977]. This resulted in relatively high levels of rural employment in agro processing (predominantly labour-intensive, low productivity industries such as coir and cashew) trade and commerce, transport and other services. The area under commercial crops increased continually since at least the 1920s with some variations given the behaviour of relative prices of food (mainly paddy) and non-food crops (primarily coconut and rubber) [Panikar et al 1977]. A recent study on the performance of the agricultural sector in Kerala suggests that there was a sharp shift further away from paddy since the mid-70s. While area under paddy grew at an annual rate of 0.8 per cent during 1962-63 to 1974-75, there was an absolute decline in area subsequently registering a negative growth rate of 2.1 per cent per annum. The gains were taken up primarily by coconut and rubber [Kannan and Pushpangadan 1988].

Hence it was a process of commercialisation (linked significantly to the external market) which explained the relatively high level of rural non-agricultural employment [Krishnamurty 1970; Sankarnarayanan 1980] rather than rapid industrialisation/urbanisation. While this did play a positive role in generating a large quantum of rural non-agricultural employment, the much higher (than all-India) rates of population growth in the first half of the century resulted in a rapid decline in land-man ratios with a proliferation of small uneconomic holdings and high population density [Krishnaji 1979]. The declining land-man ratios coupled with the low labour use in commercial crops acted as a powerful 'push' out of agriculture making the population mobile both across space and occupations. Hence the 'proletarianisation' of the workforce not totally dispossessed of land started much earlier in Kerala. However, to the extent the incidence of commercial cropping with its high valued crops was more widespread in Kerala involving a larger proportion of small landholders, the higher average productivity of land partially compensated for its small size.

The extreme pressure of population on land in the early decades is evident from the efforts of the state to settle people in sparse regions not only inside but also outside the state. Large-scale migration occurred to sparsely populated regions in the highland division within Travancore in search of cultivable land which accelerated between 1921 and 1931 and to Malabar which continued into the 60s [Tharakan 1976]. The rapid spread of literacy and growing levels of education added to the pressures for generating non-agricultural employment. The more literate persons migrated to other parts of India into non-agricultural occupations primarily in the service sector. Overseas migration did exist but the quantum jump came only in the 70s. However since both spatial and occupational diversification could not keep pace with the numbers seeking work, unemployment tended to rise primarily since the social and economic mechanisms for maintaining 'surplus' labour disintegrated much faster in this region in rural areas.

Given the peculiar settlement pattern in the state with a diffused spatial ordering of houses confounding rural-urban boundaries, rural-urban migration was relatively muted; coupled with a high population density the average size of a village was much larger in Kerala. These large villages were themselves in the nature of small towns but for the constraint regarding non-agricultural employment which were upgraded into towns with a change in their economic structure. The emergence of small and medium towns has played a much more important role in the process of urbanisation in Kerala, than in the rest of India [Sreekumar 1990]. While in the 70s almost 22 per cent of the urban population was on account of this 'extensional' component in the 80s it had increased to 32 per cent and almost 92 new towns were added in 1991 [Census 1991]. Given the relatively high degree of commercialisation, coupled with the peculiar settlement pattern in the state characterised by a rural-urban economic continuum, rural non-agricultural employment acquired sectoral-cum-spatial linkages in a very special way in Kerala.

However, the growth in the share of non-agricultural employment did not imply rapid increases in per capita incomes since product per worker was not very much higher in the non-agricultural sectors, due to low productivity especially in manufacturing [CDS 1975]. The relative under-industrialisation of the Kerala economy reflected the nature of its SDP growth which derived largely from the growth in the services sector. Nonetheless, as is well known, given the performance of the state it

the spheres of literacy, health and population control, land reforms and public distribution system, the 'quality' of life of its people has been much above the average for the country as a whole and the growth process was relatively more egalitarian [Franke 1991] However the constraints on such a process of growth have become very evident as reflected in the larger and more frequent fiscal crises in the state [George 1993] and high levels of unemployment

II

The specificities of the agrarian set up in Kerala suggest a higher level of diversification of the rural economy compared to the rest of the country as is borne out by the evidence estimates for 1987 88 show that over 45 per cent of the males and 34 per cent of the females in rural Kerala were engaged in non agricultural activities the highest among the major states of India The all India average was 25 5 per cent for males and 15 3 per cent for females However, rural participation rates were lower in Kerala, coupled with the highest rural unemployment rates In this section we examine the size and pattern of rural non agricultural employment in the 70s and 80s based primarily on estimates from the quinquennial labour force surveys of the National Sample Survey Organisation (NSSO) as also the decennial censuses We define as non agricultural workers, all workers other than those engaged in agriculture and related activities, the latter including besides crop production plantations, forestry fishing and animal husbandry It could be argued that the products of dairying and animal husbandry are highly income-elastic and, not being particularly land-intensive, could qualify as non-agricultural activities In terms of policy too it might be more practical to view these activities as non agricultural, being part of programmes for supplementing agricultural incomes However we continue to include animal husbandry as an agriculture-related activity since it is still largely organised on a household basis primarily using female labour [George and Nair 1990]

I Data Base

The problems of inter-censal comparability due to definitional/conceptual changes in respect of worker are well known, impacting significantly on female workers, for whom work and non work can be indistinguishable, especially in rural areas Until the estimates thrown up by the NSS surveys are by and large comparable, these are not entirely free of problems (as we discuss later) and considerable research has gone into delineating comparable long-term series for each of these sources as also the possibilities of combining the two [Krishnamurty 1984 Bhalla 1985, Unni 1989 Chandrashekhar 1993] It is generally accepted that the NSS methodology and concepts ensure a better enumeration of the workforce, in particular of females and through its various other correlates, enriches our understanding of the employment/unemployment situation in the country The NSS provides three alternative estimates of employed/unemployed, varying with the reference period adopted the usual status, current week and current day status [NSSO 1990] However some of the limitations of the NSS data are well known the first of which is very pertinent to Kerala

(a) The adoption of a relatively more restrictive definition of usual status worker in the 2nd quinquennial round (viz, 32nd round), introduced a comparability problem with the 27th Round estimates However, since the subsidiary activity of those usually not working (including the unemployed) was also recorded the clubbing of subsidiary with usual principal status workers, produced an estimate closely corresponding with the 27th round estimates But it is essential to point out that while this was true at the all India level, by sex and residence, and for certain states, with respect to a few, including Kerala, the inclusion of subsidiary workers, particularly females in rural areas, resulted in large variations in the proportion of workers over time [Sundaram 1989] And to the extent that the subsidiary workers are specific to certain sectors, their inclusion or exclusion would tend to introduce some ambiguity in the inter-sectoral shifts in employment over time The question is Are these changes real or can they be dismissed as largely illusory given the arbitrariness involved in distinguishing work from non-work for females

(b) A disaggregation of the workforce by industrial activity, which is our main focus is not available for 1972-73 at the state level nor is the industrial distribution of subsidiary workers available for 1977-78

(c) NSS surveys do not provide any disaggregated estimates below the level of the state except for 56 regions into which the major 15 states were divided Districtwise analysis has to be based on the census data

With these limitations in mind, what sort of compromises can we make on quality of data to obtain a comparable series since the early 70s on level of employment and its pattern

First, overall trends in aggregate level of employment by sex and residence and its break up broadly into agriculture and non agriculture can be examined in terms of the usual principal and subsidiary status (hereafter UPSS) workers based on the NSS surveys of 1972-73 (27th Round), 1977-78 (32nd Round), 1983 (38th Round) and 1987-88 (43rd Round) However, given the large variations in the level of employment with the inclusion of subsidiary workers specific to agriculture, we analyse trends in aggregate level of employment and the more detailed pattern of

employment in non-agricultural activities based on usual principal status (hereafter UPS) alone starting with 1977-78 This means that some comparable (to UPS) estimates of the workforce and its industrial distribution is necessary for the early 70s We broadly fill this gap by using the 1971 census estimates The latter had used a restrictive definition of worker which appears to match fairly well with the UPS estimates of 1977-78 with the usual caveat regarding female workers Hence our analysis of the level of employment and its pattern is based on both UPSS and UPS, the latter starting with 1971 This paper analyses trends in the size and composition of rural non-agricultural employment for the state as a whole

State Level Analysis

While the share of non agricultural employment in rural areas has historically been higher in Kerala, there was in fact a decline in the early 70s unlike at the all India level, followed by a substantial increase by the latter half of 80s However, if the subsidiary workers, or those who are only partially employed, are excluded the share of non agricultural employment rises sharply in the early 70s and increased steadily since then (Table 1) The proportion of subsidiary workers was very high in 1977 78 particularly in respect of females most of whom tended to be concentrated in agriculture-related activities, primarily livestock production Subsequently there was a sharp decline which continued into the 80s Hence the sharp variations in extent of subsidiary work affects the inter sectoral shifts in employment The question is Are these large variations in the proportion of subsidiary workers real or illusory?

That a large increase in female employment in this activity was warranted during this period is supported by other evidence at the state level An intensive study on the Livestock Economy of Kerala revealed that the early 70s marked a spectacular increase in demand for milk in Kerala which gave a big boost to the diffusion of cross-breeding technology as part of the Intensive Cattle Development Project in the country Returns from milk production were high as price movements were in favour of milk *vis a vis* cattle feed prices Cattle keeping became more broad-based in the 80s with participation of small holdings and females constituted almost 62 per cent of the labour used, spending on average four hours per day per animal There was a substantial increase in the female bovine population between 1972 and 1987 [George and Nair 1990] Hence an increase in female participation in this activity was warranted, however the increase in female workers was much higher than the rate of growth of female bovine population between 1972-73 and 1987 Nor was this increase in female subsidiary employment sustained in the two subsequent rounds and by the late 80s there was a shift in its composition towards self employed in non-agriculture

The high proportion of subsidiary workers in Kerala is not entirely unexpected in a rural economy characterised by high rates of open unemployment (highest among the major states of India) Perhaps this is one of the reasons why subsidiary work varies in tune with variations in the unemployment rates over time (See Table 2 All three rates of unemployment corresponding with the employment rates are given in the table) An analysis of the UPS rates shows that unemployment was indeed very high in 1977 78 when the proportion of subsidiary activity was very high particularly for females The unemployment rates fell in 1983 and the extent of subsidiary activity also declined however, in 1987-88 when unemployment rates increased for both males and females the participation of women in subsidiary economic activity declined further To some extent the decline could be on account of the changing scenario on the livestock front with sharp increases in concentrate feed prices and decline in the profitability of milk production since the mid-80s [Tara Nair 1990], inducing some withdrawal of males and females However, another interesting feature of the estimates is the sharp decline in male current daily status (CDS) unemployment rate in Kerala in 1987 88 which could have induced some withdrawal of females from subsidiary economic participation This of course, would depend upon whether the increase in the number of days of work for males added sufficiently to the household income The relationship between unemployment and participation in subsidiary economic activity therefore is more complex than a simple linear relationship However that it is a specificity of the Kerala employment situation cannot be denied Hence while there is an element of arbitrariness in the enumeration of female subsidiary workers, the erratic behaviour is not entirely irrational and the large variations cannot be dismissed as illusory

However to the extent that such a large proportion of subsidiary workers are engaged in agriculture their inclusion/exclusion makes a significant difference to

the trends in non-agricultural employment since the early 70s as indicated earlier While the UPSS estimates of the proportion of rural non-agricultural employment show a decline for both males and females between 1972-73 and 1977-78, from 44 3 per cent for males and 41 4 per cent for females in 1972-73 to 40 8 per cent and 30 9 per cent respectively in 1977-78, the UPS estimates suggest a consistent increase in its share since the early 70s for both males and females (though the increase for females between 1971 and 1977 78 could to some extent be on account of underestimation of female workers in agriculture in 1971) There is a marginal increase in the share of non-agricultural employment both in terms of UPSS as also UPS between 1977-78 and 1983, which is muted primarily on account of females The increase in the 80s is evident for both UPSS and UPS It may be noted that in respect of all-India, the share of non agricultural employment in rural areas rose steadily between 1972 73 and 1987 88 However, both for Kerala and India the intersectoral shift was sharper in the 80s than in the 70s

The census estimates of the non agricultural workforce are higher primarily on account of an undercount of female workers in agriculture and show a steady increase since 1961 from 34 7 per cent to 42 71 per cent in 1991 (for both males and females) in Kerala

It may be noted here that growth in rural non-agricultural employment is understated to the extent that over time some rural areas get included in urban areas which is more pronounced in Kerala given the nature of its settlement pattern and the urbanisation process In Kerala the increase in urban population due to the emergence of new towns has played a relatively more important role [Sreekumar 1990] Hence if one were to standardise the rural occupational structure for the changes in level of urbanisation on account of the upgradation of rural areas, the proportion of non-agricultural employment would be much higher At the same time the data would overstate rural non-agricultural employment, more so than at the all-India level since a larger proportion of the rural workforce could be employed in non-agricultural activities in nearby urban/commercial areas given the ease in commutation This also means, as pointed out elsewhere [Chaddha 1994], that inferences on the changing pattern of rural production base cannot be gauged from the changing pattern of rural employment

The question is are these changes in the pattern of employment, in particular the increase in female subsidiary workers and the shift towards non-agriculture, demand induced or simply a reflection of the tremendous push out of agriculture which started much earlier in Kerala and is more severe The answer to this question would have been simple if corresponding data on levels of earnings in each of these activities was available However, available data on earnings are rather limited and before we use these data to evaluate the situation with some confidence we have to probe further into (a) the pattern of agricultural and non-agricultural employment in greater detail (b) status of employment, and (c) education and employment

(a) Pattern of Employment

Given the substantial changes in employment pattern within agriculture itself and related activities in Kerala, reflecting to some extent the cropping pattern changes in the 70s and 80s and the tremendous thrust to livestock development, we briefly examine first the changes in the pattern of agricultural employment using UPS estimates, the proportion of subsidiary workers in these activities is also given (Table 3)

It is interesting to note the sharp decline in employment in crop production for males since 1977-78 while for females the decline becomes very sharp later The proportion of male workforce engaged in crop production is now vey low viz only 16 per cent compared to the proportion in plantations which is almost double at 31 per cent Crop production appears more as a subsidiary activity for males There is an equally sharp increase of employment in plantations primarily in rubber and coconut for men and fruits orchards and tea for women While employment in livestock on UPS is relatively small and has declined an overwhelming proportion of persons particularly females are engaged in it as a subsidiary occupation However, this proportion declined rather sharply for males in 1987-88

Turning now to the pattern of non-agricultural employment, we examine the changes at the broad (one digit) industry level using the UPS estimates (Table 4)

What strikes one immediately is (a) the shift towards non-agricultural employment in urban areas has been negligible at least up to the early 80s; and (b) in rural areas the sectors which contributed the largest shares in non-agricultural employment have grown the slowest (growth rates not given in the table). Manufacturing which constituted the single largest rural non-agricultural sector grew modestly for males in the early 70s (the female data not being very reliable for 1971) but since 1977-78 its rate of growth has been negative. It accounts for about 10 per cent of total rural employment in 1987-88. The decline has been overwhelmingly on account of the major traditional industries in Kerala, such as coir and cashew, impacting on female workers, while growth in industries based on intermediate products (Div 3) has been fairly high, around 5 per cent per annum (starting of course from a small base). Its share in the manufacturing sector has increased in the 10-year period 1977-78 to 1987-88. In the 80s the share of manufacturing for females has steadied at around 24 per cent primarily due to expansion in employment opportunities in other primary resource-based industries such as food products and ready made garments.

Services (community, personal and social) which is the next largest sector had a growth of less than 1 per cent per annum, and its share is now about 8 per cent of total employment though for females the growth was higher. On disaggregation (data not given here) a striking feature is the sharp increase of female employment in public administration, education and health. Most of the other groups in the tertiary sector recorded fairly high rates of growth—transport and communication, a growth rate of 4.7 per cent and trade and commerce even higher at 5 per cent per annum; the latter now contributes the largest share in total rural and non-agricultural employment, 13.2 per cent and 28 per cent respectively. Most of the growth in trade is due to a phenomenal growth in retail trade of a large range of manufactured goods such as textiles, household durables, medicines, books, and intermediate products, the production of which is hardly reflected in the structure of manufacturing. Almost the entire requirements are brought in from other states.

The highest growth was recorded in the construction sector, employment in which grew at a rate of over 8 per cent per annum, which is largely attributed to the housing boom in Kerala consequent upon the gulf boom since the mid-70s. Employment growth in electricity, and finance has been high too, between 6 and 8 per cent, however, their shares are relatively small. However, the impact of growth in construction activity on manufacture of building materials is negligible.

The changes in the rural employment pattern are more revealing if we examine the percentage distribution of the increments to the workforce between 1977-78 and 1987-88 divided into the two sub-periods 1977-78 to 1983 and 1983 to 1987-88 (Table 5). These data have been given for both rural and urban areas which also

Sources: NSS, 32nd Round, Report of the Second Quinquennial Survey on Employment, No 298/10, July 1983. *Sarvekshana*, Results of the Fourth Quinquennial Survey on Employment for nine major states, NSS 43rd Round, Vol XVI, No 2, October-December 1992.

enables us to identify the fast growing areas of employment. It is interesting to note from the table that while in the first sub-period agriculture absorbed the largest proportion of the additions to the workforce, subsequently, there was an absolute decline in the numbers engaged in agriculture for both males and females. Hence the increase in rural non-agricultural employment in the 80s is composed of the new entrants into the workforce during that period as also some who moved away from agriculture. This certainly did not occur at the all-India level except for women, to a lesser extent in the 80s [Chadha 1994]. What needs to be underlined is that the share of manufacturing in the incremental workforce was negative for males in both the sub-periods in rural areas and positive and almost similar in urban areas. However female employment in rural manufacturing which declined very sharply in the first sub-period gained in the second sub-period while in the urban areas the increase was marginal. Other interesting recent changes were a high absorption of females in agriculture-related activities in urban areas and in social, personal services in rural areas. Hence we find that within the non-agricultural sector growth was higher in the tertiary sector and accelerated in the 80s. Though these trends are broadly similar to the all-India pattern there is a striking difference, viz, at the all-India level the share of manufacturing in rural employment has increased since the early 70s even while the larger gain was made by the tertiary sector [Papola 1992]. The ratio of tertiary sector employment to the other two sectors—primary and secondary—for males increased from about 0.30 in 1971 to 0.32 in 1977-78, to 0.35 in 1983 and sharply to almost 0.40 in 1987-88 in Kerala. At the all-India level the ratio was much lower and its growth was gradual, it increased from 0.10 to 0.12, 0.14 and 0.16 respectively over the same period.

While the long-term tendency of a shift towards non-agricultural employment in rural areas (despite a decline in the early 70s) does imply a qualitative improvement in the rural employment situation, the overwhelming growth in the tertiary sector and the marginal contribution of manufacturing even in urban areas has generated a lopsided occupational structure. Moreover, changes in the mode of employment do not prima facie suggest a qualitative improvement in the employment situation.

(b) Status of Employment

Table 6 brings out the changes in employment status UPSS, since 1972-73 and in terms of UPS since 1977-78. Given the relative increase in the share of agriculture related activities in Kerala between 1972-73 and 1977-78, there was an increase in the share of self-employment initially. While it declined subsequently for males, and a little later for females, it was primarily in agriculture. The proportion of self-employed in non-agriculture increased between 1983 and 1987-88 both for males and females more sharply for the latter. Hence the decline in self-employment has been much more gradual in Kerala. There was a clear upward trend in male casual employment though not so for females. The former was primarily on account of non-agricultural work; in respect of females the decline in agricultural work was rather sharp. While regular employment reveals a downward tendency for males, it is mildly upwards for females in non-agriculture. Hence for males casual employment in non-agriculture steadily rose in the 70s at the expense of self-employment, while in the 80s it was at the cost of regular employment in non-agriculture. For females the broad trend was an increase in the share of self-employment and regular work up to the early 80s. However in the 80s there appears to be a tendency towards casualisation of the female workforce in non-agricultural activities with little change in the proportion engaged in regular work. Hence the 80s mark a pronounced casualisation of rural labour, both for males and females.

Since the decision to engage in non-agricultural activity in rural areas is to a large extent determined by land ownership besides changing job aspirations with increasing levels of education, it would be interesting to examine the mix of activity—agricultural or non-agricultural—by size distribution of land (Table 7). These data also enable us to capture the varying involvement of rural households in wage labour *vis-a-vis*, self-employment depending on the size of land cultivated.

Some striking features of this table need to be emphasised (a) As the farm size increases, the incidence of non-agricultural employment declines from about 61 per cent to 11 per cent, but rises to 14 per cent in the highest farm size; (b) Within agriculture, as farm size increases the proportion of self-

Source: Same as Table 1.

employed households increases Even in a holding size between 0.41 to one hectare, over 80 per cent of the households are self-employed With a farm size above two hectares, very few households engage in wage labour, (c) Within non-agriculture with an increase in land size the proportion of households self-employed in non-agriculture is much smaller and increases only mildly to 46 per cent up to 4.0 hectares, but the share of 'other households' rises quite sharply However in the highest farm size there is a sharp increase to over 80 per cent of self-employed households and an equally sharp fall in 'other households' The proportion of non-agricultural wage labour is more or less the same as the proportion self-employed in the bottom two landholding classes, but falls sharply thereafter and is non-existent in the last two size class holdings

Given such a pattern it would appear that the decline in the proportion of self employed in agriculture implies that the proportion of households in the smaller size classes is increasing throwing the people into wage labour primarily in non agriculture It could also be that the small and marginal cultivators are increasingly resorting to non agricultural wage labour due to better earnings or unwillingness to engage in agricultural work, on own farm or others farm This interesting insight into the rural labour market in Kerala has been captured in some micro-level studies [Shaji 1980 Jose 1991] and assumes importance in the context of the reported high rates of rural unemployment in the state It is attributed primarily to the rising levels of literacy which raises income/job/status aspirations of the younger job-seekers as also the sharp increases in wage rates of certain types of non agricultural work, e g, construction of loading/unloading

(c) Education and Non-Agricultural Employment

Kerala is well known for its historically high and expanding levels of education, in rural areas too resulting in a much higher proportion of population reporting as students While almost 31.6 per cent of males and 26.5 per cent of females in rural areas were recorded as students in Kerala in 1987-88, the proportions were 19.2 per cent and 10.8 per cent respectively for all India [NSSO 1990] This has impacted on the labour market by depressing participation rates to some extent [CDS 1975] and added to the pressures for generating non agricultural employment for the new entrants into the workforce In Table 8 we examine the educational background of rural workers

The most striking feature of the table is the low level of illiteracy among rural workers in Kerala unlike for India, even in agricultural work While almost 54 per cent of the male workers in agriculture were illiterate at the all India level the proportion was 14 per cent in rural Kerala [NSSO 1990] Female illiteracy is almost double of males more so in non agriculture but much lower than the country as a whole As is to be expected the proportion of illiterate workers in non agriculture is much lower and the proportion of educated workers, viz, secondary level and above is overwhelmingly higher in non agriculture While almost one fifth of the male agricultural casual workers are illiterate (38 per cent for females) the proportion is less than 10 per cent in non agriculture for males though not much less for females Those with middle level constitute about 33 per cent of casual workers in non agriculture which is more than double that in agriculture The difference is striking in regular employment over 50 per cent of males are secondary and above in non-agriculture compared to about 5 per cent in agriculture. In respect of females the agriculture, non-agriculture difference in higher education is even sharper almost two-thirds in non-agriculture regular employment compared to 11 per cent in agriculture Hence education not only facilitates but also enables a shift from agriculture to non agriculture An idea of the change that has occurred in the educational levels of different occupations is provided with similar data for 1977-78 though such a comparison is to some extent vitiated due to the inclusion of persons of age 5 14 years in the 1977-78 However, since only 2 per cent of males and 3 per cent of females are workers in this age group, we can make some broad comparisons with the proviso that the incidence of less educated/illiterate workers would have been overstated to some extent in 1977-78 It is interesting to note the changes in the educational background of agricultural and non-agricultural workers from the middle-level onwards For males while the increase in the level of education is most dramatic for self-employed particularly in non-agriculture the differences come out sharply in respect of casual labour the proportion of those with middle level more than doubled in non agriculture and the increase in the share of those with secondary-level was also higher, in non agriculture A small proportion of graduates also are now engaged in non-agricultural work In regular employment the proportion of workers with a secondary-level has not changed in agriculture while in non agriculture the increase is substantial, the share of graduates and above has almost doubled With respect to females too the educational levels have risen faster for non-agricultural work except for a very slow decline in illiteracy among non-agricultural

labourers. While overall there is an upgradation of educational levels for all categories of employment in agriculture and non-agriculture the sharper increase in the latter suggests a greater absorption of the more literate new entrants into non-agricultural activities. The sharp rise in the proportion of educated in self employment in non-agriculture is an adjustment mechanism in a situation of sluggish growth in regular employment opportunities which is the desired type of work.

Drawing together the evidence on changes in the pattern, status and educational level of employment it would appear that barring certain categories such as social and community services (public administration, education and health) banking and finance, in which employment is generally regular most of the increases in employment under trade and commerce, construction, private transportation and even manufacturing (given the growing relative preference for males) is of a casual nature or some form of self-employment. While educational levels of both categories has increased particularly in respect of self-employed workers, some idea of a qualitative improvement in the situation can be obtained only by an examination of the relative earnings in the different occupations.

(d) Earnings and Levels of Consumption

Most of the studies on rural wage rates in Kerala emphasise the growth in real wage rates of almost all categories of workers in particular agricultural and construction labour. While the former is attributed to unionisation among agricultural workers the latter is argued to be a consequence of the sharp increase in the demand for construction workers due to the construction boom initiated by remittances from the Gulf migrants, further reinforced by outmigration of a substantial proportion of construction workers.[1] Kerala is the only state in which wage rates doubled between 1960 and 1990 [Krishnan 1991]. It has been convincingly argued by Krishnan that this impacted on other related wage rates of agricultural and unskilled non-agricultural workers through the operation of a 'parity' norm thus causing an all round increase in real wage rates despite a high and rising level of rural unemployment. However, gender wage differentials widened. Table 9 gives data on real wage indices for agricultural labour and skilled, unskilled construction labour since the early 70s. The NSS also brings out some data on earnings for casual agricultural and non-agricultural labour which we examine in Table 10 over the ten-year period 1977-78 to 1987-88. Looking at Table 10 we find that in the initial year daily earnings of male casual non-agricultural worker was not very different from that of an agricultural worker's earnings; but growth in the former was higher; the ratio of non-agricultural/agricultural wage increased from 1.01 in 1977-78 to 1.13 in 1987-88. A striking feature of the table, also seen in the wage data given in Table 9, is the lower (than agriculture) wage rate for females in non-agriculture in 1977-78. However, despite a high growth of earnings in non-agriculture resulting in a sharp narrowing of the differential from 0.76 to 0.94, non-agriculture wage for females remains below the agricultural wage in 1987-88.

It must be remembered that number of days of employment for agricultural labourers and to a lesser extent for non-agricultural labourers too, had been consistently declining as is brought out by the Rural Labour Enquiries of 1964-65, 1974-75 and 1983 (Department of Economics and Statistics 1985) which could to some extent have nullified the increase in daily earnings. However, it is observed that despite the decline in employment there was a significant increase in real incomes of rural labour households, agricultural and non-agricultural, during the period 1964-65 to 1983, though less than the increase in real wage rates. The income of non-agricultural households is higher and the increase was sharper for non-agricultural households between 1974-75 and 1983. Moreover by 1987-88 there was some reversal of the declining trend in days of employment with an increase in the number of working days per day per 100 persons from about 40.6 for males and 13.8 for females in 1983 to almost 49 for males and 17 for females by 1987-88.[2] Hence the above comparison of the level and trends in relative earnings of agricultural and non-agricultural labour suggests an increase in the demand for non-agricultural labour as also its supply. This was not merely an investment demand for construction but derived also from a substantial growth in consumption demand for goods and services since the latter half of the 70s.

An indepth study on consumer expenditure highlights the fact that while per capita consumer expenditure in rural areas in Kerala was lower than for all-India in the early 70s it rose more rapidly and by the late 70s had surpassed the national average. In 1987-88, per capita consumer expenditure was Rs 211.47 in Kerala; the average for the country was Rs 158.10. Indeed it appears that since 1983 per capita expenditure for the state was higher than the estimated per capita domestic product. This would be applicable to rural areas too since there is a growing convergence of rural-urban consumption patterns in Kerala (Sunny 1988). Moreover, there was an increasing trend towards diversification of expenditure with an increase in the share of non-food items in the total from about 29.5 per cent in 1972-73 to 40 per cent by 1987-88. While the average expenditure on services and durable goods in rural areas was about Rs 38.8 and Rs 13.3 in Kerala in the last year under study, in India it was Rs 22.8 and Rs 5.6 respectively. That this increase was not primarily on account of growing inequalities in consumption was borne out by an almost constant Lorenz ratio over this period [Thomas Issac 1993]. What is of interest to us is the considerable diversification of consumer expenditure in Kerala both within food and non-food, in particular the growth in services since the second half of the 70s and that it was reasonably broad-based. Hence we focus on the consumption shares and pattern of expenditure of the bottom 30 per cent of the rural population between 1977-78 and 1987-88 (Tables 11 and 12).

A striking feature of Table 11 is the increase in the share of the bottom 30 per cent of the population in almost all commodity groups, including not only cereals but items such as milk, meat, fish and eggs, as also vegetables in the food

category. The share of non-food items has increased faster than at the all-India level, from about 9.1 per cent to almost 14 per cent in Kerala compared to 8.7 per cent and 11.4 per cent for all-India; the share in miscellaneous goods and services grew from 10 per cent to 14 per cent while for all-India the increase was from 8 per cent to 11 per cent. However the share in durables has not grown similarly reflecting perhaps greater inequality in its consumption. Needless to say this implies a substantial growth in average per capita expenditure on each of these items, seen from Table 12. It shows a discernible increase in the ratio of consumption of the bottom 30 per cent of the population to mean consumption for not only cereals but other items of food and non-food. Among the non-food items the growth in consumption of services has been fairly high in Kerala.

III

From the emerging rural employment situation examined above, we attempt to identify some broad causal factors in an attempt to explain the changes observed. There was a distinct growth in derived demand for labour in the secondary and tertiary sectors given the substantial increase in demand for consumer goods and services. That growth in the tertiary sector was higher than in manufacturing not only since expenditure elasticities for the former are generally higher but also because manufacturing has lagged far behind, was evident from an analysis of the changes in the industrial distribution of the workforce. While retail trade in food products such as grain, grocery, vegetables, fruits, fish, poultry, bakery products, and a whole range of non-food items such as textiles, household durables, medicines, books and intermediate products such as building materials, increased substantially, very little was manifested on the production front except for food products and ready made garments. Some marginal diversification into Div 3 industries took place. The impact of the tremendous increase in residential construction in stimulating the manufacture of building materials such as cement, iron rods, electrical and sanitary goods was negligible. And despite the sharp increase in area under rubber and growth in its production its manufacture into industrial products was extremely low (George and Joseph 1992). While some part of the increasing diversification of food demand such as milk, eggs and meat was met from within the state as reflected in the production of these commodities and hence an initial increase in agriculture-related activities with increasing prosperity, it was not sufficient and almost the entire requirement of manufactured non-food items, as also the above food items including vegetables, milk, eggs and edible oil were being imported from outside the state. Hence the import intensity of consumer expenditure rose considerably resulting in a widening of trade deficit for the state from Rs 364 crore to Rs 861 crore between 1975-76 to 1980-81 [Isaac and Reddy 1992]. The import of building materials increased from Rs 85 crore in 1975-76 to Rs 292.3 crore by 1980-81. On the other hand export of raw rubber increased from about Rs 75 crore to Rs 160 crore. This tremendous increase in trading activity generated considerable expansion in trade and commerce and transportation for procuring and distributing the commodities, not to speak of the need for enhanced financial services, strengthening also rural-urban linkages. Hence the process of commercialisation was intensified; while earlier it was geared primarily to the external market, a significant proportion of trade, commerce and transportation was now catering to the needs of increased internal demand. Growth in demand for services such as education and health was also reflected in the employment structure.

Hence growth in consumer demand was a major stimulant to the diversification of rural activities in Kerala; however, most of the impact was on the tertiary sector. While it is true that in most other developing regions of the world too, a large part of the decline in the share of agricultural employment is taken up primarily by the tertiary sector [Syrquin 1988] and linkages through the consumption of manufactured goods tend to be low in rural areas, their absence in the urban areas too in Kerala created a weak employment base. Moreover the continuing increase in the share of the state's working force in the tertiary sector, not readily attributable to any impulse generated in the commodity producing sectors, makes Kerala's occupational structure rather lopsided. Of course, given the fact that man/woman power, both highly educated and otherwise, has itself become a 'commodity' in Kerala, the 'export' of which registered phenomenal increases since the first half of the 70s, the growth in services is not so unrelated. However, the sustainability of such a tertiary sector-led growth in the long run is questionable.

IV

Hence broadly it can be stated that part of the changes in rural employment in the 70s and 80s in Kerala were demand-induced and part a strategy for survival in a situation where an increase in consumer demand could not be translated into a significant expansion of non-agricultural employment opportunities in rural areas even given the advantage of a rural urban continuum in Kerala.

We find then a rather paradoxical situation wherein the employment structure in rural areas does not show any significant overall improvement but rural prosperity has increased, also among casual workers. This is reflected in the higher than all-India levels of per capita consumption which have grown and diversified on average as also for the bottom 30 per cent of the population. While migration to the Gulf still holds out as the best alternative for most people, given the persistence of high rates of unemployment, in particular educated unemployment, it is imperative to hasten the speed with which non-agricultural employment on a regular basis can be generated within the state. It is in this context that the promotion of modern small/medium scale industries assume importance as a policy instrument for a sustained process of economic diversification of rural areas. While a number of studies have questioned the sustainability of rural industries over time with increasing incomes and increasing market integration, there are also instances where initiatives to set up such enterprises have succeeded [Uribe-Echevarria 1991]. Kerala has the advantage of early development of the rural infrastructure including banking,[3] high rural population densities and a more urban-like environment which as empirical evidence reveals, facilitate the growth of small-scale firms. In fact the proportion of small-scale industries in rural areas is much higher in Kerala as compared to the rest of the country [Subramanian and Pillai 1993]. Indeed, the impetus for the growth of these enterprises may not be the immediate local demand; however they would have a crucial link with rural areas in the form of supply of capital and labour. The potential for the former is very high as evident from the phenomenal increases in deposits with the banks while the credit deposit ratio remains very low. The sources of raw material and fina markets may lie outside the rural areas. A field survey we had undertaken does lend credibility to such a scenario—for instance the growth of the diamond cutting industry in certain taluks of Trichur district. In addition with soaring land prices in urban areas or other industrialised regions locations away from such areas would have a relative advantage—for instance large areas being reserved for factory sites in Kanjikode area of Palghat on the Palghat Coimbatore road.

The generation of an appropriat environment for the promotion of small scale industries is not so simple, despit Kerala's advantages, as is evident from th lacklustre success of the high pressure stat efforts to promote small- and medium-scal industries. The problem is aggravated by th education structure biased as it is toward general education with relatively much les emphasis on technical/vocational trainin which has also shaped job aspiration favouring white collar occupations. Th

has to change. Very recent data, collected in the course of our field study show that some amount of industrialisation has occurred in rural areas with the emergence of new pockets of industrial growth as in Trichur, Palghat and Cannanore, besides the older Ernakulam—Alwaye-Kalamassery belt. How this can be strengthened with a greater emphasis on decentralised planning has to be given serious thought.

Notes

[This study is part of a larger project on Rural Non-agricultural Employment in Kerala sponsored by the Indo Dutch Programme on Alternatives in Development (IDPAD). In writing this paper, I have been much influenced by the work of A Vaidyanathan, Praveen Visaria, G K Chadha, Jeemol Unni, Rakesh Basant, D Jayaraj, Ashwini Saith and F U Echevarria and may not acknowledge them sometimes specifically. I have also benefited from useful discussions with my colleagues, D Narayana and S Sharma while writing the paper, and from A Jayakumar for his unstinting research assistance.]

1 In fact workers were brought in from the neighbouring state of Tamil Nadu. See Gopikuttan (1990).
2 As given in the various NSS Rounds
3 Kerala for instance ranks first in a number of infrastructural and basic facilities in villages. See Franke and Chassin (1991)
4 This has been a major cause for concern in Kerala. See for instance Thomas Isaac (1993).

Calculating the Fiscal Deficit

A Note on Certain Capital Receipts

I S Gulati

It is necessary to be clear about what to include or exclude in the calculation of the fiscal deficit if the concept is to be of use for economic analysis or as a policy tool. This note attempts to clear some doubts about certain capital receipts, particularly proceeds from disinvestment in public enterprises.

AS a concept, the fiscal deficit is too aggregative to be of much use for economic analysis or as a policy tool. However, since it has now started being used extensively and that too as a major yardstick to measure the success or otherwise of the government's macro-economic, including budgetary, operations, it is only right that we should be clear about what to include or exclude in the calculation of the fiscal deficit. This note is an attempt to clear some doubts in regard to certain capital receipts, particularly proceeds from disinvestment in public enterprises.

The concept of fiscal deficit is quite simple in that it is the excess of total government expenditure over the current or revenue receipts of the government. Still, there is a problem in calculating this excess. The problem arises principally because of doubts with regard to the treatment of government's transfer receipts and payments on the one hand and its loans and recoveries on the other, the former on revenue account and the latter on capital account. In both cases the government does not have to engage directly in purchase or sale of goods and services. There is a difference however. In the calculation of the fiscal deficit, revenue account transactions of the above type, be they transfer payments or receipts, get accommodated (either directly by adding them on to each side, i e, payments to current expenditure and receipts to current receipts or indirectly by netting the expenditure on transfer payments by the amount of transfer receipts during a year). But when it comes to capital account, while the loans and advances get reflected in the capital expenditure, the recoveries of past loans and advances can only be accommodated if the expenditure on this score is netted for the amount received by way of recoveries in the calculation of the fiscal deficit. The procedure adopted by the government of India tries to overcome the problem by allowing separately for recoveries of loans and advances in the calculation of the fiscal deficit but without netting the amount given away as loans and advances which appears on the expenditure side as a gross figure. The same procedure is adopted for the amount received as sale proceeds of public sector equity which the government has started unloading since 1991-92 (Table 1).

Strictly interpreted, since fiscal deficit is the excess of total government expenditure, i e, expenditure on revenue and capital accounts taken together, over government's current revenues, no item of receipts on capital account should be allowed for in the calculation of fiscal deficit. The fact remains however that, as stated above, in the actual calculation of the fiscal deficit in the budget papers of the central government some items of capital receipts are taken into account in addition to the receipts on revenue account for being set off against total government expenditure. The items of capital receipts thus taken into account are two: (1) Recoveries of Loans and (2) Other Receipts. It should be added that while the former accommodates recoveries of loans extended by the centre to states, public sector enterprises, etc, the latter accommodates government's realisations from the sale of public sector equity. Indeed that is the only receipt it currently accommodates.

For 1994-95, the amounts provided for in the central budget are Rs 6,700 crore and Rs 4,000 crore respectively as Recoveries of Loans and Other Receipts (Table 1) As a proportion of the anticipated fiscal deficit of Rs 54,915 crore for 1994-95, these sums would work out to 12.2 per cent and 7.3 per cent respectively. In other words, if the strict definition of fiscal deficit were adhered to, the figure would be higher by 14.5 per cent, at Rs 65,615 crore, which as a proportion of GDP would work out to 8.3 per cent (on the assumption that GDP in current prices will grow at the rate of 12 per cent made up of 8 per cent inflation plus 4 per cent real growth during the year). Obviously, the amounts set off against total government expenditure are not small and therefore the questions and doubts being raised in this regard have got to be met.

Interestingly, questions and doubts about the manner of calculating the fiscal deficit have concentrated on the sales realisations of public sector equity to the virtual exclusion of the other item of capital receipts, namely, recoveries of loans, which has

been significantly higher not only in 1994-95 but also during the preceding three financial years (Table 1). The possible explanation for not objecting to taking account of the Recoveries of Loans in the calculation of fiscal deficit could be that since the sizeable amount given away by way of loans and advances is shown as expenditure, not to allow for recoveries of past loans, which is an ongoing process, would tantamount to overstating government expenditure on this account.

But then the question cannot be avoided whether the nature of the amount realised by way of public sector equity is so very different as to be treated in a manner other than what the government realises as recoveries of loans. Are not sales realisations of public sector equity in the nature of recoveries of amounts invested by the government in public sector undertakings? Interestingly, even in 1994-95, not only is there a budget provision of Rs 637 crore for loans to public enterprises but also substantial provision is made for what is referred to in the budget documents as 'Investment in public enterprises'. The gross provision made for this purpose according to the central budget for 1994-95 is as large as Rs 50.1 thousand crore, of which an amount of Rs 7.2 thousand crore is provided by way of budget support. The corresponding provision of budget support in 1993-94 (revised estimates) adds up to Rs 7.5 thousand crore as against a gross provision of Rs 43.9 thousand crore (Table 2). Of the budget support of Rs 7.2 thousand crore in 1994-95, contribution to equity is put at Rs 3,664 crore; the balance will be in the form of plan loans to public enterprises. Thus, from the point of consistency, if recoveries of loans are allowed to be set off against total government expenditure for the calculation of fiscal deficit, there should not be any objection to treating sales realisations of public sector equity similarly.

One could also look at the issue from another angle. The fiscal deficit, being the excess of total government expenditure over the current receipts of the government, indicates the total amount the government must borrow in the course of a fiscal year. From this angle, the amounts the government realises by way of recoveries of loans or investments have to be allowed for before arriving at the amount the government has to raise in current borrowing in order to meet its total expenditure in a year. The need for the government to borrow is lower, the larger are its recoveries during a year.

What sort of loans the government raises for the purpose as part of its borrowing programme is a different question. A government may borrow externally as well as internally. The ratio between the two may vary over time. Furthermore, the internal loans a government raises may be of different types, each with its own distinct macro-economic impact.

A question can still be raised whether capital receipts of the type discussed above, namely, recoveries of loans and sales realisation of public sector equity should be allowed for, as at present, in the calculation of the fiscal deficit when such recoveries/realisations in a year exceed the corresponding outgo during the year, even though such an excess would go to reduce the amount the government must formally borrow during the year. In both 1993-94 (revised estimates) and 1994-95 (budget estimates) the recoveries of loans and advances exceed the outgoes on that account, though by small amounts of Rs 571 crore and Rs 536 crore respectively (Table 2). This, as can be seen from Table 2, is not quite so with regard to public sector equity if we take account of the total budgetary support to public enterprises. Budgetary support towards public sector investment exceeds recoveries in the form of sale of public sector equity in 1993-94 and 1994-95. However, if we take note of only the contribution to equity out of the budget provision, then sale proceeds of public sector equity during 1994-95 (Rs 4,000 crore) will exceed the contribution to equity (Rs 3,664 crore). One could even hypothesise an extreme situation when the government is selling off equity in public sector undertakings but not making any new investments in such undertakings. In such a situation, the amount thus realised would legitimately be considered in the nature of government receipt that should be taken to raise and not reduce the fiscal deficit because such receipt itself takes on the nature of borrowing, in the sense that the amount thus received, like other amounts the government borrows, goes towards the financing of current government expenditure.

As far as the concept of fiscal deficit is concerned, being far too aggregate a measure it is unable to help answer the questions one would like to raise for the purposes of the macro-economic analysis of a government budget and those questions would not be answered unless one knows fully how the fiscal deficit is decomposed by the types of borrowing resorted to. Its mere aggregate size would not make us particularly wise either in terms of economic analysis or for policy purposes. That is why I have, as I have explained elsewhere,* expressed my serious reservations to the shift in emphasis, on the part of policy-makers, to fiscal deficit as a tool of fiscal policy rather than traditional measures like revenue deficit and budgetary deficit. In the calculation of the former, no capital receipts can figure and in the calculation of the latter government borrowing from the central bank is made the focus of attention.

TABLE 2: SELECTED CAPITAL ACCOUNT TRANSACTIONS OF CENTRAL GOVERNMENT, 1993-94 AND 1994-95

(Rs crore)

		1993-94 (Revised Estimates)	1994-95 (Budget Estimates)
I	Capital account expenditure *of which*:	33648	32888
	(i) Loans and advances (a)	6084	6167
	(ii) Budgetary support plan for investment in public enterprises (b)	7451	7201
	(c)	(3379)	(3664)
II	Capital account receipts *of which*:	58646	59615
	(i) Recoveries of loans	6655	6700
	(ii) Sale proceeds of public enterprises equity	2500	4000
Memorandum items			
III	Investment in public enterprises (b)	43892	50066
IV	Internal and extra budgetary resource generation to finance above investment (b)	36441	42865

(a) Includes loans to state and union territories, foreign governments, public enterprises and others, non-plan loans. Provisions for loans to public enterprises of Rs 780 crore for 1993-94 and Rs 637 crore for 1994-95 are for non-plan loans.

(b) These figures are of Plan investment in public enterprises and their financing.

(c) Budgetary support for Plan investments in public enterprises is in the form of both equity and loans. The figures in brackets are of equity support.

Roja Revisited

Tejaswini Niranjana

VENKATESH CHAKRAVARTHY and M S S Pandian's response ('More on *Roja*', *EPW*, March 12) to my article ('Integrating Whose Nation? Tourists and Terrorists in *Roja*', *EPW*, January 15) helps open out the debate on contemporary popular cinema in important directions. As both our interventions make evident, the debate is not just about one film but about how to characterise dominant representations of the nation, the state and the Indian middle class today. Chakravarthy and Pandian argue that "the entire narrative of the film is keyed to the disavowal of the state and the proclivities of female subjectivity" and that "the apparent inability of the state" therefore "actually masks its silent and powerful ability", making the "ultimate victors" in the film "the state and the Hindu-patriarchal culture".

Although I admire the finesse with which Chakravarthy and Pandian delineate the elaborate masking in *Roja* of what they call "silences, evasions and erasures", I would like to take issue both with their presentation of my own argument and with their analysis of the film, without necessarily engaging directly with their theoretical procedures which are somewhat different from mine. I did not suggest that the state in *Roja* is "defeated"; I was trying to point out that it is "rejected" (by a newly articulate middle class). In making this argument, I had in mind the post-colonial Nehruvian state and its welfarism, which, it seems to me, is being significantly challenged—and undermined—by the creation of new middle class/upper caste spaces. I would contend that the rejection of *this* form of the state is being repeatedly enacted in a host of TV serials and commercial films and in popular fiction. These cultural practices, among others, are engaged in the fabrication of new subjectivities and the production of new symbolic orders. After Mandal, and after GATT, new 'Indian' selves/subjects, and the new worlds predicated onto these selves, are coming into being. I emphasise the *newness* in order to indicate that a different kind of *nation* is now being imagined, a nation not necessarily congruent with the sovereign state of the 1950s, a nation in which the assertion of true Indianness is not at odds with the erosion of economic/political autonomy.

The anti-colonial nationalism of the earlier part of this century has given way to a nationalism that is not uncomfortable with the aggressive westernisation of our everyday life. We watch Speilberg's *Jurassic Park* and Disney's *Jungle Book*, but now in Hindi (in our own sweet language, as one newspaper advertisement put it). If, as Partha Chatterjee has argued in *The Nation and Its Fragments*, Indian nationalism comes into being through the assertion of *difference* from the coloniser, we need to reflect on what difference means today, or what it means to live *as an Indian*. As I have tried to show in my analysis of *Roja*, certain kinds of ethnic markers (Rishi and Roja's wedding rituals, Roja going to the temple in Kashmir) are presented as normative, while others (the militants' clothes, Liaqat's constant praying) are signs of illegitimate otherness. So while there is an ethnicity that is seamless with modernity, there are other ethnicities that are seen to subvert the project of the modern and must therefore be rendered powerless or invisible. This is what I was getting at in asserting that Rishi's nationalism is not anti-western but anti-Muslim Perhaps I should put it differently: the new nationalism is *pro*-western and is thus, by definition, anti-Muslim.

In my article, I tried to show how Roja and Rishi's Hindu-ness is represented as an integral part both of their modernity and their (authentic) Indianness. Two other terms that should be addressed here are 'secular' and 'human'. I had said in my paper that "the burden of the film [is] to create the convergences between the *human*, the *secular* and the *nationalist*". To this end, *Roja* represents Islamic militancy not only as anti-national and anti-secular but as lacking in humanity. Liaqat's transformation by Rishi at the end of the film is presented as a return to the human that also brings him back into the nation.

In 1990, the word 'secular' was often used in the mainstream press to characterise the participants in the anti-Mandal agitation, who—being interested only in 'merit'—were represented as having transcended caste. In the famous sequence where he throws his body onto a burning Indian flag and stands up all aflame, Rishi Kumar in *Roja* is the very image of the upper-caste anti-Mandalite prepared to die for secularism. The 'secular' is defined against those who declare caste-identity to claim reservations (who thus become the real casteists), just as in *Roja* it is defined against those who against those who assert their Muslim identity (and thereby become fundamentalists).

I have not referred to Chakravarthy and Pandian's argument about *Roja*'s disavowal of female subjectivity and the overlap between state and Hindu patriarchy. I shall only suggest that Roja the protagonist is complicit with the production of Hindu as Indian, and occupies a position structurally dissimilar to that of the militants Wasim Khan and Liaqat. To investigate the contemporary reformulation of patriarchies, and the lineaments of the state which is coming into being, is beyond the scope of this brief response

If we are to be alert to the myriad ways in which subjectivities are being fashioned today, we need to attend to the practices of everyday life, to the politics of civil society. To argue, as Chakravarthy and Pandian do, that the burden of *Roja* is ultimately to assert the strength of the state is to de-emphasise, or so it seems to me, its other, far more powerful seductions, which offer us glamour as well as righteousness, cosmopolitan modernity as well as national pride.

Social Indicators of Development for India—II

Inter-State Disparities

EPW Research Foundation

APART from India's generally low level of social development, there is the acute inter-regional and inter-state disparity in such development that has to be reckoned with. As depicted in Tables 1 to 6 when inter-state comparison is made, a complex scenario emerges. The literature has emphasised various types of linkages between three groups of factors determining social development: demographic factors (crude birth and death rates, child and maternal mortality rates, and family regulation achievements); literacy and educational attainments; and income and other economic indicators. It is interesting that the records of various Indian states in these respects do not provide any clear-cut linkages. Broadly, the inter-state comparison suggests that any stand-alone performance in respect of any one of the above three aspects does not appear sustainable. Thus, it is found that tangible reductions in birth and death rates, for instance, are not possible without a significant improvement in literacy rates. In fact, literacy attainments, particularly amongst women, seem to play a pivotal role in containing population growth (e g, Kerala and Tamil Nadu). Associated with women literacy is also better participation of women in paid labour which recognisedly contributes to a reduction in birth rate[1] (Table 4). A second important lesson thrown up by state-level performances is that initial push to literacy and demographic achievements is a necessary condition for economic improvement but it is not a sufficient condition [e g, Kerala's high social development accompanied by relatively lacklustre economic development; Sen(1993)]; concerted efforts will have to be made to harness physical and material resources to improve overall investment, output and employment opportunities [Gopalan 1985]. The contrary is equally true that substantial economic improvement does not by itself ensure better social indicators (e g, Haryana's high birth rate particularly in rural areas).[2] A third and final lesson relates to the development in these respects in urban India. In all the states, as expected, the urban areas exhibit lower birth and death rates, higher literacy rates and higher per capita earnings as a result of the dominant urban-orientation of India's economic and social development. While these obviously had their mutual influences, the phenomenon of small family size and the success of family planning programmes in some urban areas may as well be poverty-driven (e g, West Bengal) [Bose 1994]. It is also likely that labour-sensitive agriculture in some states like Punjab and Haryana is inducing households to maintain higher birth rates though reductions in crude death rates in these states have been significant.

In demographic trends, the performance of the southern states is noteworthy (Tables 1 and 2). While Kerala's low birth and death rates and population growth rate is widely known, the performance of Tamil Nadu, close to that of Kerala, has been equally commendable. Population growth in Tamil Nadu by 17.5 per cent during the decade 1971-81 and by 14.94 per cent during the decade 1981-91 was lower than or close to that of Kerala (19.24 per cent and 14.06 per cent, respectively), though it must be recognised that Kerala had achieved remarkably low levels of both birth and death rates much earlier during the 1970s and 1980s. As per the three-year averages of birth and death rates revealed by the Sample Registration System (SRS), it is the most rapid decline in the crude birth rate (from 27.9 per 1,000 population during 1981-83 to 21 during 1990-93) as well as death rate (from 11.6 to 8.6 per 1,000 population) in respect of Tamil Nadu since the beginning of the 1980s that stands out (Table 1).

The performances of Andhra Pradesh (with birth and death rates of 25.5 and 9.3, respectively) and Karnataka (27 and 8.5), while they are much better than the national average, have not generally been as good as those of Punjab, Haryana, West Bengal, Maharashtra and Gujarat. Amongst them, again, there are some significant differences. After Kerala and Tamil Nadu, Maharashtra stands third and West Bengal fourth if both their birth (26.3 and 26.6, respectively) and death rates (7.8 and 8.3, respectively) are taken into account, but, as shown in a subsequent paragraph, West Bengal's rural birth rate remains high. Punjab and Haryana have attained reasonably low levels of crude death rates (8.2 and 8.6, respectively, during 1990-92) but their birth rates at 27.5 and 32.3 are higher than all the seven states of the southern and western regions cited above.

At the other extreme, all the six major underdeveloped states, namely, Bihar, Uttar Pradesh, Madhya Pradesh, Rajasthan, Orissa and Assam, continue to experience high levels of crude birth and death rates (ranging from 30.4 to 35.7 and 10 to 13, respectively) during the latest period. Amongst them, some of the states like Madhya Pradesh and Uttar Pradesh, despite experiencing the highest birth and death rates in India, have shown the least progress during the 1980s. Madhya Pradesh's crude birth rate has only declined from 38.2 during 1981-83 to 35.7 during 1990-92 and death rate from 15.4 to 13 and Uttar Pradesh's birth rate fell from 38.9 to 35.8 and death rate from 15.7 to 12.1.

A remarkable aspect of not only Kerala but also that of Tamil Nadu is the unduly narrow dispersion between their rural and urban areas in regard to crude birth and death rates (Table 1). During 1990-92, Kerala's birth rates in rural and urban areas were 18.4 and 18.7, respectively, while those of Tamil Nadu were 21.2 and 20.6, suggesting that there is a fair degree of continuum in these states in regard to socio-economic characteristics as between their rural and urban areas; this is also reflected in somewhat less rural-urban disparities insofar as their health and educational infrastructures are concerned. However, the states next in order of demographic development, namely, Maharashtra and West Bengal, exhibit considerable divergences as between their rural and urban performances. Considering the general impression of better rural development in West Bengal during the 1980s, the disparity within West Bengal seems glaring with birth rates of 30 in rural areas and 17.8 in urban areas and death rates of 8.9 and 6.8 in the two areas, respectively. In Maharashtra, the birth

rates were 28.2 in rural areas and 22.7 in urban areas and death rates 8.9 and 5.7, respectively. To an extent, their metropolitan cities should be contributing to this disparity even though the differences in birth rates of rural and urban areas in West Bengal are too glaring to be explained by that phenomenon alone.

A significant decline in the total fertility rate has occurred in Kerala and Tamil Nadu in particular (Table 2). Having said this, it must be recognised that Kerala's performance in regard to low mortality combined with the persistence of a high incidence of morbidity [Soman and Panikar 1993] is probably reflective of what Gopalan (1985) hypothesised: "Economic development and removal of poverty are basic requisites for better nutrition; 'social development' and even female literacy can be no proxy for this" (p 164). Soman and Panikar report that Kerala experienced the highest reported morbidity, both acute and chronic as late as in 1987; morbidity was more acute amongst the poor households as compared with the rich (Table A). As it is recognised in literature [Soman and Panikar 1993], in situations such as that of Kerala, high morbidity could be the result of better consciousness of ailments and sickness amongst the populace. On the question of morbidity, Murray and Chen (1992) find large discrepancy between self-reported morbidity and observed morbidity based on clinical examination. Field survey data apparently indicate that "self-reported acute morbidity in the United States is much higher than in rural Kerala, where in turn it is several times higher than the Indian national average for rural India. For each of the five chronic conditions, prevalence in the United States is much higher than in any Indian state" [Murray and Chen 1992: 484-85]. Suggesting the possibility of as many as eight patterns of interactions between three components of change in health—self-perceived morbidity, observed morbidity and mortality—Murray and Chen(1992) propose a multi-disciplinary approach to the analysis of the complex and confusing patterns of change.

TABLE A : MORBIDITY RATES, KERALA VS INDIA

	NSSO 1974		KSSP 1987	
	Acute	Chronic	Acute	Chronic
Kerala	71.21	83.68	206 39	138.02
India	22.46	20.98	–	–

Source: Soman and Panikar(1993)

Also, there is no gainsaying that while there has been a remarkable expansion in the infrastructure for health care delivery in Kerala, a wholesome and all round improvement in health required better and more equitable levels of living.

Be that as it may, that demographic performance of the top and the bottom states is closely linked to their achievement or lack of it in literacy rates is self-evident. While Kerala, Tamil Nadu, Maharashtra and West Bengal enjoy amongst the major states the highest women literacy rates interestingly in the same order, the lowest literacy rates are also experienced by Rajasthan, Bihar, Uttar Pradesh, Madhya Pradesh and Assam. Punjab and Haryana fall mid-way in this respect (Table 3).

The social indicators cited above and also others indicated in Tables 1 to 4 do not correspond to the broad indicators of economic development for the respective states. In respect of both per capita state domestic product (SDP) and people below the poverty line, Punjab and Haryana score over other states, or at the other end, Kerala and Tamil Nadu truly represent low levels of economic development (Table 5(a)). Interestingly, Kerala experiences the highest rate of unemployment in the country (Table 4). Nevertheless, when we construct a rough physical quality of life index (PQLI) or a human development index(HDI) for the major Indian states based on the existing literature on the subject by combining social and economic indicators of development as depicted in Tables 5(a) and 5(b), we find that only Kerala retains its top position in these composite indices with the second position being usurped by Punjab, suggesting that the dominance of social indicators in respect of Kerala and that of economic development in Punjab has been overwhelming. A disquieting aspect has been the distinct decline in per capita expenditures across the states on education and medical and public health since the second half of the 1980s (Tables 6(a) and 6(b)).

Notes

1 In fact, it is not just literacy. As Padmini Swaminathan(1994) points out in her report of a seminar session, "The example of Sri Lanka is pertinent at this juncture. The abolition of child labour, compulsory attendance at school of children below 15, reservation of certain jobs for women which dramatically increased employment of women, have had remarkable impact on the birth rates in Sri Lanka. The message is clear allowing women space and scope for personal development has a more direct and lasting impact on reduction in birth rate than any technology driven coercive population control programmes."

2 "But the results of economic growth are not always channelled toward such programmes Many nations—such as Saudi Arabia, Gabon, Brazil and South Africa—have much worse records on education, health and welfare than do other countries (or states) that have much lower GNPs but more public-oriented policy, Sri Lanka, China, Costa Rica and Kerala, among them. The crucial point is that poor countries need not wait to get rich before they can combat mortality and raise life expectancy" [Sen 1993].

Notes ** All India aggregate excluding Union Territories

* Some of the figures for these states are unavailable due to unorganisation of states according to present classifications

Therefore figures for Tamil Nadu, Karnataka Meghalaya, Mizoram Arunachal Pradesh and Haryana are unavailable

They are to be seen as Mysore State for Karnataka, Madras Presidency for Tamil Nadu, Punjab includes present day Haryana, similarly for Assam and the other north-eastern states

The 1971 Census figure for Goa is inclusive of Daman and Diu as Goa had not converted to Statehood at the time under consideration

We help Nature keep her true colours.

As reputed manufacturers of vital chemical products, we've been in the forefront of promoting safety and environment protection.

Our commitment to preserve the environment, improve safety and enhance the health and welfare of our employees and the surrounding community manifests itself in every facet of our operations, right from our choice of technology to process selection and engineering design.

Effluent treatment plants at both our factories render liquid wastes harmless. Sophisticated pollution abatement equipment keep emissions within tolerance limits.

Our R&D wing develops products that are environment friendly, searches for ways to recycle waste and constantly evaluates the effectiveness of our own pollution prevention and control efforts.

We've designed education programmes to inform, train and encourage our employees to actively participate in achieving safety and environmental protection goals, safety inspections and safety audits to assure continuous control and, onsite and offsite disaster control plans to aid effective response to a wide range of emergencies.

It's all part of our integrated effort to keep our operations safe and harmless.

And to ensure that we help Nature keep her true colours.

PUBLIC ENTERPRISES AND PRIVATE PURPOSES

ECONOMIC AND

Vol XXIX No 22 May 28, 1994

Public Good and Private Use

An examination of the objectives and priorities with which public enterprises are run reveals several factors which affect their performance, such as sluggish public investment, misutilisation of their capacities and capabilities, etc A basic factor is that public enterprises have been used for private purposes by those who control them. 1338

Big Changes in Small Scale

Small-scale industry all over the world has undergone change in the context of globalisation, technology revolution and structural reforms. What lessons can international experience provide for India? M-46

Losing Ground

While maintaining its position as one of the three leading industrial states of the country, Tamil Nadu has nevertheless over the years lost considerable ground and many opportunities. M-64

Filling the Vacuum

The large-scale participation of migrant communities in the riots following the demolition of the Babri masjid in December 1992 in Surat is explained by the fact that these upwardly mobile Hindu communities were looking for a larger political role, which the BJP and the Hindutva forces could provide 1348

Negative Impact

The growing unemployment consequent upon the implementation of the new economic policy and the threatened exit and downsizing are likely to have a negative impact on workers affecting their self esteem and therefore their skills and innovative capabilities. M-75

Dreams and Reality

In the months preceding and following D-Day 50 years ago, the thrust of the debate was the imperative of social transformation. The traumas of fascism and imperialism would vanish, preparing the earth for a greater share of decency, rectitude and probity. 1332

Hobnobbing with Dinosaurs

The PM's visit to the US has underlined the fact that there is political will behind accepting the new world order being dictated and dominated by the American dinosaurs. 1321

Assessing Performance

Intra-firm strategic performance assessment of the Indian pharmaceutical sector using data envelopment analysis provides precise information on the relative performance of private and public sector undertakings and the underlying factors. M-83

Nagas and Kukis

The violent clashes between Kukis and Nagas in Manipur are a consequence of the nature of the Kuki tribes and the artificial boundaries imposed on them by various rulers 1331

Self-Defeating?

Are the changes being affected by the regulations newly introduced by SEBI consistent with the professed twin goals of capital market development and investor protection? M-90

Taking Stock

The Indian stock market, in spite of the prevailing high price-earnings ratio, may be attractive to foreign investors because of its excellent diversification potential. M-96

Unsuitable Variable

Anchored as it is in a caloric norm, the poverty ratio is at best an indicator of 'food poverty' and is an unsuitable variable for estimating the distribution among states of shareable pool of taxes. 1324

Striking Out

Malaysia's recent assertive stance on international issues is a sign of the coming of age of the country's political elite. 1333

Seeking Solutions

Environmental degradation cannot be dealt with through technological fixes and the legal machinery 1329

The starting point for sustainable development should be the countries of the north which through the present high levels of consumption and polluting technologies damage not only their own environment but even that of the south 1327

LETTERS TO EDITOR

Oppose State Violence!

ON the pretext of eradication of naxalism the Andhra Pradesh government has unleashed unprecedented violence on the people of north Telangana districts. Encounter has become a synonym for police murder. Police officials often warn the person who questions their brutalities, "I'll 'encounter' you, if you do not change your attitude of questioning". Every move of the masses against the exploitation and repression by landlords is viewed through the eyes of law and order. Most of the villages in north Telangana have become camps of Andhra Pradesh State Police (APSP), CRPF, BSF and ITBF. These armed forces maintain law and order in the villages under the guidance of landlords. The landlords and police forces unitedly run the administration of the village. Any opposition to their domination leads to encounters. Even workers' organisations and students' unions have been branded as extremists' wings. In fact, these mass organisations have been organising, for the past 20 years, the downtrodden people against cultural and economic hegemony.

In order to make people aware of their constitutional rights, students' and workers' unions such as PDSU, AIFTU, RCS and POW organised a convention last February on 'People's Democratic Movements and State Machinery' in Karimnagar town. Instead of giving permission to hold this convention, the government deployed hundreds of police personnel in and around Karimnagar. All the routes from various areas were blocked. Video cameras were arranged at the doors of the convention hall. Delegates and journalists were harassed and assaulted. Cameras of press persons were snatched and smashed. Ahuja (Delhi), retired judge Suresh (Bombay), N V Kirshnaiah (MLA) and M T Khan (APCLC) were among the victims of the police violence. While the police violence was strongly condemned by the opposition members, the chief minister K Vijaya Bhaskara Reddy reacted by saying that "all the delegates present in the convention were none other than naxalites". In other words, the head of the government encouraged the police to continue their extra constitutional activities.

It is no wonder then that there are hardly any villages in Karimnagar district which have not gone through nightmarish experiences, such as police gang-rapes and third-degree tortures. On April 8 this year at Rajannapet village of Yellareddypet mandal, the police brutally killed six workers of CPI(ML) Janashakti who were campaigning against Dunkel Draft. Soon after the action, the police fabricated an encounter story to misguide the people. On April 15, the police killed two workers of PWG and narrated the same old encounter theory. Another police action in Jagityal area sent tremors of fear among the masses. A person from Chinnaraopet village was tied to a bag of explosives and set on fire. The climax of these fake encounters was seen in the cold-blooded murder of Boda Laxmareddy alias Bhoopathireddy, secretary of CPI(ML), Karimnagar district, who had been working for the people for the last 18 years. The SP of Karimnagar stated several times that B Bhoopathireddy would be shot dead at sight. The police arrested and killed him at Hyderabad and wove a story of an encounter death.

We, the people of north Telangana, are living under the shadow of the state gun. We do not know when we will be branded as extremists and killed in encounters. The general secretary of APCLC, K Balagopal, correctly said that "during the last three years 496 persons have been murdered by the police in the name of encounters". The essence of this statement has also been substantiated in the words of Supreme Court that "police are licensed goondas". We convey our thanks to APCLC and other democratic organisations for submitting a 500-page report of police atrocities to the Human Rights Commission. Can we expect justice from the commission? While I am writing this, there is news from Karimnagar that Bheemanna, organiser of CPI(ML) Janashakti has been arrested and may be another victim of police 'encounter'.

We appeal to all democratic organisations to oppose the genocide being practised by the Andhra Pradesh government and help the people to realise their right to live.

Oppressed Tribals

LANCY LOBO's report on the suppression of Valia tribals (January 15) is well documented on the aspects of oppression by the state as far as land, water and forests are concerned. Now the tribals have become intruders in their own land because of the introduction of forest laws which prevent them from earning from minor forest produce. Tribals as agricultural labourers in the plains, being alienated from their lands and people, are living in deplorable economic conditions. In many parts of India, tribals who were cultivators have become agricultural labourers. As a result, their position is getting eroded. The police, landlords, and the politicians lobby or nexus is creating havoc in the country. It is like the fence eating away the field; the police who are supposed to help the people are unleashing terror on common people not only in Valia of Bharuch district of Gujarat, but in many other parts of the country. This sort of vandalism by the state machinery cannot be accepted and tolerated any more. The brutal attack by the state on tribals like Chhotubhai should be strongly condemned.

It is a pathetic situation that when a sitting MLA has no safety for his life and chooses to go underground, what about an ordinary citizen's life? On the other hand, the government speaks about the human rights commission without any commitment to the human rights protection. It is high time that the government prevented such acts of oppression on the tribals and weaker sections.

ECONOMIC AND POLITICAL WEEKLY

All Gloss

THE departmental annual reports presented to parliament every year are meant to provide a backdrop to the concerned public policies under implementation and also contain a succinct assessment of the progress achieved in relevant sectors. The latest annual report of the ministry of industry covering four major departments, namely, those of industrial development, heavy industry, public enterprises, and small-scale, agro and rural industries, does nothing of the sort. While radical changes have been introduced in industrial policy apparently to "accelerate the pace of industrial growth" by providing greater freedom in investment decisions, keeping in view the objectives of efficiency and competitiveness, technological upgradation, maximisation of capacity utilisation and increased exports, the overall industrial production under the impulse of the new economic policy, has nearly stagnated continuously for three years 1991-92 to 1993-94 and is showing no signs of improvement in the fourth year The ministry's report fails even to recognise the deteriorating conditions leave alone make any worthwhile analysis of the persistent stagnation and its possible causes

Supply factors such as steady agricultural growth, reasonably good growth in infrastructure industries, and unfettered freedom for domestic and foreign industrialists to set up industries, have not really helped matters. Apart from the severe demand constraint attributable to the contraction in public expenditure and investment in real terms, a serious structural crisis has been created by the reforms programme. The public sector production and investment programmes, which have been sizeable and in bulk areas of basic and capital goods industries, have suffered a setback and these gaps cannot be filled by the private or even foreign entrepreneurs for some years to come. The overall investment demand will continue to suffer. Likewise, public sector investment had helped to create some economic activity in underdeveloped states and regions—a goal which has obviously received a serious setback. Finally, due to growing unemployment, the effective purchasing power of the average population has been eroded giving rise to reduced demand for industrial goods of common consumption. As a result of these structural factors, the industries showing noticeable negative growth are capital goods and consumer non-durable goods industries. The industry ministry's report shows hardly any awareness of these phenomena.

Nor does the report present any perspective of future industrial development, its structure and content. In the current phase of development, the entrepreneurial proclivities—domestic or foreign—will not necessarily produce an optimum structure. Some industries will have to be specially promoted and others discouraged by public policies. Such a priority in industrial development is particularly required in the context of the acquisition and adaption of new and advanced technology. The office of the directorate general of technical development (DGTD) has been disbanded, though there was a strong case for using that organisation to promote the transfer and absorption of appropriate technology in Indian industry. The report does recognise that a great deal of technology upgradation and modernisation will take place "rapidly leading to some distortion in the existing industrial structure" but this is emphasised only in the context of the need for a national renewal fund(NRF) and for minimising the adverse effects on industrial workers. The direction in which the restructuring process will take place in industries and its technological base has received scant attention in the report. It is significant that the technical development fund (TDF) scheme, which has been in operation since 1976 with the specific purpose of promoting modernisation and upgradation of technology, has been, with the $ 100 million World Bank assistance, converted into a scheme which "is to support liberalisation of technology/capital goods imports". Admittedly, the scheme is now being operated only for the import of technology under the new import-export policy of 1992-97.

Some of the deleterious effects expected from the new industrial policy are glaring and are evident from the basic information provided in the annual report. With the freeing of industries from industrial licensing, industries which do not require licence and other industries which hitherto required to be registered with the concerned authorities, now have to file an industrial entrepreneurs memorandum (IEM). A statewise analysis of such IEMs shows how the regional distribution of new industrial units is sure to be grossly unbalanced. During the post-reform period of 29 months from August 1991 to December 1993, such IEMs numbered 12,400 for a total investment of Rs 2,56,158 crore with the hope of generating employment for 23,95,728 workers. Of these, as much as 34.92 per cent in terms of number, 35.86 per cent in terms of investment amount and 32.34 per cent in terms of employment will be concentrated in the two western region states, Maharashtra and Gujarat. At the other extreme, the shares of Bihar, Orissa and Kerala in new industrial proposals are minuscule. Bihar would account for only 0 98 per cent in terms of number, 1.38 per cent in terms of investment and 0.61 per cent in terms of employment; likewise, Orissa 0.69 per cent, 1.13 per cent and 1.54 per cent, respectively, and Kerala 0.76 per cent, 1.05 per cent and 0.81 per cent respectively. Interestingly, the share of Dadra and Nagar Haveli (population: 1,38,477) in the industrial proposals (1.2 per cent in number of IEMs or 0.65 per cent in terms of their proposed employment) is higher than that of Bihar with a population of 86.37 million (1991 census). The possible deterioration in inter-state disparity may be judged from the fact that as per the latest *Annual Survey of Industries for 1989-90*, Maharashtra and Gujarat together account for only 25.2 per cent in terms of factories, 25.7 per cent in terms of fixed capital and 24.3 per cent in terms of employment in the factory sector. On the other hand, Bihar now possesses a higher share though even that proportion has not helped the state to move out of its acutely underdeveloped

character As per the ASI for 1989-90, Bihar had 10.7 per cent of the factories, 6.8 per cent of fixed capital and 4.9 per cent of factory employment.

A second deleterious effect is in the disappointing performance of major engineering items whose physical output figures in 1992-93 were in many cases less than half of what they were in 1990-91. The worst performance being in the electrical machinery industry The output of ASCR and AAC conductors in 1990-91 was 67,623 tonnes, a capacity utilisation of 45.6 per cent in that year. In 1992-93, its production stood at 24,279 tonnes, a capacity utilisation of just 16.4 per cent. Other important electrical machinery and component industries experiencing drastic reduction in output during the period are: dry cells (12,35,659 in thousand numbers to 11,92,464 in thousand numbers), power capacitors (33,58,629 KVAR to 30,12,163 KVAR), welding electrodes (5,65,506 thousand run mt to 5,13,087 thousand run mt), electric motors (7,90,885 to 2,43,135), alternators/generators (48,82,702 KVA/25,97,879 KVA), transformers (365,87,626 KVA to 345,64,075 KVA), circuit-breaker switchgears (11,24,087 to 9,43,301), transmission line towers (88,391 tonnes to 84,660 tonnes) and cranes (17,184 tonnes to 8,903 tonnes). Amongst non-electricals, the output of commercial vehicles declined from 1,44,556 in 1990-91 to 1,03,000 in 1993-94. In many of these industrial categories, the capacity utilisation has declined rather drastically giving rise to misgivings regarding their long-term viability. The industry ministry's annual report shows no awareness of the damage being inflicted on the capital goods sector.

The disappointing performance of the capital goods sector is reflected in the working results of public sector undertakings (PSUs) under the department of heavy industry. Their production levels have been much below their targets and they have declined even in real terms over the recent period, with the order book position also deteriorating. BHEL's production at current prices was Rs 3,154 crore in 1990-91, Rs 3,331 crore in 1991-92 and Rs 3,508 crore in 1992-93; it is expected to be lower at Rs 3,400 crore each during 1993-94 and 1994-95. Similarly, HMT's output was targeted to be Rs 1,026 crore during 1993-94 but now it is expected to be 23 per cent lower at Rs 792 crore which is to be contrasted with the earlier peak output of Rs 850 crore in 1991-92. Overall, 48 PSUs had a production target of Rs 10,027 crore for 1993-94 but the actual output expected now is Rs 8,782 crore The order books of these PSUs have also steadily fallen from goods worth Rs 12,028 crore as on October 1, 1990 to Rs 9,747 crore as on October 1, 1993 The total employment in 48 PSUs as on March 31, 1991 was 2,49,613 which has dwindled to 2,26,243 as on March 31, 1993—a loss of 23,370 jobs in two years. The implications of all of these on the process of industrialisation in India are lost on the bureaucracy which has indulged in producing a glossy annual report that is hardly illuminating.

BIOTECHNOLOGY

Weak Monitoring

BIOTECHNOLOGY is among the fastest growing disciplines in recent years and so vast is the potential, for harm and good, that as early as 1973 some scientists involved with the emerging field had called for a moratorium on certain types of research because these were associated with unknown risks. But in the intense preoccupation with the development of exciting new techniques and the possibilities of transforming life forms to meet human needs, these cautionary voices have largely been dismissed as emanating from the ethical dilemmas of an older generation of scientists. The special hazards of biotech research is that genetically engineered organisms may, if they are accidentally released, cause grave and irreparable ecological and epidemiological damage. The other even more complicated issue is the fact that it would be impossible to assess the long-term impact of releasing a genetically altered organism into the environment, no matter how 'useful' such a product may be. The biological world is a closely interlinked chain where one small alteration in one link may well cause changes elsewhere. So, unlike in a chemical product, a recall of the product will not right matters in time and the change will be permanent.

There has however grown a body of regulatory mechanisms in countries where biotech first emerged which now make it more difficult for developers to release bioengineered products without them being verified as comparatively safe by constituted authorities. Inevitably, the third world, with poorly developed regulatory mechanisms and a highly distorted appreciation of scientific advance as the precursor of social advancement has become the favoured spot for the release and testing of bioengineered products. Companies with their single-minded pursuit of reducing the time-lag between research, development and marketing of new products, have given ethical considerations a go by. In Argentina, for instance, the biotech company WISTAR institute in 1986 tested bioengineered rabies vaccine on cattle without even a formal application for consent from the government

The same institute is a participant in the Indo-US Vaccine Application Programme (VAP) in India Under the programme, Indian scientists have been working on 12 projects aimed at developing diagnostic kits and vaccines for viral hepatitis, rotaviral and E coli diarrhoea, cholera, typhoid, polio and respiratory infections. Some of these have moved from the stage of a study of existing organisms and the immunological responses in animals to bioengineered organisms with the desired characteristics. Many are now awaiting field trial. In an environment where research activity has to be cost-effective in the narrow sense of the term, little attention is paid to exploring the long-term and larger consequences of meddling with biostructures.

Progress on safety guidelines has been slow in India. The department has as usual set up a number of committees to monitor research work. For example, institutional biosafety committees have been set up in 50 institutes and a review committee on genetic manipulation has been constituted, which, at its first meeting made these banal recommendations: that import of transgenic materials in bulk should be avoided, that co-operation from funding agencies and institutions is imperative, that only those proposals which are being readied for field trials should be considered by the committee.

Clearly these regulations are insufficient for a competent monitoring of biotech research. For example, given the present experience with, say, ethical or equipment safety committees in research institutions, the existence of institutional safety committees does not mean that they are functioning or are doing what they ought to. A recent review of X-ray units and the handling of radioactive material in laboratories has revealed the very poor implementation of safety standards. And in a new discipline like biotech, where the safety standards are ill-defined and there is a rush to get in on the ground floor and to produce results, self-regulation is hardly likely to be effective. Then again with several pharmaceutical MNCs on the verge of restarting and/or expanding their bioresearch facilities here, there will no doubt be raised issues such as company secrecy on research, patenting considerations, etc, which will make it impossible to monitor research. There is an imperative need to evolve stringent regulations and create enforcing agencies with the authority to suspend and terminate unsafe research.

ASSAM

Electoral Rolls Tangle

A correspondent writes:

THE recent judgment of the Supreme Court upholding the orders of the Guwahati High Court which had held on January 28 that Clause 7.4 of the Special Revised Instructions (SRC) of the Election Commission (EC) issued on May 18 last year was "unconstitutional, arbitrary and violative of the Representation of Peoples' Act, 1950, and rules framed thereunder", brings to an end the prolonged bureaucratic and judicial wrangles over the revision of electoral rolls in Assam. The Election Commission had filed

a special leave appeal against the orders of the Guwahati High Court which had been made on a writ petition challenging the EC's guidelines filed by some leaders of the United Minorities Front (UMF). That appeal was dismissed by the Supreme Court on May 5.

While the Supreme Court's judgment brings the legal and bureaucratic wrangles to an end, the political implications of the judgment are likely to remain a controversial issue. For, though the original guidelines as well as the SRC of the EC were opposed (as also tacitly or openly supported) by several political parties, the grounds for such opposition (and support) and the apprehensions and expectations that these guidelines evoked have been projected and exploited selectively. This feature is likely to persist irrespective of the legislative and legal position.

The apex court's orders also constitute a vindication of the stand of the state government (more accurately, the Congress Party) as well as minority organisations which had taken the initiative to challenge these Special Revised Instructions of the EC. Though the state government had only intervened in the hearing of the writ petition by the UMF in the Guwahati High Court and the EC's special leave appeal against the Guwahati High Court's judgment in the Supreme Court, since the judgment was delivered the Congress Party in the state is claiming credit for this development. Indeed, both the Congress and the UMF have been claiming exclusive credit for this development, with the Congress in the state (no doubt with some prompting by the chief minister) congratulating Hiteswar Saikia "for his single-handed efforts to restore legitimate rights to deprived Indian citizens in the new electoral rolls of Assam".

With this, the decks are cleared for the preparation and publication of the final electoral rolls in Assam. The whole process had been stayed following the directive of the Supreme Court by the Election Commission on April 25.

Crucial to the prolonged wrangles whose beginnings are to be traced to the procedure prescribed for an intensive revision of electoral rolls in the state, spelt out in an EC notification dated August 21, 1992, are Clauses 7.3 and 7.4 of the SRC which the Guwahati High Court had held as violative of Article 14 of the Constitution—an order now upheld by the apex court. The two clauses read thus:

> 7.3. The Electoral Registration Officer shall also take every possible care to ensure that the names of persons in whose cases objections were filed and upheld, as well as names of persons whose claims were rejected during any earlier revisions of 1990, 1985, etc, on account that they were not citizens of India are not to be included in the draft roll He should also ensure that cases where enquiries have been initiated by the police with a view to filing cases under the Foreigners Act, 1946 or IM(DT) Act, 1983, are also excluded.
>
> 7.4 Similarly, the Electoral Registration Officer should ensure that the names of encroachers on VGR/PGR/forest lands/khas lands or any other government lands are not included in the draft rolls.

These guidelines provoked opposition from virtually the whole spectrum of political opinion in the state though the grounds for such opposition were different. For, encroachments on VGR (village grazing reserves) and PGR (professional grazing reserves) and forest and khas lands are a generalised phenomenon with every section of the population encroaching upon them and at the same time selectively blaming every other section. Thus the tribal people in the Brahmaputra plains (who have widely encroached into forest lands) maintain that they, being the original inhabitants of the land, can by definition be not considered encroachers wherever they settle. In contrast, the 'popular' perception holds that the descendants of erstwhile migrants from East Bengal, originally settled as part of an official policy in inhospitable riverine areas and over the years spreading beyond these areas resulting in conflicts with the indigenous peasantry—the Bodoland Autonomous Council area has seen some vicious communal riots over land after the Bodo Accord—are almost without exception encroachers.

The writ petition in the Guwahati High Court had also challenged Clauses 6.7, 6.9 and 6.10 of the SRC which had provided for the publication of two lists of enumerated voters: a List I, containing "names of persons who are verified by the district magistrate to be Indian citizens"; and a List II, containing "those names which are not considered Indian citizens by the district magistrate". Further, Clause 6.10 of the SRC provided that "where the police have initiated inquiries in respect of any person with a view to filing cases under Foreigners Act, 1946 or Illegal Migrants (Determination by Tribunals) Act, 1983, the names of every such person shall also be included in List II and not in List I".

The result of following that directive was that List II had about 15,76,000 names which included the names of about 13,73,000 who had filed claims for inclusion and in respect of about nine lakh of whom the claims had been accepted. According to a document prepared by the UMF, the EC's directives envisaged treating all persons included in List II, including about eight lakh persons whose cases had been referred to inquiries under the IMDT Act and the Foreigners' Act, as 'non-citizens'. According to the UMF, only about 58,000 of these cases had been referred to the tribunals formed under the provisions of the two acts; and according to sources in the state government, only about 20,000 of these had been finally and indubitably found to be illegal migrants.

The Supreme Court's upholding of the judgment of the Guwahati High Court vindicates the objections raised against such anomalies. But the process itself continues to be mired in controversies touching vital political issues going beyond these legalities and bureaucratic snafus.

POLITICS AND CRIME

Cosmetic Action

THE leaders of the CPI(M) in West Bengal have begun to borrow tricks from the police administration. Errant police personnel are quite often suspended or transferred, following public pressure—but only to allow them to surface again at some other place, or even at a higher position, and continue to behave in the same criminal way. Similarly, in the West Bengal CPI(M), errant party members or leaders are sometimes awarded lenient punishment—for public consumption—to be rehabilitated soon after in better positions in the party hierarchy.

To give a recent instance, following a bomb blast in the Bowbazar area of Calcutta in March last year which led to loss of lives and property, an underworld don Rashid Khan was arrested, and police investigations revealed Khan's connections with some top CPI(M) leaders. Public disclosure of the findings compelled the CPI(M) to suspend Shyamali Gupta (a leader of the party's women's front) and Shamim Anwar (a councillor of the Calcutta Corporation). But within a year, both were readmitted to the party. Given the continuing open nexus between the CPI(M) local bosses and the underworld, it does not need prophet to predict that both Gupta and Anwar are well on their way to higher positions in the party.

To cap it all, Rashid Khan was recently released by the court. Now he has come up with further damaging evidence. In an interview with a local daily, he has claimed among his 'helpful' friends a senior CPI(M) leader, who is the party's chief whip. He has also named a former police commissioner as being on his payroll. Significantly, soon after the Bowbazar blast, allegations against both these gentlemen had been made in newspapers. The CPI(M) and the state government had dismissed the charges at that time. It would be interesting to watch how the CPI(M) reacts to Khan's latest disclosures.

One wonders how long Jyoti Basu can choose to gloss over the misdeeds of his comrades. Involvement of party cadres in gang-rape (in Bantala and Birati a few years ago) and murder (the latest being that of Abdul Halim, the secretary of the CPI(ML)'s Kalna unit in Burdwan, on March 28) has become a common phenomenon. Notorious criminals who are party activists and who actively participated in the communal riots that broke out in Khidirpur and Tangra in Calcutta in the wake of the demolition of the Babri masjid are still roaming free. In spite of repeated complaints by the local people

to the police, they continue to enjoy immunity, thanks to the protection they receive from the local party leaders.

The CPI(M) has obviously travelled a long way from those days when even its fiercest political critics and detractors could not discover any cause to blame its cadres for moral crimes like rape, murder for personal gain or involvement in communal riots. The moral fibre of the party has apparently begun to rot, and once that happens, the descent of any communist party cannot be prevented. Jyoti Basu's occasional speeches and directives urging party members to behave and warnings of punitive actions are as hollow as the cosmetic punishments meted out to some among them following public outcry.

INDO-US RELATIONS

Movements of Anxiety

GIVEN the recent history of Indo-US political relations—a history that included Robin Raphael's provocative statements on Kashmir, Clinton's letter to a US senator commenting on the human rights situation in Punjab, and Strob Talbott's muted but clever attempts to diplomatically browbeat the Indian government into submission—Narasimha Rao's US visit was not expected, politically, to achieve very much. As it has turned out, the visit has achieved nothing at all. The officials of the US government put up a pleasant diplomatic front, intended mainly to save Rao from embarrassment at home, but also—and more importantly—to soften the impact of their unwillingness to substantively modify their positions, in the light of the Indian government's concerns, on the political and strategic issues involved. These issues remain: the future of Kashmir, denuclearisation of the south Asian region, and the violation of human rights by India's security forces with regard to its citizens.

On Kashmir, the US seems to have come round to accepting, especially after Talbott's visit, that the issue be resolved, so far as it involves Pakistan, on the basis of the Shimla agreement. Apparently it seems that by making the US articulate this position, Indian diplomacy has scored a point: however, it also means, on the other hand, that the Indian government has admitted that the Kashmir issue is not a purely domestic one. Thus it turns out to be a diplomatic victory of sorts for Pakistan which has always insisted that Kashmir was an international issue. Further, despite the US recognition of the validity of Shimla agreement in the matter of Kashmir, it is unlikely that the US, which seems to view the north-west south Asia in general and the Kashmir region in particular as crucial to its strategic interests in the region, would allow the emergence of an arrangement in Kashmir having the potential to go against its interests.

On nuclear non-proliferation, the Rao delegation failed to break the stalemate. The US side made some noises about India's position not being totally invalid, as did Clinton when he remarked that any attempt to denuclearise the subcontinent must keep in view India's security concerns, or as did one senior US official when he said that at least conceptually it was not difficult to sympathise with the Rao government's insistence on beginning with, as he put it, "global things". Although it was for the first time that the US showed a willingness to even acknowledge the Indian side's concerns on the nuclear issue, these noises, in the absence of an agreement concretising this acknowledgement, cannot be taken very seriously, especially when there has not been even a distant hint of such an agreement.

As for the US 'concern' about the human rights situation in Kashmir and other Indian states, successive US governments have, for quite some time, used the pretext of violation of human rights to promote their political and economic interests in different parts of the world. This 'concern' is not likely to wane in the foreseeable future, and will, for that reason, remain a sore point in the relations between the two countries, not least because the record of the present Indian government on the human rights front is bad and is likely to remain so, despite the setting up of the recent National Human Rights Commission.

Perhaps only on the economic front can Rao's visit be said to have effected some advance in the relations between the two countries. The delegation accompanying Rao utilised the occasion to meet US businessmen and is reported to have been successful in strengthening their already aroused interest in India as a profitable ground for investment. However, a strengthening of the Indo-US economic relations in the current environment needs to be viewed with concern, especially when the most important condition for US investment in India appears to be a breaking down of the already meagre protective legal barriers around the working class here, an inevitable consequence of measures to liberalise the economy further.

PALESTINE

Questionable Tactics

THE killing of two Israeli soldiers by Islamic militants in Gaza recently represents in microcosm some of the challenges the new Palestinian authority, held at the moment by the PLO, is likely to face in the coming months in the self-ruled territories of Gaza and Jericho. The killing took place just two days after Israel handed over most of the Gaza strip to the PLO and a week after it relinquished its power in the West Bank town of Jericho. Though Palestinian and Israeli security forces have started joint patrols in Gaza to prevent the occurrence of similar incidents in future, this is but an *ad hoc* solution to problems that are essentially political and will need to be tackled on that front.

The problems stem from the fact that the Israel-PLO accord of May 4 which has heralded Palestinian self-rule has been opposed by the Islamic fundamentalists fighting for their version of the freedom of Palestine. These fundamentalists, represented mainly by the militant groups Hamas and the Islamic Jihad, have a two-fold objection to the accord. They believe, firstly, that the accord has granted limited political authority in what amount to extremely limited territories. Secondly, they do not relish the idea of the new authority being inherited by the PLO which has always projected itself as representing secular and democratic forces in Palestine. Although there have been indications right from the beginning of the accord of a tacit concurrence between Hamas and the PLO, the killing of the Israeli soldiers within the self-ruled territories as soon as the Palestinian police was deployed, would seem to indicate that the fundamentalists have sought to emphasise that they must be treated more seriously. They have also sounded a warning that their next target could very well be the Palestinian police itself, which is neither as trained as the Israeli army to deal with militants, nor as experienced yet.

Another likely target of the fundamentalist militants are the Jewish settlers around the self-ruled territories. Not only are they the hated symbols of the occupying Jewish state, the fundamentalists may well resort to attacks on them in order to set off ethnic clashes in the Palestinian territories with the aim of derailing the peace process which is now underway. For, an increase in the frequency of attacks on Jewish settlers would not only bring the Israeli government under greater pressure at home to call off the peace process, it would also put the PLO on the defensive *vis-a-vis* Israel, making it unpopular among the Palestinians as it would then be viewed as a 'soft' national representative.

Not that the PLO or Arafat is unaware of the essentially political nature of these issues or of the complexity of the response required to successfully tackle them. However, the problem lies in the choice of the exact political methods to be employed. It is in this context that Arafat's recent call for a 'jihad' to free Jerusalem tends to evoke concern. Even if the term was not used in the militantly religious sense in which fundamentalists use it—as Arafat clarified later—the resort to such language at this point of time can signal a wrong direction to the movement. It can be interpreted as a giving in to the pressure of the fundamentalists, thereby increasing their stock with the people at a time when they need clearly to be firmly told that the secular nature of the Palestinian movement is beyond compromise.

DLF Cement

DLF CEMENT, promoted by the DLF group which has 45 years' experience in the real estate business, is setting up a world-class cement plant with a capacity of 1.4 million tonnes per annum. The plant is to be located in Jaitaran tehsil in Rajasthan which is close to limestone reserves and is near the cement deficit northern region. The company has entered into a technical collaboration agreement with Nihon Cement Company (NCC), one of the largest cement manufacturers in Japan, under which the Japanese company will provide technology which will result in benefits such as low heat and energy consumption, emission levels conforming to international standards and waste heat recovery system which will be utilised to generate power for captive consumption resulting in substantial cost savings. In order to ensure an uninterrupted and consistent supply of power the company will also undertake captive power generation of 15 mw. Commercial production is expected to commence in January 1996. To part finance the Rs 390.2 crore project the company is entering the capital market with a public issue of 99,13,400 secured redeemable multi-option convertible debentures (MOCD) of Rs 85 each at par on June 22. Part A of Rs 50 of each MOCD will be converted into five equity shares of Rs 10 each at par on allotment while part B will be the non-convertible part carrying four options. Under the options the investor can opt for a 17 per cent simple interest on the NCD portion; cumulative interest of 17 per cent on the NCD portion; opportunity to convert NCD portion into equity shares at par (in which case NCD portion will carry zero interest rate); and, last, he can dispose of the NCD portion for Rs 30 each for which arrangements have been made. The issue will be lead managed by ICICI Securities and Finance Company, ICICI, J M Financial and Investment Consultancy Services and Hongkong and Shanghai Banking Corporation.

Shivalik Loha Mills

Shivalik Loha Mills is an existing profit-making company engaged in the manufacture of MS rounds and alloy rounds, ERW pipes and tubes and bright bars. The company now plans to set up steel-melting and billet-making facilities with an installed capacity of 50,000 tpa at a total cost of Rs 6.3 crore. The project is expected to commence commercial production in June 1994. For the eight months' period ended November 1993 the company earned a net profit of Rs 0.2 crore on net sales of Rs 12.8 crore as against a net profit of Rs 0.2 crore on net sales of Rs 17.5 crore for the whole of the previous year. To part finance its project the company is entering the capital market with a public issue of equity shares at par aggregating Rs 4.5 crore on May 30.

Longview Tea

A Deepak group company, the Calcutta-based Longview Tea Company presently has six tea estates in the Darjeeling, Dooars and Terai districts entailing a total area under tea production of 1,950 hectares. The company has now embarked on an expansion-cum-modernisation programme under which it plans to extend plantation and also carry out replantation and rejuvenation in order to increase the tea production from the present three million kgs per year to five million kgs at a total investment of Rs 9.4 crore. For this purpose the company is setting up two more tea estates at Coochbehar and North Dinajpur from which crop will be available from the current year itself. To part finance its expansion/modernisation programme the company plans to enter the capital market shortly with a public issue of equity shares of Rs 10 each at a premium of Rs 55 per share.

Pawan Proteins

Pawan Proteins (India), a company promoted by a group of agriculturists, is entering the extraction business by setting up a plant with a capacity of 150 tonnes per day and a refinery of 25 tonnes per day. The project costing Rs 4.9 crore is being set up in the Beed district of Maharashtra. To part finance the project the company is entering the capital market with a public issue of 21,50,000 equity shares of Rs 10 each at par on May 30.

Mehta Rubber Chemicals

Mehta Rubber Chemicals (MRC) plans to join the band of the only three companies presently manufacturing 2,2,4 trimethyl 1,2 dihydro quinoline (TDQ) and N cyclohexyl 2 benzthiazyl sulphonamide (CBS) in the country, namely, Polyolefins, Bayer and ICI India. MRC is setting facilities for the manufacture of rubber chemicals like tetra methyl thiuram di sulfide (TMT) with an installed capacity of 300 mtpa, TDQ with an installed capacity of 300 mtpa and CBS with an installed capacity of 100 mtpa. These chemicals are used in the manufacture of rubber goods where quality of raw material is a crucial factor. Trial production has already commenced. To part finance the project the company is entering the capital market on May 30 with a public issue of equity shares at par aggregating Rs 1 crore.

Alchemie Organics

Alchemie Organics which belongs to the Rs 105 crore Alchemie group has set up a project for manufacturing quinalphos, carbendazim, di-sulphonamide and n-ndhe mea at Vapi in Gujarat. The project costing Rs 7.4 crore is to be part financed through a public issue of 8,00,000 equity shares of Rs 10 each at a premium of Rs 20 per share. Production of di-sulphonamide (used in the manufacture of diuretic medications and antibiotics) and n-ndhe-mea (used in the manufacture of disperse dyes) commenced in December 1993 while that of quinalphos (an agricultural insecticide) and carbendazim (a systemic fungicide) commenced in April this year.

The commodity price indices show a distinct acceleration in inflation. There has been a sizeable increase in currency with the public followed by more rapid growth of deposits of banks There is some pick-up in non-food advances of banks, but it is not known to what extent this is a carry over of year-end window-dressing. There was some improvement in the growth of industrial production in December and January, though this was partly due to the low base in the corresponding months of the previous year following the riots/bomb blasts. India imported 238 tonnes of gold worth Rs 11,000 crore and 3,620 tonnes of silver worth Rs 2,400 crore in 1993

RAJASTHAN SPINNING

Expansion Projects

THE flagship company of the LNJ Bhilwara group, Rajasthan Spinning and Weaving Mills is engaged in the manufacture of spun yarn and blended yarn, fabrics and readymade garments. For the year 1992-93 while the company's net sales increased by 20 per cent over the previous year, operating profit rose by 27.5 per cent. Production was also higher with the company producing 10,320 tonnes of yarn (grey and dyed) and 89 7 lakh metres of fabrics as against 9,288 tonnes of yarn and 88.6 lakh metres of fabrics produced last year.

Of the total sales of 4,165 tonnes of yarn from the Bhilwara unit, 782 tonnes of yarn valued at Rs 9 crore was exported. Similarly, out of the total sales of 6,108 tonnes of yarn at the Kharigram unit (which concentrates on export of dyed yarn which has good potential in the international market), 483 tonnes valued at Rs 5.9 crore was exported. Fabric exports from the Kharigram unit touched 1 6 lakh metres valued at Rs 1.2 crore out of a total sale of 96.2 lakh metres valued at Rs 46.4 crore. Total exports of the company (a net foreign exchange earner) rose by 22.8 per cent over the previous year.

Despite the improved operations of the company, the heavy interest burden coupled with the high depreciation charges have taken their toll on the company's bottomline. In a bid to streamline its working capital management the company has reduced its current assets by 8.4 per cent over the previous year bringing down their percentage to total assets from 53.6 per cent in 1991-92 to 49 per cent in 1992-93 Despite a 47.2 per cent fall in net profit the company has raised the dividend rate from 14 per cent to 25 per cent.

Meanwhile the company has added 12 second-hand sulzer weaving machines at its Kharigram unit at a total outlay of Rs 3.9 crore which are already in full production. With the rising demand for polyester/viscose (p/v) yarn in the international market, exports from India have also picked up from a mere 50-100 tonnes in 1986 to 16,287 tonnes in 1992-93 out of which the company's exports accounted for 3,866 tonnes. Demand for polyester/cotton yarn is also on the increase. In order to take advantage of the growing domestic and international demand the company is expanding its spinning facilities at Banswara by adding another 9,216 p/v spindles to the existing 18,576 spindles. It is also setting up a project for installing 9,216 spindles for manufacturing polyester/cotton yarn at the same unit at a total cost of Rs 24.3 crore. In order to cater to the melange yarn market, the company is setting up 9,216 spindles at Bhilwara at a total cost of Rs 22.9 crore. Further, it also plans to diversify into rock phosphate and granite.

For the first six months of the current year (1993-94) the company earned a net profit of Rs 5.4 crore on a net sale of Rs 102.5 crore as against a net profit of Rs 2.9 crore on net sales of Rs 75.5 crore in the corresponding period last year. Encouraged by its excellent performance for the first half of the current year the company has declared a 1:1 bonus. The company also has plans for a $ 50 million Euro-issue to finance its expansion projects. Meanwhile the company's Gulabpura and Banswara units have received ISO-9000 certification, the former becoming the first Indian composite textile unit to do so. The performance of the company in the second half is expected to be even better with the commissioning (ahead of schedule) of the expansion projects undertaken by it. Further the company has also entered into a memorandum of understanding with the Himachal Pradesh government for setting up two hydel power plants of 86 and 192 mw capacity respectively.

PASUPATI ACRYLON

Successful R and D

A leading manufacturer of acrylic fibre in the country, Pasupati Acrylon improved its performance considerably in 1992-93. While the company's net sales increased by 24 per cent over the previous year, operating profit rose by 37.3 per cent. A fall in interest charges and a lower increase in depreciation provision coupled with a zero tax provision (as in the previous year) led to a 567 per cent jump in net profit. The company achieved a 97 per cent average capacity utilisation in 1992-93 as against a capacity utilisation of 79 per cent in the previous year.

The major de-bottlenecking programme undertaken by the company at its unit in Thakurdwada was completed leading to an increase in capacity from 15,000 tonnes per annum (tpa) to 18,000 tpa. The cost of setting up the incremental capacity was reportedly a mere Rs 20,000 per tonne as against the estimated cost of Rs 1.25 lakh per tonne for setting up a new unit. The company has also completed the addition of one thermostretching line to produce more high shrinkage fibre enabling it to offer a better product mix to its customers.

Meanwhile the company's equity capital has increased to Rs 63.5 crore following its rights issue of equity shares aggregating Rs 18.1 crore made to part finance its capital expenditure.

The company's R and D efforts have resulted in partial substitution of imported tonner and spin finish. It has also developed adhesive and polyacrylamide from acrylic fibre waste leading to zero waste. The company produces wet spun acrylic fibre under the wet process technology of Snia BPD belonging to the Fiat group of Italy which enjoys an edge over the dry spun fibre due to lower capital cost and ease in dyeing brighter colours (which are preferred in India) at a cheaper price. With the acrylic fibre industry achieving an annual growth of 15 per cent, there has been a perceptible shift in demand from wool to acrylic fibre. As the company imports its raw material, namely, acrylonitrile and dimethyle formamide, it has resorted to forward covering to minimise loss on fluctuation in the exchange rate.

For the first six months of 1992-93 though net sales of the company fell by 8.3 per cent over the corresponding period last year, net profit was stable at around Rs 2.5 crore.

MODERN SUITINGS

Rise in Exports

A part of the Rs 300 crore Modern group, Modern Suitings markets its products under the brand name 'Amadeus' and is one of the largest manufacturers of synthetic blended yarn in the country. The company posted a sizeable increase in sales and profitability in 1992-93. While net sales increased by 84 per cent over the previous year, operating profit jumped by a phenomenal 165 per cent over the same period. Even though the figures for the two years are not comparable as the year ended March 1993 is a 15-month period, the annualised increase in operating profit is 112 per cent. Production was also higher with the suitings division at Alwar maintaining accelerated growth and the company's new 100 per cent export-oriented denim fabric unit at Ahmedabad commencing commercial production. Increasing resort to short-term loans with the higher working capital requirements and the build up of inventory following higher production, however, led to higher interest cost (up 157 per cent). Further, depreciation charges rose by more than 500 per cent leading to a lower rise of 89 per cent in net profit. The company's exports rose by 819 per cent with exports accounting for nearly 20 per cent of net sales as against only 4 per cent last year. Encouraged by its

* 15 months ** 18 months

performance the company raised the dividend rate to 25 per cent

As part of a restructuring scheme the suitings division of the company has been merged with a group company, namely Modern Syntex The rationale behind the merger is that the latter will save a considerable amount on sales tax as it earlier supplied raw material to the suitings division Further the merger will also enable Modern Suitings to concentrate on denim manufacture and exports

During the year under review the company revalued its Alwar unit's assets resulting in an increase of Rs 16 3 crore in their value With the final conversion of the 14 per cent fully convertible debentures issued earlier by the company equity capital nearly doubled to Rs 24 6 crore

Meanwhile plans for a tie-up between Modern Denim (the new 100 per cent export-oriented unit) and Levis of USA may come a cropper with the latter receiving government approval for setting up a 100 per cent subsidiary in India

KALYANI SHARP INDIA

Growing Competition

A joint venture between Bharat Forge and Sharp Corporation of Japan Kalyani Sharp India which markets its products under the brandname Optonica holds fourth position in the television set sector commanding a 6 per cent market share The company also has a technical collaboration with Sharp Corporation which holds a 40 per cent stake in the company In line with the declining market for consumer electronics in 1992-93 the company saw a 12 6 per cent fall in net sales mainly due to a sharp fall in sale of VCRs/VCPs from Rs 37 5 crore in 1991 92 to Rs 13 3 crore The popularity of cable TV which has ensured the company's success in the colour TV/B&W TV set sector ironically has led to the sharp drop in its VCR/VCP sales The higher production cost led to pressure on margins leading to a drastic fall of 95 5 per cent in operating profit The heavy interest burden which accounted for 10 9 per cent of net sales and the 20 per cent higher depreciation provision which was mainly due to the VCR plant could not be adequately compensated by an increase in sales leading to a net loss of Rs 9 7 crore as against a nominal profit in the previous year On the export front however the company performed better exporting 3 575 VCRs [illegible] more

[illegible] VCR/VCPs [illegible] in the near future the company's VCR project which is under implementation [illegible] setback with the company [illegible] the remaining implementation [illegible] over the

company claims to have initiated steps to restructure its operations by reducing production costs, changing the product mix and introducing new products In line with this strategy the company has introduced a series of audio systems christened 'Music Tower' and 'Audio Wall' The additional investment, according to Bhargava, managing director, is only Rs 1 5 crore as the company's existing manufacturing facilities for video and TV equipment can be utilised for production of the new products

The reduction in the CTV excise duty rates and customs duty on components used by the electronic industry in the 1993-94 budget brought some relief to the consumer electronic industry The fast growing replacement market and the increasing popularity of cable TV and other satellite channels is expected to turn the fortunes of this industry However with several world leaders eyeing the Indian market, maintaining the company's market share which has reportedly climbed to 8 per cent in 1993-94 may prove difficult With its restructuring moves the company expects sales to touch Rs 150 crore in the 1993-94 with the new products contributing marginally to total sales For the first six months of 1993-94 the company's net sales increased to Rs 53 7 crore from Rs 44 6 crore in the corresponding period last year and net loss was also lower at Rs 2 5 crore (Rs 5 3 crore)

RPG TELECOM

Value Added Services

In line with the excellent performance of the telephone cables industry RPG Telecom (formerly Karnataka Telecables), which was jointly promoted by the Karnataka State Industrial and Development Corporation (KSIDC) and Asian Cables Corporation, improved its performance in 1992-93 With demand in the industry far outstripping supply emphasis is on higher production The company's factory at Mysore produced 9 69,102 ckm jelly filled telecom cables representing 150 per cent increase in output on an annualised basis (previous year was an 18 month period) while sales rose to 9,57,496 ckm cables A fall in operating expenses led to a 52 4 per cent rise in operating profit Lower interest and depreciation charges led to a steep jump in net profit despite a Rs 4 1 crore tax provision (zero provision last year) for the year The company raised the dividend rate from 36 per cent to 50 per cent in 1992-93

With the target of new telephone connections being revised upwards from 1 5 million connections to 2 million connections, demand for telecommunications cables is expected to rise substantially To take advantage of this the company is increasing its Mysore Factory's capacity from 10 lakh ckm to 18 lakh ckm at a total cost of Rs 18 crore To finance the expansion programme which is expected to be completed in 1993-94 the company recently entered the capital market with a rights issue of equity shares in the ratio of seven shares for every five shares held leading to a rise in the company's equity capital from Rs 4 crore to Rs 9 6 crore

With a view to further consolidate its position in the industry, the company is in the process of introducing a public electronic mail service in collaboration with Sprint International of USA under a licence granted by the Department of Telecommunications (DOT) It also has plans to extend the strategic alliance with Sprint International, a world leader in value added services such as E-mail, EDI and Video conferencing, to telecommunications software Further, it is also examining other profitable diversification opportunities for manufacturing telecommunications equipment With the DOT exploring possibilities of procuring cables, switching equipment and other critical inputs on lease or on deferred payment basis in order to overcome resources crunch, the company has set up a separate company christened, KTL Industrial Finance Company, to take advantage of the opening in the financial services business, i e, lease financing, hire purchase and deferred payment

With the commissioning of the expanded capacity of the Mysore factory the company's production and sales are expected to increase substantially in the current year (1993 94)

Narasimha Rao Visits Jurassic Park

GPD

More than the prime minister and the ruling party, it was the media which were determined to present Narasimha Rao's US visit as an outstanding event and an unqualified success. The reason was that the Indian elite feared that a less than successful visit by the Indian prime minister to the US would jeopardise the economic reform programme.

GOING by all that the media have said and reported and which has been an impressive volume by any standards, Rao's visit to the US has been some kind of an event at least here in India, if not quite in the US. This is not the first time that an Indian prime minister has visited the land of milk, money and green cards. Nor will it be the last. Nehru had gone there. So did Mrs G and Rajiv Gandhi. We have never been to that land of liberty but, going by the difference it seems to have made to Rao, visiting the land of the Chakravartin (emperor of the world) does seem to do a lot of good to the health, confidence and language of the visitor concerned. Not more than twenty-five legislators might have been there to listen to Rao's address to the US Congress, but the rhetorical skills and articulation that Rao demonstrated in that land of semi-educated people like Clinton were remarkable by any standards.

This time, however, Rao had an advantage which Nehru, Mrs G or Rajiv Gandhi did not quite possess in terms of Indian media attitudes. More than the prime minister and the ruling party, it was the media which were keen on presenting the visit of Narasimha Rao to the US as an outstanding event and an unqualified success. Not unlike Clinton, our media masters believe that "the economic reform" initiated by Narasimha Rao and Manmohan Singh has been a great thing to have happened to India. A less than successful visit to the US by the prime minister might jeopardise the economic reform. It was therefore a foregone conclusion that our newspaper fraternity was going to use its great linguistic skills to establish what great success the trip had been. Never before has the Indian prime minister got such a friendly press to cover a visit abroad. It is a safe guess that given this eagerness on the part of the scribes, even a disastrous visit would have been projected as a success. The elite of India cannot afford a situation in which an Indian prime minister's visit to Washington is presented as less than successful. (That it might actually be so is not relevant to the argument here. What are facts anyway?) Once this is understood it is easy to see that a routine, less than colourful visit has turned itself into a significant diplomatic event. That the American media have not seen the visit quite in such glowing terms would underline the point that we are trying to make. Even the famous speech to the Congress was relegated to an insignificant place on page three by a leading American newspaper. If the media are friendly, minor events can turn into major events. In other words, it was a grand success, except that it was a grand success here in India rather than there in the US.

No, we do not mean to suggest that Narasimha Rao's address to the US Congress was not well drafted and clever. It certainly was. The difficulty is that the Americans do not quite have the time for or interest in the linguistic and diplomatic cleverness which marked the speech. They are interested in business and businesslike talk goes down best with them. The Chinese have demonstrated that. Both on the question of nuclear proliferation and human rights they have defined the bottomline below which they would simply refuse to move. It is not clear if India has that clarity and, if it has, whether the Americans have been given to understand that the government of India cannot be a party to an arrangement which undermines national sovereignty (in case of human rights) and equality among states (in case of nuclear proliferation) All that one has read on Rao's visit to the US has not given one any confidence that we have stood (and intend to stay in future) our ground on both these questions.

There are many in this country who think that the human rights and nuclear questions should not and cannot be circumscribed by national sovereignty. But that is neither Rao's personal nor the government of India's official position. Success of a prime minister's visit has to be judged in terms of his government's stated policies. In that context all that can be said is that no further concessions were made during this visit. On the nuclear question, a general position that there ought to be world nuclear disarmament was reiterated. But then what does it really mean? Does it not amount to accepting that there would be only a few nuclear powers for a number of years to come? If so, why shy away from the fact that India cannot be one of them without inviting substantial and irresistible American pressure? Lack of nuclear power status is not and cannot be a major security problem for India. A favourite argument one has heard many times relates to keeping India's options on the nuclear question open. This is a position which does not make much sense. If India (or any other country) does not wish to be a nuclear power, keeping the unusable option open is neither meaningful nor useful. There is reason to believe that the Americans have now understood this. Consequently, Rao's position was close to the American position. This may not be good or bad in itself. The point simply is that Rao merely reiterated Indo-American convergence on the nuclear question. Of course, he did it in good language. But the fact that our foreign policy, like the economic policy, is firmly within the western and American orbit should not be forgotten. That is the success our media are celebrating just as they are celebrating new directions in economic policy. As foreign policy does not usually directly lead to inflation and unemployment and the like, it was easy to do so.

The same thing is true of our 'success' on the Kashmir question. No matter what the American statesmen might occasionally say or do, it would be a fairly accurate guess that the Americans are not and would not be interested in the problem of Kashmir. If the governance in Kashmir were to collapse in future it would be a different story. But otherwise it would be a reasonable calculation to make that the Americans would not be interested in the liberation of Kashmir or Tibet or Punjab. The American attitude has been less than friendly on the Kashmir question, but that has very little operational significance. In other words, US policy has been to keep some distance from the Indian national ambitions. But that does not amount to giving up keeping Pakistan supplied with military help. Rao clearly and understandably drew a blank even on this score.

To be sure, that was only to be expected. It would be difficult to think of a state today which would support India unequivocally on this question. If we wanted to believe (as we seem to) that any state saying that the Kashmir question should be settled bilaterally within the context of the Shimla agreement actually means support to India, nobody can stop us. But little thought would tell us that even the Shimla agreement was an attempt at keeping the issue of Kashmir in suspension. The government of India might get away with it. We do not know. The Americans have

simply decided to play up to the susceptibilities of the Indian elite by reiterating the 'bilateral' nature of the Kashmir problem. There has been a quid pro quo there too. The Rao government decided to accept American sensibilities on the Indian missile programme. We shall not be surprised if the American government were to ignore Rao government's missile exercise just before the general elections in 1996. But whether or not that happens, postponement of 'Prithvi' made our brave statements on keeping the options open less than credible

It was quite a coincidence that Rao left for the US when Spielberg's film 'Jurassic Park' opened in Delhi The Americans are the new dinosaurs of the international system making everyone run for life till their supremacy is accepted. Of course, modern-day dinosaurs do not have to kill. They force everyone to liberalise, liberalise economic and political sovereignty that is. This famous media-friendly trip to Jurassic Park has legitimised the beginnings of the destruction of sovereignty. The process had begun in the finance ministry. Now the PM's visit has underlined the fact that there is political will behind accepting the new world order being dictated and dominated by the American dinosaurs. Spielberg's protagonists have the freedom to run away from the Jurassic Park. Rao and therefore other Indians do not have that freedom. The only freedom is to make our decline look like a successful ascent. So go on slaying with words. The Americans and the transnationals will play with our sovereignty, both political and economic. Our leaders will play with words and make it appear that all is well with potential slavery. Clinton is in Jurassic Park and all is well with the world.

COMMENTARY

NEW DELHI

Under the US Umbrella

B M

What is happening in Indo-US relations cannot be dissociated from the far-reaching shifts in the socio-economic and political priorities of the rulers in New Delhi.

THE portents are indeed turning out to be grim for the economy and polity. The government and its supporters have for long entertained the smug expectation that having agreed to follow economic policy adjustments based, above all, on the opening up of the Indian market for foreign capital, in particular multinational corporations, India under such a new socio-economic and political dispensation will be given a cosy place in the political-strategic global order under the hegemony of the US. The visit of prime minister P V Narasimha Rao to the US should have dispelled any such illusion. But guided by narrow vested interests, there has been a concerted effort to celebrate the visit as a great success.

After the pompous talk of consensus politics, Narasimha Rao has been increasingly adopting aggressive postures in the domestic arena. Abroad, he has been grovelling for favours which he obviously believes may give him some staying power, at least among the upper segments of India's fractured society. These features of the manner of Narasimha Rao's functioning have been further emphasised by his excursion to Washington and his brief 'working' meeting with president Clinton.

The US administration took up, in advance of the visit, highly adversorial positions on sensitive issues such as nuclear proliferation, Kashmir and India's place in South Asia, in particular in relation to Pakistan. But Rao kept saying that he was not aware of any pressure on him. In reply to a question in parliament, he claimed that he did not consider the US demand that India 'cap' its Agni project as amounting to US 'pressure'. There was no worthwhile explanation either of the 'preparatory negotiations' preceding Rao's visit between US and Indian officials in far-away London.

The managed media has been used cynically to project Rao as having returned from Washington 'taller' and 'stronger', but any perceptive observer would have been struck by the obsequiousness of his performance in the US. This became stark in what was called the joint press conference of the Indian prime minister and the US president. Set up after Rao's 40-minute private talks with Clinton, the press conference turned out to be entirely that of Clinton who was forthright and direct in his presentation of the US position in relation to India. The only intervention that Rao made, or was allowed to make, was to deny that his arm had been twisted by Clinton. His arm, he said, was intact and had not been touched by the president.

Those who have applauded Rao for escaping arm-twisting by the US president should know that the art of arm-twisting is more sophisticated than arm-breaking and even Indian policemen try to remember that sometimes. It is significant, in this context, that Rao did not contradict Clinton when he pooh-poohed India's strong protests against Pakistan's terrorist activity in Kashmir. He expressed his disagreement with Clinton's remark that Pakistan's interference in Kashmir had been sealed down only afterwards at a separate meeting with Indian pressmen.

The claim made in Indian official quarters that Rao did not succumb to US arm-twisting since he did not openly concur with Clinton on the question of nuclear proliferation is rather specious. Clinton made it clear that the US was calling on India to give up its nuclear option. He asserted that this would not impair the security of India, for alternatives to nuclear deterrence were available for ensuring security, and pointedly referred in this context to Germany and Japan. This was an open invitation to India to com · under the US protective umbrella. Significantly, before his meeting with Clinton, Rao had already met the US defence secretary and "accepted in principle the US suggestion for military-to-military co-operation". On the Kashmir issue too the spirit of Rao's parleys in Washington was clearly not in tune with the resolution recently adopted with much fervour by the Indian parliament ruling out any talks till Pakistan vacated the Kashmiri territory under its occupation. What has been readily accepted instead are negotiations on the basis of equality with Pakistan as stipulated by Washington. However, to what extent Rao submitted to US diktat on sensitive issues like the nuclear option and Kashmir is yet to surface fully.

Those who talk of Rao's discussions in the US as consisting of two parts, economic and political, are being facile. The suggestion that it was a triumph for Rao on the economic front even as he came through unscathed on the political issues is wholly untenable. Far from the multinational corporations constituting a lobby to promote India's interests in US, they will be coming to India on terms set by them—terms which have become progressively stiffer in the last three years, including guaranteed returns which will ensure full recoupment of capital invested in less than five years even as high profits continue to be repatriated in perpetuity. This is a fool-proof arrangement for mulcting the Indian consumer and exploiting Indian labour and natural resources.

What is happening in Indo-US relations cannot be dissociated from the far-reaching adjustments in the socio-economic and political priorities of the rulers in India. Starting with the launching of the IMF-World Bank sponsored programme for the structural adjustment of the Indian economy in the middle of 1991 and the signing of the GATT treaty, the government of Narasimha Rao has chosen step-by-step to discard what have for long been regarded in India as issues of national concern, economic and political. Such disregard of the imperatives of public welfare is necessarily subversive of the principles of a democratic order. It is not surprising, therefore, that democratic norms in the functioning of the government as well as the ruling party are being cynically violated by Rao and authoritarian ways are being adopted to curb popular discontent as well as political dissent. With his mass base eroding fast, Rao has not hesitated to take all steps—gathering economic vested interests around him, fostering factionalism in his party, arranging defections from other parties, securing the support of foreign powers and interests—in order to entrench himself in the office of the prime minister. This has begun to be affirmed openly by his supporters and publicists after his US visit. Big business interests which have forged close links with multinational corporations enjoy special consideration in official quarters, in contrast to the growing misgivings even among trade and industry circles and their associations with much broader support bases.

In the emerging conditions it would be a grave error on the part of political parties and personalities, especially the forces of the left and the centre, not to take cognisance of the gravity of the socio-economic and political transition being promoted. The need is for a positive political and social alliance on the basis of clearly delineated objectives, political sovereignty and socio-economic development with concern for mass welfare and progress. A broad social and political campaign against the GATT treaty is already making possible some advance in this direction. Rao's visit to Washington and what it portends must reinforce the strivings of all political parties and social organisations to bring about a realignment of political forces. A thorough reappraisal of developments in India's political economy during the 80s, which are unfolding with all their implications and dimensions in the 90s, has now assumed great importance. A view had begun to emerge among the ruling elite in the middle of 70s that having achieved what was described as the mid-stage development of the economy—mass proverty notwithstanding—India should distance itself from the poor developing countries which, after gaining independence, had come together in G-77. It was suggested that India should establish and promote closer relations, economic and strategic, with the developed countries, in particular the US. This also gave rise in due course to hankering for a regional power status for India. Third world solidarity and south-south co-operation ceased, step by step, to be priority concerns of the government's foreign policy. This was the starting point of the so-called 'reorientation' of India's socio-economic development strategy which has become stark in the 90s and is impelling far-reaching changes in the quality and thrust of India's domestic politics as well as foreign policy.

It is not at all surprising that a variety of pressures from different quarters and on different issues have been mounted to circumscribe India's policy options all along the line. There is undoubtedly a thin upper crust in Indian society—vested interests in business, academia and politics—which is keen to partake of the joys of what is called the globalisation of the economy and polity. These interests believe that since India has a large market to offer to foreign multinational corporations, they will be shown some accommodation by the other side in due course. These avid salesmen of Indian labour, natural resources and consumers have gone gaga over their friends in high places in US and elsewhere—for instance, the 22 American multinational corporations which have combined to form an Indian Interest Group and similar other groups abroad, which it is being assumed will show benevolence towards similar interest groups in India. Those who see in a strategic alliance with the US and an open door for multinationals the path to economic growth and modernisation do not hesitate to deride the very idea of national sovereignty. One among them had declared with typical cynicism, when India was forced to accept abject conditions in return for an IMF loan in the middle of 1991, that "a small farmer or landless labourer is willing to grovel and accept any number of conditions in order to get a loan from the local bank or moneylender". The point, as they see it, is that the prime minister's visit to Washington is very much akin to the grovelling of the poor peasant in search of financial support from the moneylender and there is no need to be squeamish about it. Here was the prime minister rushing to Washington on sudden summons from the White House in total disregard of the adverse conditions created by US diplomacy and the strong popular protests against the visit.

Poverty Ratio as a Variable in the Devolution Formula

K Madhava Rao
D Subbarao

The poverty ratio, the way it is presently defined and measured, is a poor candidate for use in the formula for the inter se *distribution among states of the shareable pool of taxes.*

AS the Tenth Finance Commission prepares to finalise its award in the next couple of months, one of the major issues it will have to decide on will be the formula for the *inter se* distribution among states (devolution formula) of the shareable pool of taxes. The formula we now have is the product of refinement by successive Finance Commissions to reflect as accurately as possible the requirement of each state on a normative basis. This formula, giving large weightages to the level of 1971 population and the per capita State Domestic Product (SDP), has been widely accepted to be objective and equitable. However, with each Finance Commission the formula becomes an open question. There has been some debate recently on the candidacy of poverty ratio (proportion of population below poverty line) as a variable in the distribution formula. The purpose of this paper is to evaluate that candidacy.

In our view, a variable must fulfil the following criteria in order to qualify for use in the devolution formula:

(i) It must reflect the extent of backwardness of the state. In other words, it must be a statistically 'good' estimate of the state of well-being or otherwise of the people.
(ii) Its estimation methodology should have a sound conceptual basis free of any value judgment.
(iii) There should be broad agreement on the methodology of estimation. Conversely, the estimate should be robust and unbiased under variations in methodology of estimation.
(iv) The data used for the estimate should be statistically reliable.

Poverty ratio, as a variable, fails the test when evaluated by the above criteria. The strongest objection to the use of poverty ratio is undoubtedly the wide divergence of opinion on its definition and measurement. The official estimates of poverty released by the Planning Commission are anchored in a calorie norm of food intake with disaggregated adjustment for age, sex and occupational structure of the various segments of the population. Indexed to the 1973-74 price line, the estimates have been updated every five years using a deflator derived from the National Accounts Statistics (NAS), which has been found to correspond closely to the weighted price index of the consumption basket of the poor.

Two important characteristics of this poverty ratio estimate warrant explicit recognition. First, it is a single aggregate index for the whole country, presupposing uniform food habits, preferences, calorie requirements, consumer patterns and price trends across the country. Second, although anchored in a calorie norm, the estimate makes an allowance for non-food consumption needs as well but—and this caveat is important—the non-food consumption expenditure is measured by observed consumer behaviour and not with reference to any normative standards.

An Expert Group (EG) appointed by the Planning Commission under the chairmanship of the late D T Lakdawala "to look into the methodology for estimation of poverty at national- and state-level and also to go into the question of redefining poverty line, if necessary" (report datelined July 1993) attempted a refinement in the measurement of poverty ratio by converting the aggregate all-India consumption basket representing the threshold calorie intake into monetary equivalents by using state specific price indices. The EG was sensitive to the fact that this was only a half-way measure. For instance, it did recognise the need for determining state specific calorie norms to account for variations in calorie requirement arising from climate, terrain and occupational structure but could not build it in for want of data. The EG debated the issue of a state specific commodity basket as well to allow for differences in food habits as also preferences between food and non-food consumption but decided to stay with a standardised commodity basket "in order to enable comparability across states and over time".

The findings of the EG are striking not only because of the extent of divergence from the official estimates but also because of the change in the *inter se* ranking of the states as per the poverty ratio. Table 1 indicates the official and EG estimates of the poverty ratio for 1987-88 along with the per capita State Domestic Product (SDP) for the 17 major states. Even a purely heuristic assessment would reveal that there is no correlation between the two different estimates of the poverty ratio or between either of the estimates and the per capita SDP.

It is in this fuzzy background that the candidacy of poverty ratio as a variable in the devolution formula has to be evaluated. It is intriguing that states with higher per capita incomes also have higher poverty ratios and vice versa. Tamil Nadu, for example, has a per capita SDP that is nearly one-and-a-half times that of Rajasthan, but its poverty ratio is also significantly larger than that of Rajasthan as per both official and EG estimates. Gujarat and Tamil Nadu, to take another example, have roughly the same levels of per capita SDP but differ vastly when compared by the estimates of poverty

TABLE 1: PER CAPITA SDP AND POVERTY RATIOS, 1987-88

State	Per Capita SDP at Current Prices (Rupees)	Poverty Ratio: Planning Commission	Poverty Ratio: Expert Group
1	2	3	4
1 Bihar	1904	40.8	53.0
2 Orissa	2194	44.7	57.9
3 Rajasthan	2310	24.4	32.0
4 Uttar Pradesh	2362	35.1	47.6
5 Assam	2589	22.8	29.6
6 Madhya Pradesh	2657	36.7	46.1
7 Andhra Pradesh	2869	31.7	26.1
8 Kerala	2888	17.0	28.5
9 Jammu and Kashmir	2954	13.9	39.5
10 Karnataka	3181	32.1	39.5
11 Himachal Pradesh	3185	9.2	13.8
12 West Bengal	3247	27.6	33.5
13 Gujarat	3264	18.4	22.0
14 Tamil Nadu	3374	32.8	40.7
15 Haryana	4387	11.6	17.3
16 Maharashtra	4647	29.2	35.8
17 Punjab	5719	7.2	14.3
All-India		29.9	38.0

ratios. Surprisingly, some of the states with high poverty ratios such as Maharashtra and Karnataka actually enjoy a surplus in their non-plan accounts even before devolution.

A possible explanation for this counter-intuitive finding is that states with lower poverty ratios have more equitable income distributions. Notwithstanding the causal relationship posited between poverty and inequality, to assume a positive and strong correlation between the two indices across all the states of the country—which after all are artificial geographic entities—will be highly questionable. Even granting the existence of a causal relationship, a devolution formula based on poverty ratios would in this scenario tantamount to not so much helping backward states as to rewarding states which have made no effort towards more equitable income distribution.

Inasmuch as the Finance Commission is mandated to build into the devolution formula a bias in favour of backward states, the question to be asked is to what extent the poverty ratio of a state reflects its 'backwardness'. If poverty ratio were a 'good' estimate of the level of deprivation of the people, it would be reasonable to expect a rough correlation between a low poverty ratio and indices of 'quality of life'. Table 2 shows a comparative picture of the per capita SDP, poverty ratios and some broadly accepted indices of human well-being for the four southern states. Andhra Pradesh with a lower poverty ratio than Tamil Nadu under both official and EG estimates curiously lags behind Tamil Nadu in all the four indicators of quality of life. The correlation between poverty ratio and human well-being is striking—by its total absence. The use of poverty ratio as a measure to help backward states under these circumstances would not only be indefensible but also grossly unfair.

Anchored as it is in a calorie norm, the poverty ratio is at best an indicator of 'food poverty'; it clubs the hard core poor with the marginally poor and as such is a bad proxy for the state of well-being of the people. This latter variable depends, apart from personal consumption pattern, on items of social infrastructure such as hygiene and sanitation, potable drinking water, availability of power and access to health and education, etc. In his supplementary note to the EG Report, P V Sukhatme explains how the productivity of a person is a function, not of the quantity of food taken, but of the food absorbed. Food absorptive capacity, in turn, is critically dependent on the quality of social infrastructure mentioned above. It is perfectly possible, says Sukhatme, for a person to be taking food at or above the 'poverty level' but still getting trapped in a vicious circle of low levels of health and productivity—because of low quality social infrastructure. Conversely, a person with food consumption level even below the poverty norm may be enjoying higher levels of productivity and health as a result of higher absorption capacity made possible by access to social infrastructure.

More comprehensively, social infrastructure should also include access to amenities such as post office, telephone, railway and bus connection, roads, power, markets, entertainment, fire and police protection, access to legal systems, etc. The ability of a state to improve and expand social infrastructure is a function of the quantum of public expenditure on these sectors and the efficacy of its delivery systems. It is the capacity of the state in providing social infrastructure that the Finance Commission should focus on. It has been hypothesised that the quantum of public expenditure in these sectors is positively correlated with per capita SDP. Even without rigorous economic analysis, the data at Table 3 pertaining to the four southern states appear to bear out this hypothesis. Inasmuch as the Finance Commission's intention is to ensure that all states are capable of providing basic minimum needs for human well-being, the devolution should be based on per capita SDP. Poverty ratio is an unsuitable variable.

There is another major reason that makes poverty ratio a subjective, arbitrary and questionable indicator of the nature or extent of backwardness of a state. As mentioned earlier, the NSS data, on which poverty measurement is based, records 'actual' expenditure on food and non-food consumption items. A poverty measure derived from this data therefore fails to capture the impact of subsidised provision, if any, of items of social consumption such as health, education, sanitation and housing.

It is possible, and indeed highly probable, under this system of measurement for two persons with personal consumption expenditures at the threshold poverty level to be enjoying vastly different 'levels of well-being'. It is even possible that a family below the poverty line in a 'richer' state has a better quality of life in terms of health and education than a family above the poverty line in a 'poorer' state. If the guiding principle for the Finance Commission's award is to help backward states come up to the minimum normative levels in social infrastructure, any devolution based on poverty ratio would militate against this principle.

To summarise, poverty ratio, the way it is presently defined and measured, is a poor candidate for use in the devolution formula for a variety of reasons. First, because it is a distorted indicator of (a) the state of well-being of the people; (b) the nature and extent of backwardness of a state in terms of social infrastructure; and (c) the ability of the state to provide social infrastructure at the accepted normative level.

Second, there is as yet no unanimity on the methodology for the measurement of poverty ratio as evidenced, for example, by the divergence in the official and EG estimates. While using any estimate of poverty in the

Table 2: Poverty Ratio, SDP and Indices of Quality of Life

State	Per Capita SDP at Current Prices (Rs)	Poverty Ratio: Planning Commis-	Poverty Ratio: Expert Group	Infant Mortality (1988)	Birth Rate	Death Rate	Literacy Rate (1991)
1	2	3	4	5	6	7	8
1 Andhra Pradesh	2869	31.7	26.1	63	27 4	10.2	44.1
2 Kerala	2888	17.0	28 5	22	20 3	6.4	89.8
3 Karnataka	3181	32.1	39.5	46	28.7	8 8	56.0
4 Tamil Nadu	3374	32.8	40.7	51	22 7	9 3	54.6

Notes: (i) Data relate to the year 1987 unless otherwise specified.
(ii) Data in columns 5, 6 and 7 are per 1,000.
(iii) Literacy rate is percentage of literate population in total population aged seven years and above.

Population, 1981 Census.

devolution formula would be erroneous, using the EG estimate would be indefensible. The refinement introduced by the EG is somewhat of a half-way house and cannot be accepted unless the refinement is carried to its logical conclusion by way of (a) state-specific calorie norms taking into account variations in climate, terrain and occupational structure, (b) state-specific consumption baskets reflecting inter-regional preferences; (c) state-specific and income-specific ratios (indifference curves) for preference between food and non-food items of consumption which in turn would reflect the quantum and quality of social infrastructure, and (d) normative standards for non-food consumption without reference to actual behaviour

Lastly, while considering the issue of poverty ratio, the Tenth Finance Commission cannot ignore the deliberations of its predecessor commissions Significantly, the Eighth Finance Commission categorically rejected poverty ratio as a variable in deference to the reservations expressed by many states along the above lines The Ninth Finance Commission too gave up using the poverty ratio after initially toying with the idea in its first report Even the Expert Group cautioned against the use of poverty ratio in the award of the Finance Commission—"considering that there could still be differences in views about definition and measurement of poverty, we are not in favour of using these estimates to derive any 'poverty criterion' in such an important matter as the *inter se* allocation of financial transfers to the states"

The devolution formula as awarded by the Eighth and Ninth Finance Commissions is largely a function of the size of the 1971 population and the per capita SDP The search for another variable arises from the concern of the Finance Commissions that these two variables do not adequately reflect the capacity and financial needs of the states Besides, a third variable of inter-state disparity will help in neutralising the biases, if any, underlying the conceptual basis and measurement methodology of these two variables which appear in the devolution formula with large weightages This is surely a legitimate concern However, for the reasons presented above, poverty ratio does not qualify as a suitable supplemental variable

As a supplemental variable, the Ninth Finance Commission devised a composite index of backwardness which is a combination of two other indices, the absolute levels of agricultural labour and of scheduled castes and scheduled tribes population and reflects more accurately the quantum of burden on the different states in providing 'social safety nets'. It has also been widely accepted as a more accurate and robust estimate of the need and backwardness of the states. The Tenth Finance Commission will be well advised to stay with this composite index of backwardness.

Politics of 'Sustainable Development'

K R Nayar

The politics of 'sustainable development' lies in its being anti-south, anti-poor and, thereby, anti-ecological.

THE 'eternal return of ideas' in environmental debate is due to two basic reasons. The concepts and approaches advanced to grapple with environmental problems are too global to be operationalised in any meaningful way. Secondly, those who are engaged in the debate are a handful and polarised. The dominant ideas get carried over, even if approaches change, through international parleys.

The currently fashionable 'buzz word' in the international environmental lobby as well as national policies on environment is sustainable development. It is interesting that the concept of sustainable development has emerged from those countries which themselves practice unsustainable resource use. While it is true that the present growth trends cannot be sustained for long, the concept does not articulate a well-defined strategy for action.[1] It thus remains an accepted philosophical approach but in a vacuum.

Eco-Development Approach

Compared to a much more resilient third world facing the onslaught of globalisation at present, the Stockholm Conference of 1972 echoed the ideological cleavage between developed and underdeveloped countries when India declared 'poverty as the greatest polluter' and attacked the developed countries for the ruthless plunder of resources of other countries for reaching the present levels of affluence. This view was supported by many countries in the third world, including a moderate Philippines and a radical China.[2] Although dubbed as inflammatory rhetoric, the ideological and political nature of environmental issues were underlined by this frontal attack on the developed countries. Despite the voluntary absence of Soviet Union and the east block in protest against the non-inclusion of GDR as a conference participant, the Stockholm Conference did initiate some positive approaches to environment.

One of the more positive approaches was perhaps initially radical concept of eco-development. The positivity of eco-development was that it focused on the satisfaction of basic needs in an environmentally sound production system. The achievement of self-reliance needed for such a production system was the basis of eco-development approach.

The third world, however, lost the war of words against the mighty ideological war-heads of the west during the post-conference era. The proliferating literature on environment and its feverish pitch was a pointer to the political and economic significance of their approach to environ-ment. Environment became a political auditorium to preach a way of thinking that did not envisage any change in the fundamental structures of society. Most of the literature of this era carried a world-view imbued with an over-riding concern for population growth in the south, thereby turning a blind eye to the non-sustainable resource intensive production system of the north and its implications for environment.[3]

The post-conference period belonged to intellectual groups, the foremost among them being the Club of Rome and its cronies. These were then joined by academics, especially ecologists such as Ehrlich, Eckholm, Hardin, etc. Despite the ideological bickerings and the assaults on the south by the intellectuals of the north, the Cocoyoc declarations in 1974 reiterated some of the concerns of the south which had been voiced in the Stockholm Conference. The declarations, while noting the evils of the market system which flow from the affluent countries and the existence of an international power structure and its role in perpetuating poverty in under-developed countries, called for new life-styles and modest pattern of consumption among the rich. It also recognised the necessity of satisfying basic human needs for maintaining eco-balance, especially with regard to planet's physical resources.[4]

Both the Stockholm declaration on human environment and the Cocoyoc declarations contained an ecological vision combined with third world demands for development and social justice. The Stockholm declaration, especially principles 1, 9 and 11, was totally in favour of developing countries.

The radical tone of such principles, however, did not materialise in any positive action programmes. For instance, the positivity of eco-development was subverted in the subsequent action programmes by emasculating the component of self-reliance.[5] Self-reliance, considered too political, would have tilted the balance of international power structure in favour of the south which was dependent on multinational companies. Allowing self-reliance of the south meant losing the dominance, and therefore it was redefined as micro self-reliance keeping the macro dependency intact.

It was in this backdrop that the world commission on environment and development was set up by the UN General Assembly. The commission came out with the report entitled 'Our Common Future', which was adopted as a resolution of the General Assembly along with a resolution on environmental perspective to the year 2000 and beyond.[6]

Sustainable Development

Sustainable development as an approach to environment came to the forefront after the WCED report, although the concept had been espoused earlier in the World Conservation Strategy.[7] According to WCED report, it implies meeting the needs of the present without compromising the ability of future generations to meet their own needs. The means of achieving or identifying alternative paths towards sustainable development are kept vague to enable varying interpretations. A few attempts at redefinitions are indicative of the palpability of the concept.

One such attempt locates the aim of development in the third world countries in improving the quality of life through actions focused on educational attainment, nutritional status, access to basic freedom and spiritual welfare, etc.[8] Sustainability therefore suggests that what is needed is a policy aimed at making these developmental achievements last well into the future. The unstated assumption of such a definition, obviously, is that unsustainability in the third world would result from actions in the realm of quality of life because of 'unbridled' population growth. The question is whether natural capital stock which includes all environmental and natural resources assets would be affected by concerns of quality of life or satisfaction of basic needs. The means to achieve sustainability in this neo-classical framework is wrongly addressed, and therefore the starting point for turning the present unsustainable practices to sustainable ones even with respect to third world is problematic.

Even a statement such as "if needs are to be met on a sustainable basis, the earth's natural resources must be conserved and enhanced" [WCED, p 57] is not as innocent as it sounds. The 'need' with reference to sustainable development is affluence rather than basic, or opulence rather than squalor. Because, when basic needs become an integral component of a developmental model, the question of unsustainability does not arise.

Thus the cyclical relationship between poverty and environmental degradation is conceptualised in simplistic terms. The assumption is that "as poverty increases, natural environments are degraded and when environments degrade, the prospects for further livelihood decrease, environmental degradation generates more poverty, thus accelerating the cycle". While the basic factors which generate poverty are kept outside this framework, it also does not consider the role of lopsided development which degrades the 'natural' capital, and the issue of artificially inflated impact of the poor on an already

lower quantity of 'natural capital' set in motion by factors other than poverty.

While the issue of population growth is implicit in the above model, there is another neo-classical approach, the ECCO model or Enhancement of Population Carrying Capacity Option, which is anchored on a neo-Malthusian framework. It focuses on the capacity of given territory to sustain a given population with a given quality of life, cultural particularity and foreseeable impact on the environment. Four key concepts—population, resource, environment and development—are thus linked and projected over a long-term time scale within the context of sustainability.[9] Drawing upon the Brundtland Commission report which states that sustainable development can only be pursued if population size and growth are in harmony with the changing production potential of the eco-system, the model attempts to link up carrying capacity with sustainable development. Sustainable development for the group implies that the various components of the system are interacting in such a way that all inputs necessary to secure the needs and aspirations of the population can always be procured at a rate corresponding to the rate of population increase.[10] The implication, of course, is more 'deliberate action' or stringent action in population control to make the system more sustainable.

The basic assumption in these models, that of a linkage between environmental degradation and population growth, will hold good only if it can be shown that population growth intensifies unsustainable development leading to environmental degradation. In this context, it has been convincingly argued that concurrence of rapid population growth and environmental degradation does not necessarily reflect a direct, causal connection between them.[11] Commoner argues that environmental quality is largely governed, not by population growth, but by the nature of the technologies of production.[12] Any action on sustainable development can, therefore, be initiated only with an understanding of the existing models of development and the demand they make on natural resources. It has to be anchored on the production relations which govern societies.

In this connection, there is a close association between sustaining world capitalism and sustainable development approach. The ecological non-viability of the present capitalist world enterprise is an accepted fact. Sustainable development is visualised as a solution to make available raw materials on a continuous basis so that the production system, the expanding market and the political system are not threatened. The raw materials in the developing countries, therefore, need to be protected and their population growth curtailed so that resources would remain easily available.

The ecological movements in the west are in themselves a major political factor behind the emergence of the concept of sustainable development. The Not-in-My-Back-Yard or Nimby syndrome is mainly responsible for ecologically unsustainable development projects including hazardous industries shifting out of these countries to developing countries. When the aim is to suggest patchwork solutions to the unsustainable production system of the north, population growth in the south automatically becomes the target of the debate on sustainable development.

Rather than blaming victims of depleting common resources, the votaries of sustainable development should address themselves to the production and consumption pattern in the industrialised countries which is leading to destruction of natural resources in the world. In the developing countries, sustainability is not linked to consumption of their own people (rather they help to maintain consumption levels in the north) but to subsistence of the vast rural masses who have hitherto been following sustainable practices because these were the only guarantee of survival.[13] In this connection, the earlier concept of eco-development was better conceived since it focused on self-reliance. But it was discarded because it was anti-rich. The idea of sustainable development will become pro-poor only if it starts with the affluence and the resulting unsustainability of the rich. A reorientation of the growth models in the north would enable the poor countries to achieve at least a minimum level of development while influencing, in the process, the path of development in the south itself.

We will end this section with a quotation from the speech of Fidel Castro at the Rio summit: "A consistent interpretation of sustainable development should begin with the recognition that underdevelopment is the result of plundering of the third world, which has been prolonged in our time by an international economic order that uses the mechanism of debt, unfair division of the world's labour, trade protectionism and control over the flow of finances to heighten the exploitation of the underdeveloped nations, and as a consequence, the ensuing ecological degradation."[14]

Sustainable Development and Environmental Policy in India

At the international and national levels 1992 was a vibrant year for environmental initiatives. The national conservation strategy and policy statement on environment and development was presented to the parliament during this period.[15] Looking through the strategy, one finds the global thinking on environment being merged into the local environmental issues. Sustainable development is a key word in the strategy. The strategy recognises the negative effects of the process of development and those arising from conditions of poverty and underdevelopment, but it does not take notice of the incompatibility of the existing models of development with the sustainability of environment.

Another issue noted in the policy is that concerning appropriate managerial approaches to sustainability. However the suggested approaches remain the ones that can be labelled as 'protective and reactive responses'.[16] They are plans aimed to diffuse the contradictions of the developmental model. Such approaches to environmental management, as Redclift says, based as they are on the experience of the developed countries, are not politically neutral. They are linked to the interests of the establishment. It is convenient to manage problems as discrete entities by taking corrective rather than directive efforts.[17] The problematic of sustainable development lies here, in operationalisation of a vision without ethics, care and concern.[18]

The conservative concern for environmental balance is also reflected in the strategy which in no way articulates the initial aggressive postures adopted during the Rio conference. The strategy in the opening paragraphs itself advocates vigorous drive for population control, while adopting the neo-Malthusian framework of 'carrying capacity'. The oft-repeated rationale for controlling population numbers, one of the contentious issues between developed and developing countries for the alleged role in contributing greenhouse gases, is contained in the environmental perspective of our own country.

Conclusion

The politics of sustainable development is now more transparent. It is deeply rooted in the very conceptualisation of the approach, which is ill-defined and vague. This allows for the manoeuvrability of the concept depending on one's inclinations. We have argued that the distinctions between the developed and underdeveloped have to be maintained in its operationalisation. If the distinctions are recognised, the starting point for sustainable development are the countries of the north which, through the present high levels of consumption and polluting technologies, damage not only their own environment but even that of the south. The developed countries owe unlimited ecological debt to the underdeveloped countries for maintaining their affluence.

A sustainable development for the south cannot at the same time ignore the fact that the present models of development do not cater to the needs of the vast majority.

Bringing the notions of population growth and carrying capacity into our own national environmental strategy is tantamount to what the north would consider a 'safe' approach to sustainable development "with the obvious interest of watering down their own considerable responsibilities within a world context".[19] In one word, the politics of 'sustainable development' is that at present it

is anti-south, anti-poor, and thereby anti-ecological.

Quest for an Environmental Value System

L Balasubramaniam

Dealing with environmental degradation through technological fixes and the legal-judicial machinery without developing and propagating an environmental value system will not lead to success.

IT is only the evolution of a universal environmental value system that could save the environmental movement from gradual extinction. without a value system environmentalism will fare no better in this country than has fared another alien doctrine, communism. Communism ekes out a meagre existence drawing sustenance from the structural defects of our system which have led to sharp income disparities, widespread poverty and unequal development. In the absence of a value system environmentalism too would have at best a peripheral existence, the sole justification for its presence being the widespread environmental degradation. It will never become a way of life for the people. That will be a major failing of the movement, for bringing about a radical change in one's outlook towards one's surroundings and in one's perception of one's place in the scheme of things is what environmentalism is all about.

Dealing with environmental degradation through technological fixes and the legal-judicial machinery without bringing about this change in outlook will lead to nowhere.

laws of society, such as not trespassing onto other's property, not stealing, or not telling lies, are obeyed not because of fear of the law-enforcing machinery but because people generally subscribe to a value system sanctified by tradition which prohibits these actions. Similarly, if anti-environmental actions are to be prevented, there is an indispensable need for a value system that prohibits such actions. In the absence of such a value system no amount of environmental laws and law-enforcement machinery can prevent environmental degradation.

The link between an action prohibited by a value system and the ill effects of the action may not always be self-evident. A case in point is the ban on cow-slaughter imposed by Hindu religion. The ban is couched in so much religious and philosophical conceptualisation, roping in the doctrine of ahimsa for good effect, that the link between the ban and the significance of the bovine species to an economy dependent on it for food, fuel and motive power is almost lost sight of. But the link is very much there. It was essential to preserve the cow for the economic well-being of society, and this has very effectively been achieved by Hindu society. So much so that even today no self-respecting Hindu will consider the killing of a cow, whatever may be the gains.

What is of interest to us is the methodology used by religion to impose a rule such as this and elicit total compliance to it from the people. It speaks for the strength of the Hindu religion that its religious diktat has been scrupulously followed for more than five millennium and there is no sign of possible disobedience in the near or distant future. The process of articulating and imposing the diktat is even more fascinating and educative. The taboo against cow-killing has been expertly corroborated by an elaborate philosophical system, eulogised by role-model figures in major religious epics, and distilled into the moral code of Hindus. In the process, a humble animal has been nearly deified.

The lesson to be drawn here is that environmentalism too needs to acquire such authority over the minds of humanity, have the power to issue diktats and have the means to ensure that these are scrupulously followed. For this to happen, environmentalism must develop for itself a value system and legitimise it by a process followed more-or-less by all religions, i e, develop a body of 'sacred' literature in an appropriate language (not English), a pantheon of divinity, mythical characters and role-model figures, a respected priesthood, the equivalents of temples and pilgrimage spots (Silent Valley and other environmental success sites could serve as starting points), and so on; in short, the complete spectrum of the religious paraphernalia.

It needs hardly be said that environmentalism is light years away from reaching that stage of development. Take the simple example of the well-established link between cutting down a tree and the host of environmental ills that result from it. The link between the two phenomena is more explicit than the link between killing cows and the economy. Even then, how many villagers or contractors can environmentalism prevent from axing down a tree? Or take the case of CFCs used in air-conditioners and the ozone depletion they cause in the upper atmosphere. How many comfort-seeking, 'committed', urban environmentalists can environmentalism persuade to give up air-conditioners in their homes and offices? What this proves is that environmentalism is way behind developing a value system that holds sway over even those who owe allegiance to it.

This is where environmentalism has failed, not only in India, but also in the world. It continues to stagnate at the scientific-logical stage of existence; that is, it has to appeal to logic and reason for getting acquiescence to its principles, and has not been able to progress to the next higher level where acquiescence is ensured by allegiance to a widely accepted system of values. Such a value system has nothing to do with science or logic but belongs to a different realm altogether, the realm of religion, ethics and morality.

For example, consider the following environmental home-truths which need to be

widely followed to save the environment: trees should not be cut because they hold the soil together; CFCs should not be used because they deplete ozone; biodiversity should be preserved because it is the repository of priceless genes. These are logically/scientifically true but are bland statements that do not have the backing of a value system. They do not have the power to move a man to do something, or restrain him from taking harmful action. In the absence of a motivating and sacrosanct environmental value system, these home-truths remain mere statements whereas statements such as, cows are sacred (in the case of Hindus), or pork is unclean (in the case of Muslims), or use of tobacco is to be avoided (in the case of Sikhs) command widespread respect and obedience.

Environmentalism has set before itself the ambitious goal of saving mankind from ecocide. But it has not succeeded in developing the means and mechanisms commensurate in reach and strength with the loftiness of its goal. The most basic and at the same time the most powerful tool that it should have but does not is a value system which compels the entire humanity by the force of its appropriateness to the business of survival to adopt it unconditionally and exclusively There can be no better way of regulating human action so as to promote the maximum good to the environment and thereby to mankind. Once such a value system is in place, half the environmental battle is won, for what remains then is the less onerous task of remodelling existing institutions and societal structures in the light of this new value system.

Few attempts are being made by environmentalists to develop such a value system. Instead, Indian environmentalists still seem to be caught in the web of imported environmental values. So hopelessly entangled are they in this web that they cannot perceive that no value system based on the western civilisation can ever form the basis for a universally applicable environmental value system (an environmental value system by its very nature has to be universal and applicable to the whole of humanity), for environmental problems have resulted from certain deep-rooted, fundamental flaws in the western value system. These flaws have so shaped our perception of the outside world as to make us see in it inexhaustible treasures waiting to be looted for our well-being. Much has been said on this man-centredness of western civilisation to merit a detailed analysis here. It suffices to say that keen environmental thinkers in the west have come around to granting this flaw in the traditional value system of the west and are in search of a way to overcome it.

It is in this context that Indian environmentalists find themselves in a very favourable situation by virtue of belonging to a tradition that is fundamentally different from the western one. However, many Indian environmentalists have frittered away this advantage by steeping themselves in the very same western tradition which has to be eschewed if a universally accepted environmental value system has to be developed.

What could be the contours of this universally applicable environmental value system? In India we very frequently see attempts by environmentalists to establish the environment-friendliness of the Indian value system. They cite the nature of poetry of the vedas, the worship of animals and plants, and the 'frugal life-styles of the Indians' to justify the claim that Indians are essentially more environmentally proper than the westerners. The latest mantra discovered by our ethnic environmentalists is the 'Prithvi Sukta' of the *Atharvaveda* which is being unfailingly bandied about in all their seminars and writings.

The tendency to prove our traditions to be all-encompassing is an old one. In earlier times, formulae for the making of a variety of modern gadgets ranging from the aeroplane to the atom bomb have been discovered by enterprising researchers in our ancient scriptures. The famous stanza of the *Mahabharata* stating that what is not in this great epic does not exist in this world, and what exists in this world is to be found mentioned in it lends credence to these claims. When Indian environmentalists come up with gems such as the 'Prithvi Sukta' (earlier it was the Ashoka edicts) from time to time from their churning of the scriptures, they are merely exhibiting an age-old Indian tendency and are not to be taken seriously.

In fact, they do more harm than good, for they lay open the environmental movement to the charge of irrelevancy. For, if being a good Hindu is equivalent to being a good environmentalist, then why should one not merely be a good Hindu and forget all about being a good environmentalist? In short, environmentalism invites a terrible identity crisis upon itself, a crisis that has cost many a lesser religious sect in earlier times its very existence. Taking advantage of its irrelevance and ambiguity, Hinduism has unceremoniously assimilated the upstart sect into its voluptuous fold without even leaving a trace of it.

Therefore, the issue that environmentalists need to take up earnestly is not in what way are environmental values similar to religious values, but in what way they are different. They will have to enter into the specifics of it. As an example, the environmental value system will have to find a better reason other than the scientific or religious one for not cutting down a peepul tree.

There is very little evidence of Indian environmentalists having even begun to address the problem of evolving a value system for their movement. It is even doubtful whether they perceive the significance of the need for such a value system. The reason behind this could partly be that they have not yet succeeded in throwing off the shackles binding their thinking processes to the western environmental movement. It will be sometime before they are able to shake off the foreign influence, do some original thinking on the subject, and get down to the business of identifying the key issues besetting the movement.

The current thinking in the Indian environmental camp seems to be to capture political power at various stages of the political system, with a view to ensuring a more equitable control over common resources such as grazing lands, forests, rivers, mountains and so on, and also to establish an effective lever within the decision-making bodies so as to be able to influence the decisions to favour environmental interests. Efforts at introducing cosmetic changes in the judicial system and enacting new and more stringent environmental laws and organising their enforcing machinery are also being given importance. If one were to look at the trajectory of the westerm environmental movement, the *raison d'etre* behind these developments in India immediately become clear. Indian environmentalists are merely aping the western environmentalists, particularly the German and their Green Party.

The danger in developing a stake in the present political system is that the environmental movement then becomes a part of the establishment. It is this very value system which has created the environmental problem in the first place. Further, many existing institutions including the very polity may have to be remodelled to suit the new environmental value system. If environmentalists develop a stake in the existing system such a reformation may become all the more difficult.

Environmentalism which has so far been developing as a new scientific discipline (such as physics, chemistry or biology, in this case environmental studies) has to transform itself into a modern religion that commands the allegiance of the better part of humanity. This religion must become so all-encompassing and appealing as to make existing religions and their value systems superfluous. If we take this as the ultimate aim of environmentalism, it becomes clear how woefully inadequate are the efforts of present-day environmentalists.

Sporadic efforts are on in different parts of the globe to turn the movement towards the new exciting path of religious spiritualism. A notable example is that of the Gaia concept developed by the English freelance scientist Jim Lovelock. According to this fascinating theory, Gaia is an omniscient, all powerful force that controls the biosphere very much like the almighty god of most religions.

Indian environmentalists should bravely enter such new and exciting areas of thought in the very frontier of the environmental movement. Given the rich and varied religious tradition of their land, it is more than likely that they can come up with some unique concept or idea that will give a new definition and direction to the movement.

Naga and Kuki: Who Is to Blame?

Vibha J Patel

In a situation where land disputes, clan and tribal ties and, above all, a secessionist ideology prevail, can the problem be solved by the deployment of the armed forces?

"We are like the birds of the air. We make our nests here this year and who knows where we shall build next year" said a Kuki tribesman, almost nine decades ago, to T C Hodson, Assistant Political Agent in Manipur (*The Naga Tribes of Manipur*, 1911).

THE violent clashes between the Kuki and Nagas in Manipur are a direct consequence of the wandering nature of Kuki tribesmen and the artificial boundaries imposed on them by various rulers. Thus is it correct to put the onus on the Kukis or the Nagas alone? Almost a century and a half ago, the Manipur Metie kings had encouraged the Kukis as well as some Nepalese to settle in certain tracts so as to form a human settlement buffer against raids by various Naga hill tribes—Tangkhul, Angami, Maram, Maring, Kabui, Rongmei, etc.

William Shaw of the Assam Civil Service observed in 1929: "The Thadous (Kukis) who moved up most of the Barak river were utilised by the Sirkar against the Angamis. Those who came up along the hills between the Barak river and the valley of Manipur were similarly used by the Raja of Manipur placing them among the Kacha Nagas, while those on the east were used as a barrier against the Burmese." As a result of these strategic moves the Kangpokpi area in northern Manipur has a concentration of Nepalese settlers and in southern Manipur around Churachandpur there are a large number of Kuki settlements. Later, the British, who had annexed the territory to open a land route to Burma, also encouraged them to remain settled in these areas for similar reasons.

Kukis are basically migrating tribesmen who came from the Chin Hills in Myanmar in the 18th century. There were two waves of Kuki migrants. Hence historians have classed them into two categories: 'old Kukis' and the 'new Kukis'. Compared to the Kukis the different Naga tribes migrated to their present habitat well before the 12th century. (Ahmos-Tai people who ruled over Assam in the 12th century mention Naga hill tribes in their chronicles.)

A chronology of events from the late 19th century onwards is crucial to understanding the causes of the present problem. The Manipuri Metei kings convinced the Kukis to settle in the land area which the Tangkhul Nagas claimed to be theirs. Relations were not exactly amicable between the Kukis and the Tangkhul and also other Naga tribes around whose villages some Kukis settled. A number of Kukis were employed in the Manipur army, and together with other army men they had wreaked havoc against the Nagas by burning several of their villages and pushing them back into the hills. At that time the Kukis had superior weapons to fight with and thus could suppress the Tangkhuls and other Nagas and force them to keep a low profile.

In the 1940s, the Naga National Council (NNC) was formed which included the Kukis in their demand for a separate homeland for Nagas as their main objective. The Nagas themselves were a congregation of more than 20 different tribes. After three decades of turbulence due to armed insurgency and the formation of Nagaland as a separate state, the NNC faced dissension in its cadre after the Shillong Accord of 1975. This resulted in the formation of the militant secessionist organisation, the National Socialist Council of Nagaland (NSCN) in 1980. The NSCN imposed a land tax on the Kuki settlements in Manipur, and it also declared that Kukis would not be included in the list of ethnic groups that would be part of an independent Nagaland. As a consequence, the Kukis retaliated by openly declaring their different racial descent and expressed aspirations for an independent Kuki homeland by forming the Kuki National Organisation (KNO).

In 1988 the NSCN cadres split into two groups: one led by Isak Chishi and T Muivah (NSCN-M) of the Sema and Tangkhul Naga group and the other by S S Khaplang (NSCN-K), a Konyak Naga from Myanmar. The split in the NSCN was taken as an indication of the weakening of the Naga militant organisation. This triggered off the emergence of the armed wing of the KNO, the Kuki National Army (KNA). The Kukis had always resented the tax levied on them by the NSCN and the formation of KNA emboldened the Kukis, especially those settled in Chandel district of Manipur bordering Myanmar, to refuse payment of the tax. This, predictably, angered the NSCN-M faction which had considered the levying of taxes as its right as Kukis were still taken as the outsiders who had been settled on Naga land by Manipuri kings; Nagas were rightfully taking back what had been taken away from them.

In the light of these events, the Nagas claim that the Kukis emboldened by possession of arms and the backing of KNA attacked some Tangkhul Naga villages around the Kuki settlements in south-eastern Manipur. In response, the Tangkhuls retaliated by killing some Kukis. A vicious circle of violence was completed when the Kukis went a step further and attacked villages which belonged to other Naga tribes. Therefore, a conflict which should have remained limited to Kuki-Tangkhul clashes widened and became a Kuki-Naga tribes clash. This has had repercussions in Nagaland as well. Kukis who live in Nagaland have begun to fear for their lives; the killing of Hanshing, Commissioner for Taxes, Nagaland, is directly related to the strife in Manipur.

Interestingly, on the other hand, the Khaplang NSCN is trying to gain mileage out of this conflict by threatening that if the NSCN(M) does not stop killing Kukis, it will see to the expulsion of all Tangkhul Naga residents in Nagaland. This is not an off-hand declaration to obtain a larger support base in Nagaland, it is rooted in the resentment shown by those Naga villagers who are unnecessarily interrogated by the Indian Army following ambushes on its convoys by NSCN(M) cadres. The NSCN(M) active in Ukhrul district bordering Myanmar has always taken advantage of the Indian Army's movement in southern Nagaland from Lozaphe to Jessami for which they have to pass through the narrow tract which falls in Manipur.

The ethnic clashes in the north-eastern hill region are not new. Two years ago Tobu village of Mon district of Nagaland witnessed gruesome clashes between the Konyak and the Chang Nagas, two tribes who occupy different sections of the village. The clash was directly related to a dispute over the ownership of land along the Taithong nallah. In fact, in April 1987 the then district commissioner of Mon had witnessed an oath-taking ceremony between the Changs and the Konyaks of Tobu. Since tribal customary law prevails in Nagaland, most intra-village, inter-village and inter-tribe disputes are settled through it. Oath taken in the name of heaven and earth is still considered to be the last (and most respected) resort in a dispute, in which the defaulter is supposed to perish for taking a false oath.

It so happened that a few men died from both sides and the two tribesmen ended up blaming each other for taking a false oath. The subsequent clashes, including the burning of villages, resulted in severe casualties on both sides.

To understand the deeper causes of these ethnic clashes, we need to go into the history of the north-eastern hill area. We have to remember that it was only the British who could annex some parts of Nagaland and Manipur—that also after a number of failed expeditions and casualties. The various Naga hill tribes—Angami, Ao, Lotha, Sema, Konyak, Tangkhul, Maram, etc—were independent before the British political agents came to the area. To comprehend the current scenario in Nagaland and Manipur, it is imperative to take a look at the social organisation of these hill tribes. Each tribe speaks a different dialect of the Tibeto-Burman language and there are more than 20 Naga tribes! The traditional political

organisation of these tribes ranged from autocratic rule of a chief to a very democratic set-up. No single tribe was united to be able to form a single large entity. Village or, to be more precise, a segment of a village—'khel' (an Assamese term)—was occupied by a single clan and its sub-clan was the most viable and functional unit. (Historically, one finds that British political agents had witnessed intense rivalry between 'khels' of the same villages in the late 19th century.) It was only when the whole village was attacked by another rival village, that all the clan units or 'khels' got together to fight the enemy. Some powerful villages—those who had a good number of warriors—had a hegemony over the weaker villages, who ended up paying tributes to the former basically to safeguard their lives from the head-taking raids, which were a part of initiation rituals. (It must be mentioned that the heads of women and children who had cut their teeth were priced very high, as to get them one had to pierce through the various ranks of Naga warriors and come out risking one's own head in the process!)

These Naga communities saw a gradual change both in their political and social system once the British took over the administration. The modern education process which began with the American Baptist Missionaries in the late 19th century and the gradual conversion to Christianity brought the different communities together. Christianity has been instrumental in bringing villagers of the same tribe as well as different tribes together. This consolidation coupled with the formation of a Naga Club and later Naga National Council (NNC) resulted in the demand for an independent entity once the British left India. But fissures emerged in 1954 and subsequent events over the last four decades have resulted in three separate organisations, NNC led by Khodao, a Lotha Naga, NSCN (Isak and Muivah) and NSCN (Khaplang).

Nevertheless, the various factions are united on one issue despite differences in basic strategy—to fight against the outsiders, the plains people. Behind this one still finds a fissiparous tendency; a strong allegiance for one's clan, village and tribe. Disputes regarding land ownership is the basic issue for contention between neighbouring villages. It is not uncommon to find district commissioners referring to arbitrations given almost 60 years ago by British officers on certain land disputes which have not yet been settled!

The complex relationship between clans, villages and tribes prevents any individual from taking action against his fellow tribesmen as well as those belonging to other tribes. The introduction of new political processes has on one hand given an impetus to political unification of various Naga tribes but on the other hand has also created fissiparous tendencies, dividing people along party lines, with each party adhering to different aims with regard to the political locus standi of Nagaland. It is common knowledge in Nagaland that each political persona is on the hit-list of one faction of NSCN and under the protection of the other; it is difficult for them to take action against either of the underground organisations. Therefore, although the secessionist ideology is voiced openly, the underground organisations are intrinsically involved in the democratic process, which makes one hopeful that a solution could yet be found to resolve the problem.

In addition to the historical and social reasons, an economic reason has recently emerged to escalate the violence in the region. More specifically, a fight to control the lucrative drug supply route from Myanmar has emerged as another cause of the ongoing conflict. There are diverse views on the role of the NSCN in the drug business. Many people in Nagaland claim that both factions of the NSCN regularly execute drug pushers in the area. On the other hand, the official view is that the NSCN(M) is striving to gain control over the land route in Moreh region of Manipur which is used for smuggling in narcotics, precious stones, Burma teak and various spices.

In a situation where land disputes, clan ties, tribal ties and above all a secessionist ideology prevail, can the state or central government solve the problem by the deployment of the armed forces?

Instead, what is actually needed in the north-east is the implementation of the development projects drawn up by the central and state governments which, at the moment, exist only on paper. There are enough educated youth in these states to work on these projects. In the absence of proper utilisation of both financial and human resources, rising unemployment will continue to provide a fertile ground for recruitment to the secessionist movement. In addition, the despair and frustration that arises from inadequate job opportunities will lead to increased drug addiction among the youth.

Operation Overlord: On the Eve

Frederic F Clairmont

In the boiling months preceding and following D-Day, 50 years ago, the thrust of the debate everywhere was the imperative of social transformation. The traumas of fascism and imperialism that reigned supreme before the war would vanish, preparing the earth for a greater share of decency, rectitude and probity.

JUST as the Lancaster bomber was approaching the English coast, after a photographic reconnaissance mission, between St Laurent and Arromanches, the Canadian navigator caught in his binoculars the apocalyptic sight of hundreds of slowly-moving landing craft and a staggering variety of naval ships, bobbing and weaving on the seas. "Oh Jesus", he hollered on the intercom to other crew members, "this is no Dieppe. This is the big thing. We're on the road at last." That specific moment was charged with unbridled emotion. The suspense of 'the big thing' was, in a certain way, delectably painful. No one knew the code-name 'Operation Overlord'; but what the binoculars revealed in the sinking light was that this tidal wave of steel would, in just a few hours, begin the pounding of Hitler's Festung Europa.

The grand climacteric had struck but the buckling of Nazi Germany was seen overwhelmingly as opening up vast new revolutionary vistas in which the old order deserved no place. Only the blind could not have seen the gathering storm. When 'the big thing' would come was no doubt a secret except to a handful, but for tens of thousands of airmen whose operations had been shifted from Germany to France over the last seven months, it was obvious that the day of reckoning for Adolf Hitler had come. It was now or never. It could not be postponed beyond June or July. In addition, the dazzling triumphs of the Soviet juggernaut, on a thousand kilometre front, was a reminder that with or without a Second Front Hitler's goose was cooked.

One understands in the perspective of 50 years the *cri de coeur* of president Richard Weisacker who commented on the 40th anniversary: "There is no such thing as guilt or innocence of an entire people. Guilt, like innocence, is not collective but individual. The predominant part of our present population was at that time either very young or indeed not born at all. They cannot acknowledge a personal guilt for acts which they simply did not commit." [Quoted in *The Guardian*, March 26, 1994.]

On the threshold of liberation in 1994, however, such philosophical meditations were simply irrelevant for millions of civilians and combatants in Britain, and doubtless beyond. Germans and Nazism were then seen to be inseparable. That burning hatred of fascism debauched, however, on something else: interminable heated discussions in the factories, in the pubs, the metro, the military messes, and all other social and private gatherings. After the crushing of Adolf Hitler what? A question with hundreds of corollaries; devastating social implications for the propertied classes and their entrenched political fellow-travellers.

In those boiling months preceding and following D-Day, the island kingdom had

been transformed not only into a mighty industrial and military colossus, but into a gigantic debating society, welded to every conceivable species of socio-political activism. The thrust of the debate was the imperative of social transformation. These highly charged political debates with their extensive organisational networks at all working class, institutional and social levels, flourished over the years as never before, or since. Hence they were anathema to the British ruling class and certainly to a true blue Tory such as Air Marshal Harris, but by the spring of 1944 suppression or deviation of the 'subversive' twist of these debates was simply impracticable. Tens of thousands of servicemen and civilians were classified as subversives or potential subversives by the Home Office, acting in concert with the security apparatus within the armed forces.

The unstoppable Red Armies, with all their ideological overtones, was a cause of official apprehension. An incipient but largely aborted anti-Sovietism merely fuelled the debate. Pro-Soviet sympathies were omnipresent,—given full expression even by those who could not be so easily branded as communist sympathisers or dupes. Joseph Stalin was invariably and deferentially referred to as Marshal Stalin, or more affectionately, as Uncle Joe. Writing 13 years after the war, Marshal Bernard Montgomery could say: "Consider Stalin. A great leader, ruthless maybe, and no kind of gentlemen; but if it had not been for him the Russians might well have left the war in 1942." (*The History of Warfare*, London, 1968.) A debatable proposition, to be sure, but one which nonetheless mirrored the sensibilities of an epoch.

One could never forget, or be allowed to forget, the heroic mobilising battle cry of Winston Churchill: "We shall not flag or fail. We shall go on to the end. We shall fight in France. We shall fight on the seas and on the oceans...we shall never surrender." Those were imperishable fighting words. But as the tide of victory turned after El Alamein and Stalingrad and political consciousness soared to fever pitch it appeared obvious to most that it could not be a Churchill and the decadent social class from which he emanated, and the Imperial order he defended so loquaciously, that could engender a radical reordering of the post-war world.

The war had brought together in a confined space tens of millions of peoples. True, a society of full employment based on a war economy was created overnight. The traumas of the inter-war years with its mass deprivation, economic crises, the upsurge of fascism were burnt into the minds and bodies of almost all; there were few who had escaped the terrors of those years of mass unemployment with no welfare systems to mitigate its savagery.

What imparted strikingly vibrant colours to these debates and organisational activism in a Britain that was still tenaciously provincial was the presence of several nationalities that shared common class aspirations and social animosities: the Free French, Canadians, Americans, Europeans of every assortment, thousands of colonial students and the tens of thousands of jobless Irish (despite their hatred of Imperial Britain) that migrated to the UK in quest of jobs, and who enlisted massively in the British armed forces. The war years were therefore not merely a place of collective encounters, but provided the arena for the igniting of radical politics. Enhancing this radicalisation was that the combatants of June 1944 were in many cases fighting alongside many that had seen the holocaust of 1914-1918. It was this unique symbiosis of the young and the older that had become a source of enormous cultural and political enrichment.

The appeal for a Second Front that mobilised hundreds of thousands since 1942 went way beyond the familiar appeal for helping "our brave Soviet ally that tore the guts out of the Nazi army", to use Churchill's homage. For Krishna Menon, who played a leading role in calling for the Second Front, it was a prelude to colonial independence. In this he was not alone.

This was true of the thousands of politicised colonial students concentrated in London and the Midlands. As the marchers gathered the chant went up: *Second Front: Now, Now, Now. Second Front: Now, Now, Now.* Civilians and military marched and chanted together. Slogans and banners of all radical political persuasions appeared, together with the omnipresent red flags. At the end of every demonstration there was the militant traditional political discourse. As Krishna Menon said many years later to me: "We believed sincerely in the cause of the Second Front, but as colonials we also knew that it provided us with a lever of immense power in the battle for independence." A fact that could not be dissimulated from the Colonial Office.

'The big thing' when it came seemed at first unreal. It was deliverance. It was the Messiah. Despite their youth, the aircrews were tired. The bombs and the V2 rockets had taken their toll. There was the reality of pervasive fatigue in the context of joy inexpressible. The rationing system may have been parsimonious; but it was equitable. The end was coming soon; and with it the hopes that the traumas of fascism and imperialism that reigned supreme before the war would vanish, preparing the earth for a greater share of decency, rectitude and probity.

Certainly the reality did not match the dream in the specific form that many combatants and non-combatants would have wished in the cruel years that followed victory. The dream never matches the reality. What was of the essence however was the destruction of fascism. That was worth fighting for. And that is the authentic meaning of the commemoration of the 50th anniversary.

Modernisation and Media Attraction

Anglo-Malaysian Relations

Vejai Balasubramaniam

The present fracas in Anglo-Malaysian relations is a product of Malaysia's assertive stance on international issues which spells the country's coming of age and the need for the political elite to contend with the demands of domestic politics.

FORMER colonies, especially those which have retained many of the colonial structures, have always tended to be viewed by the ex-colonial condescendingly. Hence they have generally refrained from really asserting their independence *vis-a-vis* the latter.

Modernisation, especially of the economic sector, on the other hand, however, has helped enhance confidence among the political elite and also attracted the attention of the international media to Malaysia. The present fracas in Anglo-Malaysian relations is a product of Malaysia's assertative stance on international issues, thus asserting the country's coming of age, and the need for the political elite to contend with the exigencies of domestic politics.

In the early years of Malaysia formation security was the main concern of the political leaders. Internally the Malayan Communist Party had gone underground, after failing to win the war for the 'hearts and minds' of Malaysians, engaging government forces in a guerilla war. Externally the country faced the Indonesian intention on smashing Malaysia, which it saw as a neo-colony meant at encircling it, and a south-east Asia which was politically unsettled.

At this early stage the Malaysian political elite, who inherited many aspects of the colonial economy and forms of governance, worked very closely with Britain and her allies: the US, and closer home Australia and New Zealand.

Politico-security and economic considerations limited the ability of the political leaders to assert the country's independence. Hence it was inevitable the country came to strongly align herself with the west during the cold war. Accordingly reports on Malaysia in the western media were generally favourable.

However such concentration on the politico-security and economic imperative

by the political elite saw measures to rectify the socio-economic mainly fulfilling, principally, a security function. By not privileging the socio-economy the colonial constructed economic imbalances continued to persist, to the detriment of ethnic relations in the country. It has been argued that this is one of the reasons for the ethnic clashes of 1969.

With the inception of the New Economic Policy (NEP) the government began to direct its attention to modernising society, from the early 70s. The two-fold themes inherent to the modernisation process, that is economic and political development, saw the government directing its resources towards enhancing the country's productive base and creating a culturally homogeneous polity. In this period domestic issues were the main concern of the political leaders.

The modernisation imperative saw the federal government focusing attention on greater centralisation and co-ordination of policy and decision-making. Rather than looking out the federal political elite was more concerned with the 'negeris' (the provincial states): for Malaysia to develop as quickly as possible maximum co-operation from negeri leaders was needed.

In this domestic oriented stage the political elite found it expedient to continue to align with the west. Thus such reports of Malaysia in the western media continued to be favourable. Hence the country's labour laws, forest industry, environment policies, or relations with indigenous peoples, corruption, freedom of press, etc, issues which today are bandied about were hardly ever the subject of the mainstream British media or its politicians in the 60s and 70s.

Ten years on, the conscious attempt to modernise society saw Malaysia by the early 80s fast shedding its image as a producer of primary commodities. Economically the country was on the threshold of the manufacturing stage. Similarly a polity schooled in the Malay language occupying executive and managerial positions in the public and private sectors had entered the middle class and expanded its ranks. However, this notwithstanding society continued to be plagued by ethnic based concerns. Among other things this saw the government coming to pitch the nation's stability on economic growth.

To realise economic growth the ruling elite were of the view that the economy had to make the strategic shift to the industrial stage, and the role of the manufacturing sector expanded. It was in attempting to make this strategic shift that its architect prime minister Mahatir Mohammed provoked controversy with Britain.

To be sure the importance of Britain and to a certain extent the west as a whole, as economic models to be emulated had declined by the 1980s. Their poor economy, and restive labour relations, were looked upon with disdain by . the Malaysian political elite. Japan's remarkable recovery after the second world war, disciplined workforce and work ethic, on the other hand came to be looked on as the ideal model.

Making Japan the model to emulated led to the introduction of the 'Look East' and 'Buy British Last' policies in the early 1980s. These policies which in the main were aimed at reorienting the minds of Malaysians towards the need and virtues of discipline and a paternalistic government however came to be viewed by the British government in particular as anti-British and anti-west—though ironically Japan too was a part of the west—and an indicator of Malaysia's attempt to re-orient her foreign policy.

The failure of the Thatcher government in Britain to understand the scope of the shift towards Japan thus led to a strain in relations with the Mahatir government in Malaysia. The latter was perceived as a dictator and anti-west; and among the Anglophile as someone who had an inferiority complex for not having been educated in Britain, like the prime ministers who preceded him. Naturally such sentiments found their way to the media and exacerbated what was no more than an attempt at social engineering by the Malaysian prime minister.

Such strains in relations arising from misconceptions on the part of the British were soon resolved when following the onslaught of the recession which hit the Malaysian economy in the mid-80s saw members of the Malaysian government jaunting on an investment promotion drive overseas; to be sure Britain was included in their itinerary.

The special concessions, for example tax holidays, repatriation of profits granted to foreign corporations which entered into joint ventures with Malaysian enterprises principally in the manufacturing sector, led to a torrent of foreign capital into the country. By the end of the second half of the 80s the economy had begun to pick up and the country was recording an average of 8 per cent growth from 1989 onwards.

Insofar as this satisfied the economic aspect of the modernisation equation it also provided the structural pre-conditions which enabled the political elite to assert the country's position internationally. By emphasising the role of the manufacturing sector as the engine of growth and foreign exchange earner the country's economic base was diversified. Malaysia had by the early 90s shed its image as a primary commodity producer.

The modernising economy too heightened the confidence of the ruling political elite, imbuing them with the view that Asians too can manage their economies soundly, if not better than the west. To be sure the west, in particular Britain, the US, and Australia, were going through a recession, while the Malaysian economy and Asian economies as a whole were experiencing strong growth. Providing substance to the political elite in the former that success was due to their own and their people's hard work and resilience; and that it was quite independent of the west.

Among others this saw the Malaysian political elite taking a more aggressive stance in international forums, for example: the Commonwealth, Asean, south-south conferences, the OIC, the G15, the non-aligned movement, the UN—a position which culminated in the conceptualisation of the East Asian Economic Caucus (EAEC).

In most of these forums it was the west, in particular its double standards on issues of human rights and democracy which drew the brunt of criticisms from the country's political elite, helping to raise Malaysia's profile, in particular that of Mahatir Mohammed's, internally and among south countries (especially those who for economic reasons had to contain their criticisms). But while modernisation allowed the political elite to take a more assertative stance internationally it also attracted the media to Malaysia.

The reviews and comments on Malaysia in the international media were mixed. Thus while reviews which tended to focus on economic aspects generally tended to be favourable while those which dwelt on politics, culture, and society were generally mixed. The allegations of corruption by Malaysian ministers while an orientalist construct of the north that most business dealings with the south are surreptitious is also a reaction, albeit condescendingly, of sections of the north to Malaysia's assertative stance.

While the validity or otherwise of these accusations is important for the government's credibility the ruling elite's tendency to laud good reviews and reject those which are critical reflects its need to use the media to its own advantage; that is the exigencies of domestic politics. Herein lies the reason why rather than regard the accusations of corruption as stemming principally from greater international media interest in the country's modernisation *The Sunday Times* report had culminated in the present Anglo-Malaysian fracas. As far Mahatir Mohammed is concerned the 'die is cast', there would be no more government contracts awarded to British firms.

The aid granted by the British government under its Overseas Development Aid programme for the Pergau Dam project despite the findings of surveys on its economic logic does raise some interesting questions. Many researchers on aid from countries of the north to the south have pointed out how such aid benefits capitalist interests in the north. But the exigencies of domestic politics does not seem too concerned with exposing such interconnections, or otherwise, between aid and trade. Hence it does appear an excellent opportunity of exposing the surreptitious nature of business dealings in the north seems to have been forgone. Whether Malaysia would want to take the lead in this direction, however, remains to be seen.

May 1994

REVIEW OF INDUSTRY AND MANAGEMENT

Changing Role of Small-Scale Industry

International Influences, Country Experiences and Lessons for India

S Nanjundan

This paper discusses the changing role of small-scale industry in the context of the adjustments called for by the process of globalisation. The first part of the paper reviews the internationally pervasive influences of globalisation, technology revolution and structural reforms. The second part presents eight country case studies of the changing role of small-scale industry. The final part attempts to draw lessons for India from the analyses of the first two parts.

THE oil crisis of the second half of the 70s stimulated profound changes in both developed and developing countries.

In the developed countries a process of restructuring of economies has been taking place based on optimising factor use (energy, materials, capital and labour), reducing costs and improving productivity and efficiency, thereby leading to growth and higher incomes in the 80s and 90s. The technological revolution engendered by the microchip and by rapid telecommunications has aided the restructuring process by underlining the advantages of flexible manufacturing methods over mass production. Moreover, globalisation of financial markets and internationalisation of manufacturing—assisted by computer-integrated but decentralised management technology—have enhanced the importance of the services sectors *vis-a-vis* manufacturing in these countries

In the developing countries (except for the NICs), on the other hand, the oil crisis, among other factors, led to a cumulative chain of balance of payment crises, production crises, reduced productivity, lower incomes and enhanced poverty, at least until the beginning of the 90s. Structural adjustment programmes, assisted by the IMF and the World Bank, have sought improvements through appropriate macro-economic, fiscal, trade, industrial and agricultural policies, oriented to the market mechanism, the private sector and the entrepreneur.

Most sectors of the economies of developing countries have had to drastically adjust to the process of globalisation moving from a state of temporary and involuntary dependence on the more powerful to one of voluntary interdependence. This paper will concentrate on the changing role of small-scale industry in this process of restructuring. The first part of the paper will review the internationally pervasive influences of globalisation, the technology revolution and structural reforms. The second part will present country case studies of the changing role of small-scale industry in eight countries: the US, Germany, Italy, Japan, China, Korea (South), Malaysia and Mexico. The final part will attempt to draw lessons for India from the analyses of the first two parts.

I Internationally Pervasive Influences

Globalisation

The technological, management and information revolution of the 1980s has given overriding importance to knowledge- and information-based manufacturing, marketing, servicing over capital-, material- and labour-intensive operations. Typically the cost of manufacturing is only 25 per cent of the end-user price. Value is added not by labour alone but more by research and development (R and D), engineering, financing and marketing functions. "Such functions as distribution, warehousing, financing, retail marketing, systems integration and services are all legitimate parts of the business system and can create as many and often more jobs than simply manufacturing operations."[1]

Computerisation and the spread of information technology have not only blurred the distinction between manufacturing and services sectors but also increased the share of the latter in GDP in developed economies. Over the last 20 years, manufacturing share in GDP has decreased from 36 per cent to 29 per cent in Japan, from 28 per cent to 20 per cent in the United Kingdom, and from 26 per cent to 19 per cent in the US. "Manufacturing is important for employment, trade, and the creation of wealth. But it is not uniquely important ... nor ... necessarily the most important activity in a rich modern economy... Understanding why manufacturing is no longer all-important begins with the fact that more and more of the output of wealth creators goes into intangible things: computer programmes, telecommunication systems, films, etc."[2]

The globalisation of the world economy has been going apace, megafirms interlinking each other in the US, Japan, Europe, Latin American and the Asia-Pacific region. Interlinking and co-operation are particularly close among the US, Japan and the European Union (EU). "The liberalisation of finance has encouraged the growth of some 600 megafirms which used to be called multinationals and which now account for about one-fifth of value added in agriculture and industrial production in the world... Megafirms are essentially non-national."[3] The globalisation of the world economy has tended to reduce the sovereign power of governments. "Real power is devolving on decentralised groups and subgroups of workers, entrepreneurs and managers linked around the world—the groups of problem-solvers, problem-identifiers and strategic brokers."[4]

Among the global developments, the growth of regional trade blocks must be mentioned, whose members gain economies of scale by trading preferentially among each other in a larger market. The EU and the evolving North American Free Trade Area (NAFTA)—US, Canada and Mexico and Asia-Pacific Economic Community (APEC) are prominent examples. Africa and Latin America have their regional and subregional groupings, but trade is still largely with developed countries. The South Asian SAARC is as yet still-born as far as trade and economic co-operation go.

The effects of globalisation and regionalisation on industrialisation and small industry development emanate from the opening up of the economy and enhancement of such competitive advantages as exist in human and natural resources and their development hitherto. It will be noted in the next section that the advantages of the technological revolution have been mostly to enhance the competitiveness of developed countries through flexible specialisation and computer networking. Liberalisation of trade and freer movement of factors of production as well as networking of decentralised work-units have increased the role of strategic analytic core management and of services, especially financial. At the same time NICs and China have benefited through their infrastructure and skilled manpower in being able to attract industries from developed countries to locations in their countries in well-developed industrial and technology parks. Poorer developing countries have attracted polluting industries such as leather or those using cheap and exploited labour such as in carpets and garments.

Technology Revolution

Scientific progress as well as economic efficiency have come to depend on the broad diffusion of micro-processors. This has

brought about a technological revolution and affected manufacturing methods and enterprise organisation in developed countries in a significant way which tends to favour small-scale production. This technological revolution—popularly known as FS or flexible manufacturing system—will perhaps be the most important development affecting industrialisation and small-scale industry development in developing countries in the coming one or two decades. It provides both challenges and opportunities to developing countries which cannot afford not to adapt their production and management system to the FS paradigm.

The small industry development wave of the 1960s—led by India—was inspired by the lessons of the pre-world war II great depression and the remedies adopted in the western world, particularly the UK and the US. The triad of industrial estates, financing and industrial extension services owe much to the industrial estates programme in the UK and the Small Business Administration programme (preferential government purchases, sub-contracting and subsidised loans to small businesses) in the US.

The second wave in small industry strategies and programmes which must now take place in developing countries—sooner rather than later—will hopefully be inspired by the FS paradigm resulting from recent experiences in Europe (mainly Italy and Germany) which has championed the viability of small-scale industrialisation. It is to be noted that the essential elements of FS include inter-firm co-operation in agglomerations or clusters of related manufacturing in industrial districts, combining competition and co-operation, relationship between small and large enterprises, networking and 'collective efficiency'. Such ideas were a feature of 'functional', 'specialised' and 'ancillary' industrial estates advocated and promoted in India in the late 1950s and 1960s, with only limited success (perhaps because of the closed stifling macro-policy environment). The employment of micro-computers (as a network) with centralised co-ordination and management and fast, flexible, high quality, diversified and low-cost production resulting therefrom seems to have made all the difference to the success of flexible manufacturing programmes in Europe.

To cite the example of Italy,[5] geographic specialisation in various productive sectors through small and medium enterprises has taken place in hundreds of small towns and villages, especially in the north-east and the centre. These enterprises are set up in industrial districts characterised by single-sector production. Examples are metal products, machine tools, musical instruments, textiles and clothing, footwear, leather goods, furniture, jewellery, glassware, ceramic tiles. They are generally highly competitive and of high quality and precision, contributing to enhancing Italian exports. Prato produces 38 per cent of internationally-traded carded wool, representing a quarter of the earnings of the Italian textile industry. Sassuolo meets one-third of the world market for ceramic tiles; Como is famous for high quality pure silk fabrics

It should be noted that these examples are in traditional industries, till recently regarded as labour-intensive and where international comparative advantage lay with developing countries.

One could take other examples from the US[6] where almost complete automation has enabled production of certain products to be shifted back to the US from the developing countries. (Clusters or agglomerations providing collective efficiency through interrelations of small-scale industries do not apply in the cases cited below, but automation and flexible manufacturing are critical.) Tandy shifted production of speaker enclosures from the Caribbean to Texas and exported them to Japan. Arrow shifted 20 per cent of shirt production back to the US after 15 years of out-sourcing. Computerisation enables quick response to changing styles in smaller lots production (batch production) as against the earlier mass production (MP). Asian suppliers require three months to fulfil new orders. Benetton of Italy requires two-to-three months and Hagger Apparel in Dallas three days (as against 7 weeks it once needed) because of its electronic network.

The Italian industrial districts are somewhat different than individual firms in the US in that they comprise of clusters of small firms. The similarity is in being able to respond quickly to changes in market demand and competition through flexibility in manufacturing products and processes.

Technology blending has also contributed to technology innovation. Prato, the textile centre, has a constellation of 15,000 small-scale firms in manufacturing, finishing, dyeing, etc, as well as transport, insurance, banking and other services. 70,000 people are employed, traditional technologies co-exist with the most modern. It is a decentralised production system exhibiting a high degree of flexible integration, especially in the distribution of orders and marketing. The Italian National Agency for Nuclear and Alternative Energy (ENEA) assisted the Prato district in formulating and implementing an energy efficiency system, a computer-aided design (CAD) system for design, robotised system for spinning and carding, automatic looms, and other innovations, diffusing computer and telecommunication systems. Institutional and organisational improvements were made through an association of all those involved (Sistema Prato Innovazione Tecnologica (SPRINT)) for providing leadership and financial backing. Over a period it has been possible to raise productivity and quality and enable fast response to changes in market demand.

The contrasting features of mass production (MP) and flexible specialisation (FS) have been described below.

Ajit Bhalla and Jeffrey James review the alternative economic and institutional mech-

TABLE 1: MASS PRODUCTION AND FLEXIBLE SPECIALISATION—CONTRASTING FEATURES

Mode of Production	Competition	Product Strategy	Attitude to Labour	Division of Labour	Embodied Technology	Factory Layout	Inter-firm Links
MP	Price	Standardisation	Seen as a cost	Single-tasking, single-skilling, hierarchical communication, quality control, specialised	Special purpose, fixed transfer line	Functional	Short-term
FS	Product characteristics	Variety; rapid response; Innovation	Seen as a resource	Multi-tasking, multi-skilling, two-way communication, trust; involvement in technical change, quality at source, labour as a resource	General purpose, flexible transfer line	Cellular	Close co-operation; long-term

Source: R Kaplinsky, *From Mass Production to Flexible Specialisation A Case Study from a Semi-Industrialised Economy*, Institute of Development Studies, Sussex, November 1991.

anism implicit in the application of new technologies for institutional mechanism implicit in the application of new technologies for small-scale industrialisation through three possible routes:

(1) Choice of technology;
(2) FS; and
(3) Decentralisation.

Their analysis in tabular form is reproduced (Table 2) and is self-explanatory.

There has as yet been insufficient research experience in the spread of new technologies or conditions under which FS could be beneficially promoted in developing countries. Computerisation and CAD/CAM applications have fairly spread in NICs. There seem to be good prospects for the spread of micro-computer technologies in developing countries. However, the complementary telecommunication facilities need to be more fully and rapidly established in countries such as India. Indigenous R and D facilities also need to be strengthened and further developed. New wave technologies in electronics, computer, telecommunications, biotechnologies, etc, have to develop rapidly.

The new technologies emphasise external economies of scale and scope which is provided by networking of production. This is possible with small- and medium-sized enterprises and does not necessarily require very large size of individual operations.

The organisation of production in clusters or agglomerations, technical and managerial co-ordination and networking through computers may need an appropriate social and cultural milieu where group dynamics in socio-economic cultural activities (through families, extended families, clans, tribes, etc) is more significant than separate individual activities.

The new technologies of FS lend importance to meso-factors (as contrasted to macro- and micro-factors). The development of clusters and agglomerations of enterprises in regional towns to meet regional/local consumer demands are considered significant and provide potential for small industry growth. The development of town and village enterprises in small and medium towns in China during the 1980s led to considerable industrial growth. In regional development, small enterprises operate in niches, serve small specialised or local markets, exploit local/regional labour and resources and make often specialised and non-standardised products, thus offering opportunities for FS.

Hubert Schmitz,[7] one of the pioneers in the field of research on small firms and FS, has cited the example of Kumasi in Ghana where the small-firm economy has exhibited a remarkable ability to respond quickly to crisis situations as well as innovations and collective efficiency. Schmitz' conclusions from studies in several African, Asian and Latin American countries are the following:

(1) Competitiveness requires the capacity to adapt to disruptive circumstances in developing countries even more than in developed countries;

(2) Sectoral agglomerations of small firms are conducive to development of such capacity due to their potential for collective efficiency and flexibility;

(3) However, fast adaptation and innovation do not necessarily take place in clusters; and

(4) How to foster collective efficiency through public policy is still an open question.

Structural Reforms

Some 35 African countries have been implementing (or are about to implement) structural adjustment programmes under arrangements with IMF. For some 24 countries credits and loans amounted to US $ 7.5 billion. "The common feature of the programmes is their focus on laying the foundation for sustainable development; by their emphasis on reducing financial imbalances, removing structural impediments from private economic initiative, providing a supportive infrastructure, and creating efficient and effective institutions, while making every effort to shelter the poor and the vulnerable."[8]

Structural adjustment programmes in mostly African countries (but also a few other developing countries, including recently India) have been necessitated by a long-term trend (20 years in many African countries) of continuous deterioration of per capita income, growing external indebtedness, fiscal imbalances and decreasing outputs in agriculture and manufacturing. No doubt, in several cases natural calamities and civil/military disturbances have been the main reasons. Basically, past development policies of command economy-type—planning, controls, public sector dominance—have contributed significantly to the malaise in many cases.

Industrialisation policies in many of the affected countries had relied on low agricultural prices and diversion of resources to grandiose public sector projects of import-substitution, raw material processing or basic industry development nature which made considerable losses and added to fiscal and balance of payments deficits of the countries. As regards small-scale industry, supply-side measures of assistance provided

Table 2: New Technologies and Small-Scale Industrialisation—Alternative Economic and Institutional Mechanisms

	Choice of Technology	Flexible Specialisation	Decentralisation
Technological focus	New technology as an expansion of the existing range of techniques	New technology as part of the new FS paradigms	New technology as an expansion of spatial technological possibilities
Unit of analysis	Individual firm	Individual firm as part of a well-defined cluster of firms	Individual firm/community
Organisational change	Not major area	Innovative complementarities	May involve changed relationships between central and dispersed units of production (distribution)
Geographical focus	None	Agglomerative clusters	Dispersion
Inter- and intra-firm linkages	Only insofar as differential rates adoption by small and large firms affect the competitive position of the former	Central issue, competitive and co-operative relationships between small-scale and large- and small-scale firms	Unimportant (with dispersed 'stand-alone' adoption) or important (where dispersed units interact with centrally-located units)
Benefits	Increased profits by individual adopting firms	'Collective efficiency', dynamic gains in export markets, externalities	Regional decentralisation, increased equality
Main constraints	Factor prices, skills, information	Problems of collective action, 'government failures' to induce co-operative behaviour	Lack of infrastructure and effective demand in dispersed locations
Examples	CAD/computer-aided manufacturing (CAM) in newly industrialising countries (NICs); micro-computer technologies in Africa	Prato	Benetton, micro-hydro

Source: Ajit Bhalla and Jeffrey James, *Micro-Electronics, Flexible Specialisation and Small-Scale Industrialisation in the Third World*, World Employment Programme, International Labour Organisation (ILO), 1991.

by centralised government [illegible] failed to catalyse entrepreneurship and to lead to the establishment of viable enterprises Such measures in the form of accommodation in industrial estates, financing, raw material supply, import facilities for equipment and raw materials, training and common facilities were costly and benefited only a select few The majority of existing and potential small enterprises was discriminated against—compared to larger businesses, private and public—and had to pay more for imports, credit and other services, thus rendering their enterprises unviable and unprofitable

Broadly speaking, structural reforms have consisted of external sector reforms (correcting the over-valuation of domestic currency/under-valuation of convertible currency), enhancing availability and liberalising allocations of foreign exchange, demand management (restructuring of demand within the economy away from consumption towards the productive sectors), liberalisation of internal trade and agricultural marketing and processing, and public sector restructuring (removal of protection, adjustment of tariffs, reduction of subsidies, privatisation, reform of civil service, etc)

A recent study[9] categorises the characteristics favoured or penalised by structural reforms in African countries as shown in Table 3 According to the author of the study, the findings suggest that structural reforms favour modern innovative small firms, especially the engineering sub-sector, and penalise traditional micro-enterprise activity On the other hand, another study (United Republic of Tanzania)[10] indicates that the beneficiaries of structural reforms have been mostly micro-enterprises using mainly domestic resources Informal micro-enterprises in the United Republic of Tanzania grew rapidly during 1985-1990, in many cases doubling the employment of labour over the period There has been a boom in forward-linkage industries, e g, grain mills, oil presses, coffee/cashewnut processing and saw mills Developments in other countries, e g, Zambia, Uganda, Senegal and Ghana also confirm the vitality of micro-and informal enterprises One reason is that many of them compelled by the difficult circumstances of the mid-1970s to the mid-1980s learnt to be innovative and make use of domestic resources ('learning by doing') The provision of incentives to these enterprises has had multiplier effects to some extent

The effects of the reforms may be further elaborated on the basis of the studies already cited

(1) External sector reforms Micro-enterprises which have failed to significantly increase the quality of the products, e g, textiles, soap, footwear have lost markets to imported goods. Those which have upgraded technology and found product niches have benefited from the availability of imported components and diversified their production.

(2) Demand management: Small firms catering for the poorer sections of the population or the public sector have suffered. Small firms which have been able to develop linkages with growth sectors and improve technology and quality have benefited, e g, small engineering workshops, tool-makers, machine-tool manufacturers and repairers

(3) Internal trade/agriculture liberalisation Encouragement to forward-linkage industries, e g, agro-processing

(4) Public sector restructuring Opportunities for subcontracting open up, on the other hand, skilled workers, managers and entrepreneurs—retrenched from the public sector—crowd into the small-scale sector

According to IMF, the growth rate of countries under structural reform programmes has been 4 2 per cent per annum in the three or four years following the reforms as against 2 6 per cent in the preceding three-year period[11] Moreover, export performance—particularly non-traditional exports—improved significantly

One important lesson to be learnt from the experience of structural reforms is the relevance of selective targeting of assistance to small-scale enterprises based on needs and potentialities rather than generalised supply-side assistance

II
Country Case Studies

Over the last two decades there has been a considerable impact of global developments on the growth of the industrial sector, particularly the small- and medium-scale industry sector Globalisation of manufacturing, trade and finance and development of new technologies economising on factor use and accenting on knowledge, skills and information have turned the comparative advantage even in traditional industries in favour of the developed countries Many of them have moved from mass production to flexible manufacturing methods through the use of information technology (micro-computers and telecommunication channels) This has enabled flexible responses to changes in market demand which has been characterised by differentiated products rather than standardised products. In this process, the role of small- and medium-scale enterprises has somewhat enhanced in the developed countries The developing countries on the other hand have—except for newly industrialising countries (NICs)—suffered a deterioration in their economic growth There has been a cumulative chain of balance of payments crisis, production crisis and fiscal crisis Structural adjustment programmes assisted by the World Bank/International Monetary Fund (IMF) have been designed to remedy this situation Macro-policies of liberalisation and tighter monetary and fiscal regions on the whole adversely affected in the short term the profitability of existing industries However, experience indicates that realistic pricing, availability of imports and introduction of competition have in the medium term benefited the most dynamic of the industrial enterprises which could link up with the growth sectors and could undertake export efforts The response of the small-scale sector and particularly the informal sector in some countries has been very encouraging They often filled the gap created by the decline of large enterprises In some countries, they have organised themselves into self-help groups, association, etc, to obtain the advantages of co-operation in marketing, financing, supply of raw materials, etc Such co-operation has thus stimulated the growth of non-governmental organisations (NGOs) to assist in the development of small scale industries

United States

US remains the biggest single industrial power and the world leader in technology Its essential features are globalisation of manufacturing increasing role of services, electronic computer-telecommunication revolution

Table 3 Enterprise Characteristics Favoured or Penalised by Structural Adjustment Policies

Characteristics Favoured	Characteristics Penalised
Low import dependence	High import dependence
High linkages with growth sectors of the economy	Low linkages (local demand)
Significant technological enhancement	Low technological enhancement
High barriers to entry	Low barriers to entry
Innovation	Cut throat competition
Serving an import substituting function	

Table 4 Definitions of Small Business in US Labour Legislation and Administrative Practice

	Small Business Administrative Loan Programme
Manufacturing	500 1 500 employees (depending on industry)
Wholesaling	500 employees
Services	$ 3 5 - 14 5 million annual sales or receipts (depending on industry
Retailing	- do-
Construction	$ 17 million average annual receipts for three past years
Agriculture	$ 0 1 - 3 5 million annual receipts

Source SBA, *Business Loans from the SBA*, September 1984

and global influence of its mega firms. This new system of accelerative hi-tech wealth creation has been described by Toffler as characterised by the following elements.

—The new accelerated system for wealth creation is increasingly dependent on the exchange of data, information and knowledge. It is 'super-symbolic'.

—The new system goes beyond mass production to flexible, customised, or, 'demassified' production. Because of the new information technologies, it is able to turn out short runs of highly varied, even customised product at costs approaching those of mass production.

—Conventional factors of production—land, labour, raw materials, and capital—become less important as symbolic knowledge is substituted for them.

—Instead of metal or paper money, electronic information becomes the true medium of exchange. Capital becomes extremely fluid, so that huge pools of it can be assembled and dispersed overnight.

—Goods and services are modularised and configured into systems, which require a multiplication and constant revision of standards.

—Slow-moving bureaucracies are replaced by small (demassified) work units, temporary or 'ad-hocratic' teams, increasingly complex business alliances and consortia. The bureaucratic organisation of knowledge is replaced by free-flow information systems.

—The number and variety of organisational units multiply. The more such units, the more transactions among them, and the more information must be generated and communicated.

—Workers become less and less interchangeable. Industrial workers owned few of the tools of production. Today the most powerful wealth-amplifying tools are the symbols inside workers' heads. Workers, therefore, own a critical, often irreplaceable, share of the 'means of production'.

—The new hero is no longer a blue-collar worker, a financier, or a manager, but the innovator who combines imaginative knowledge with action.

—Wealth creation is increasingly recognised to be a circular process, with wastes recycled into inputs for the next cycle of production, necessitating computerised monitoring and a depth of scientific and environmental knowledge.

—Producer and consumer, divorced by the industrial revolution, are reunited in the cycle of wealth creation, with the customer contributing not just money but market and design information vital for the production process.

—The new wealth creation system is both local and global. Powerful microtechnologies make it possible to do locally what previously could be done economically on a national scale. Simultaneously, many functions spill over national boundaries and fuse into a single productive effort.

The characteristics described above have tended to accentuate, on the one hand, the role of innovative small scale work centres in the economy, and, on the other hand, to underline the importance of inter-linkages, both horizontal and vertical, amongst firms of different sizes and between different locations inter-regionally and internationally. While small business is an integral part of the economic system, it is not regarded as a distinct category in the actual organisation of the US, politically, economically or socially. This is true despite the operations of the Small Business Administration created in 1953 to provide low interest loans, technical assistance and help in tendering to government contracts, to defined categories of small enterprises. A small business is defined broadly as one which is independently owned and is not dominant in its field. A more detailed definition is given in Table 4.

Small enterprises are important in the US as a seed-bed for growth, initiator of ideas and innovations, a countervailing force against cartels, and as a means to ensure 'fair trade' practices. The vitality and net growth of small business is due not mainly to small business policy, but to the key role in the polity of individual initiatives and entrepreneurship, the infrastructural facilities provided by state and local governments, the activities of area-based corporations and associations, trade union activities, etc. The major impact of SBA programmes has tended in recent years to be on the promotion of business by minorities (e g, blacks, hispanics) and by women.

In the US economy only a quarter of total employment is provided by manufacturing. In the size category less than 100, only 14.7 per cent of employment is by the manufacturing sector; in the category less than 500, it is about 18 per cent. Construction, trade and services sectors are far more significant for small business employment. Employment in small business dominated sectors increased from 48.6 million to 50.1 million between 1988 and 1989 but this was almost entirely accounted for by the trade and services sector. There was little change in manufacturing, which means there has been a shift in employment away from manufacturing. However, within the manufacturing sector there has been a slight shift towards smaller sized establishments due to deconcentration and decentralisation. In 1986 establishments employing 500 or more workers accounted for 65 per cent of the total employment in manufacturing, although they constitute only 15 per cent of the total number of manufacturing establishments.

Micro-studies in the US lead to the conclusion that net new job creation has been in small enterprises, which account for the bulk of employment growth. The reasons are: (a) the move towards flexible specialisation (away from mass manufacturing), (b) decentralisation of activities by large companies, (c) small optimum sizes for new products, (d) deregulation of economic activities, and (e) managerial techniques favouring small business.

Changes in American business have been perceived as responses to competitive pressures emanating from external environment. Flexibility to adjust quickly to the shifting business environment is facilitated by cross-training workers to operate on several products. Cost reductions have taken place through lower wages and reduced profit margins for subcontractors and vendors. The specific changes include: (a) a reduction in the number of subcontractors, (b) the adoption of the (Japanese) Kan-Ban system of inventory control; (c) greater collaboration in production design with vendors; (d) greater freedom to subsidiaries to make independent business decisions; (e) encouraging and assisting employees to set up their own companies for manufacture of parts/components, and (e) recasting a company's basic business activity and 'de-conglomerising' its structure.

The positive role of trade unions in small business dominated industries, e g, garments, construction, shoes, has contributed to increased efficiency and productivity, through organisation of training and R & D activities, as in Germany. Furthermore, area-oriented industry studies by local/municipal/state authorities and corporations have led to setting up of infrastructure for hi-tech industrial estates

and agglomerations of interrelated industries and services. Agglomerations in California and Massachusetts provide examples of the success of small enterprises, which do not thrive in isolation, but through obtaining external economies.

The fundamental purposes of the Small Business Administration (SBA), created in 1953, are to aid, counsel, assist, and protect the interests of small business; ensure that small business concerns receive a fair portion of government purchases, contracts, and subcontracts, as well as of the sales of government property; make loans to small business concerns, state and local development companies, and the victims of floods or other catastrophes, or of certain types of economic injury; and license, regulate, and make loans to small business investment companies. Its main activities are briefly outlined below:

—*Financial Assistance:* SBA provides guaranteed, direct, or immediate participation loans to small business concerns to help finance plant construction, conversion, or expansion; and acquire equipment, facilities, machinery, supplies, or materials. It also provides them with working capital. It makes direct loans to handicapped individuals and non-profit organisations employing the handicapped in the production of goods or services. Direct loans are also available to Vietnam and disabled veterans and to eligible contractors.

—*Disaster Assistance:* SBA lends money to help the victims of floods, riots, or other catastrophes, repair or replace most disaster-damaged property.

—*Investment:* SBA licenses, regulates, and provides financial assistance to small business investment companies, and minority enterprise small business investment companies. The sole function of these investment companies is to provide venture capital in the form of equity financing, long-term loan funds, and management services to small business concerns.

—*Surety Bonds:* Through its Surety Bond Guarantee Programme, helps to make the contract bonding process accessible to small and emerging contractors who find bonding unavailable.

—*Procurement Assistance:* SBA works closely with purchasing agencies of the federal government and with the nation's leading contractors in developing policies and procedures that will increase the number of contracts going to small business. SBA sets aside suitable government purchases for competitive award to small business concerns and provides an appeal procedure for a low-bidding small firm whose ability to perform a contract is questioned by the contracting officer. The administration develops subcontract opportunities for small businesses by maintaining close contact with prime contractors and referring qualified small firms to them. SBA maintains a computerised small business source referral system that provides qualified sources for federal government and large business procurements.

—*Business Initiatives, Education and Training:* SBA develops and co-sponsors courses and conferences, prepares informational leaflets and booklets, and encourages research into the operations of small business concerns, utilising the private sector to obtain maximum leverage.

—*Minority Small Business Development:* The programme is designed to promote business ownership by socially and economically disadvantaged persons. Participation is available to small businesses that are at least 51 per cent unconditionally owned, controlled, and managed by one or more individuals determined by SBA to be socially and economically disadvantaged. Programme participants receive a wide variety of services including management and technical assistance, loans, and federal contracts.

—*Advocacy:* The Office of Advocacy evaluates the impact on small businesses of legislative proposals and other public policy issues by preparing policy papers and by conducting research having an impact on small business. The office conducts economic and statistical research into matters affecting the competitive strength of small business.

—*Women's Business Ownership:* The Women's Business Ownership Programme, with a constituency of more than 4.5 million women business owners generating over $81 billion in gross receipts, was formed to implement a national policy to support women entrepreneurs. The office develops and co-ordinates a national programme to increase the strength, profitability, and viability of women-owned businesses while making maximum use of existing government and private sector resources. The Women's Business Ownership Act of 1988 provides $10 million for demonstration projects over a 3-year period and a guaranteed loan programme for loans not exceeding $50,000. It also established a National Women's Business Council, whose mission is to submit annual recommendations to the president and Congress on ways to improve opportunities for women-owned businesses, and to develop a long-range strategy for supporting such businesses.

—*Veterans Affairs:* The main objective of the Veterans Affairs programme is to advocate for assistance to veterans in business or those who wish to start business.

—*Innovation, Research and Technology:* The Office of Innovation, Research and Technology has authority and responsibility for co-ordinating and monitoring the government-wide activities of the Small Business Innovation Research Programme. In accordance with the Small Business Innovation Development Act of 1982, the office develops and issues policy directives for the general conduct of the programme. Information is supplied to each eligible and inter-

TABLE 7: EMPLOYMENT CHANGES BETWEEN 1975 AND 1986 BY SIZE OF ESTABLISHMENT MANUFACTURING INDUSTRY IN THE FEDERAL REPUBLIC OF GERMANY

ested small business concern on opportunities to compete for awards. The programme has four main objectives: to stimulate technology innovation, use small business concerns to meet federal research and development needs, encourage participation by minority and disadvantaged persons in technological innovation, and increase private-sector commercialisation of innovations derived from federal research and development.

—*International Trade*. The office of international trade develops new methods and techniques for assisting small businesses entering international markets, and plans, develops, and implements programmes to encourage small business participation in international trade.

—*Small Business Development Centres*. In accordance with the Small Business Development Centre Act of 1980, SBA establishes standards for the selection and performance of centres, develops alternative forms of centres involving state governmental bodies and private non-profit organisations, and implements new approaches to improve operations of existing centres.

Conclusion

US experience indicates that there is a great diversity in the form which dynamic, independent small business organisations can take. Business is shifting towards smaller production units both in search of lower labour costs and to implement new production techniques and organisational reforms. But small businesses do not thrive in isolation, they need large agglomerations and exogenous inputs of local/state governments, corporations, universities, hi-tech R and D institutions, consultancy firms, industrial estates, etc. Only in this milieu does entrepreneurship and venture capital financing fructify into successful small enterprises. Social networks in communication with each other and building interrelationships are necessary. US experience also provides examples of successful efforts to expand participation of minorities and women in small business. With the decline of manufacturing *vis-a-vis* services, small businesses could play a relatively more significant role.

Germany (West)

Germany has a long and strong craft tradition especially in the manufacturing field. This has made it possible for the country to take advantage of the change in demand away from mass produced goods towards customised goods in the 80s using microelectronic technology. The craft sector has expanded with the addition of decentralised units of large firms, and by taking advantage of flexible manufacturing systems through networking and striving for collective efficiency.

Heterogeneity rather than homogeneity characterises the small firm sector in Germany. While over the past 100 years an increase in the size of establishments has been observed, there has at the same time been a remarkable overall stability in the size of the small and medium sector. Very small establishments have declined dramatically, but existing firms have grown and new ones are constantly created. This has happened despite no special dispensations in favour of small firms, except the very small. Labour and social security regulations are equally applicable to all size categories above 20 employees. Legal provisions regarding payment of wages during illness, and dismissal of workers, are procedurally simplified for small firms. But only firms with up to five employees are exempt from the law on dismissal and from the obligation to establish a works council. There is no differentiation as regards taxation except that higher allowances mean virtual exemption for very small firms. The stability of small firms in the total economy is shown in Table 5.

If manufacturing alone is considered there has been a definite increase in share of small enterprises. The data in Table 6 exclude below 20 size category but include crafts. According to the Federal Statistical Office, there was a net increase in employment in establishments below 20 employees of 2.5 per cent between 1977-1980 and of 1.9 per cent between 1980-1984. No later figures are available.

Information on employment changes in manufacturing, by size categories, is available for the period 1975-1986. This is shown in Table 7. It may be seen that between 1975-1986 there has been a net increase in employment (as proportion of total employment) in the size categories <20, 20-49, 50-99 and 100-199, while there has been a decrease in categories 200-499, 500-999 and 1,000 or more.

There is no size definition as such in Germany. However, if the census data are considered by employment size, over 98 per cent of establishments/enterprises are in the category below 100 employees, which also accounts for more than 50 per cent of employment. In the manufacturing sector alone, however, over 70 per cent of enterprises but only 15 per cent of employment is accounted for by small enterprises. Craft firms constitute 31 per cent of the number and 42 per cent of employment in all small firms, while 77 per cent of the numbers and 54 per cent of employment are in small manufacturing.

Craft enterprises are typically small-scale, usually employing less than 20 workers. They predominate in metal (31 per cent), construction (30 per cent), services (14 per cent), food (12 per cent), wood (6 per cent) and textiles/leather (4 per cent).

Uniquely among developed countries, Germany has a special Chamber of Commerce for smaller or craft sector enterprises referred to in German as the Handwerk. All such craft sector enterprises must register locally with the Handwerkskammer (or Chamber of Crafts). The legal basis for the Handwerk organisation is a code developed in 1953.

The Handwerkskammer grew out of the guild system in Germany, whereby self-employed craftsmen from the same trade formed a 'Handwerk' or Craft Guild, which aimed to look after the interests of their

Table 8. Employment in Industries and Services for Marshallian Industrial Districts (DIM) and Italy, 1981

Total employment	906 009	16 883 286	5.4	1.00
Total population	2 435 211	56 335 678	4.3	
Employment rate (**)	37.2	30.0		

Notes: (*) The location quotient (LQ) is defined as $(E_{ij}/E_i)/(A_j/N)$ where E_{ij} = employment in industry i in area j
E_i = employment in industry i in nation
A_j = total employment in area j
N = total national employment
(**) Proportion of total population in employment.

Sources: The data have been calculated from: ISTAT, *6° Censimento General dell'Industria, del Commercio, dei Servizi e dell'Artigianato*, October 26, 1981. Cited in Giacomo Becattini, 'The Re-emergence of Small Enterprises', a chapter in a publication of the same title, International Institute of Labour Studies, Geneva, 1990.

members. At the national or federal level the associations for each state (land) form an occupation affiliate or national guild association. There were 65 such associations in 1980. All self-employed craftsmen and owners of handwerk related firms must be members of these chambers. The main task of these chambers as defined by the 'public law' is to represent the interests of the handwerk sector, to supervise training and to issue and control the regulations for the examination and certification of all 'craftsmen'.

The Central Association of German Handwerk (ZDH) is the headquarters organisation of the handwerk sector and has the role of presenting uniform policy recommendations and of representing interests of handwerk to the federal government of Germany The ZDH is powerful and one of the largest central organisations in the economy It is organised in departments, covering support network for (1) technical education and training, (2) insurance, (3) information, advice, consultancy and management education, (4) business promotion, (5) research, development and innovations and (6) finance and savings The education and training activities are among the most important of the Handwerkskammer since they are the basis for the education, examination and certification of craftsmen

Thus, the disadvantages arising from smallness in regard to access to capital, supplies and technology have from the beginning been countered through collective and co-operative action of a self-help nature initiated and encouraged by government The state's role has been in requiring compulsory membership of these organisations, and in the transfer of state functions to these self-governing organisations of the craft sector

The centralised system of collective bargaining in the country, the absence of significant differences in working conditions between large and small firms, the continuous enhancement of the competitiveness of the craft and small sector through co-operative and self-help measures, account for the stable share of the small sector in the economy Furthermore, the delayed industrial 'conquest' in Germany (mainly after the second world war) had provided sufficient time for the traditional craft and small sector to modernise itself, in terms of both production and management The inherent strength of the craft sector is due in no small measure to the development of the formal off-the-job vocational training system which is more suited to the skill requirements of small industry Finally, the craft sector itself has experienced restructuring, traditional lines like textiles declining, and metal, electrical, electronics, repair and personal services increasing considerably The trend towards smaller firms has been noted in plastics processing, foundries and metal working, steel and light steel construction, mechanical engineering, precision engineering, printing, food and luxury goods

There has, however, been increased penetration of small business markets by large firms through takeovers, acquisition of financial interest, splitting up of large firms and creation of rump companies to take advantage of provisions of tax and company law This has happened particularly in the textile, clothing and woodworking industries

The influence of large companies on the establishment and expansion of small firms, including craft enterprises, has been and is expected to continue to increase, for cost and tax reasons, as well as technology and management reasons A substantial increase in contracting out services as well as sub-assemblies and assemblies will develop necessitating data-processing links Subcontracting of innovation to small firms, financed by large independent venture capital companies, is likely to increase

The basic motivation governing state policy towards the small enterprise sector has been the contribution that the sector makes towards the creation of new jobs, in an economy undergoing structural change, rationalisation and fall in employment in the large-scale sector, and movement from the secondary to the tertiary sector due to technological and organisational reasons The following special measures have been taken by government in recent years

(1) An overall research and technology plan for small and medium firms has been implemented through federal grants for civil R and D, representing 25 to 30 per cent of total R and D grants

(2) Support measures to new companies through loans from the business set-up programmes (funded from Counterpart Funds of European Recovery Programme), amounting to DM 807 million in 1984, a five-fold increase over a decade The federal programme is supplemented by state and other programmes, so that about 37 per cent of new companies received assistance in a year

(3) Fiscal measures, such as reduction of trade tax, relief in property tax, special depreciation allowance of 10 per cent

(4) Policy of deregulation leading to exemptions and relaxations for small firms, on e g, employment contracts, protection against dismissals, social plan for workers, etc, enabling reduction or savings in cost of operation

With a view to influencing small firms, the trade union movement has in recent years established Technology Information Centres, to provide information on technical questions to works councils, shop stewards and employees

Conclusion

The legal basis of the craft sector, its continuous upgradation through its own organisations state assistance through loans, training institutions and R and D grants, and working conditions and productivity levels almost on par with large industry, are worthy of note It has to be recognised that the craft and small scale enterprises sector has to shift in response to structural change from traditional industries to those viable on flexible manufacturing systems, e g, engineering, design, parts and components, computer software, etc, as well as the growing services sector Germany is unique in the inherent strength of its individual enterprise in terms of quality productivity, innovativeness and competitiveness Inter-industry relationships are based on equality and one-to-one basis (between small and large) rather than on dependency

Italy

Italy has experienced rapid structural change in recent years. Between 1951 and 1981 the share of total employment declined from 48 per cent to 15 per cent in agriculture, but increased from 26 per cent to 34 per cent in industry and from 26 per cent to 50 per cent in services. The share of small enterprises increased considerably, in manufacturing from 50 per cent to 55 per cent of total employment, and in the total economy from 67 per cent to 72 per cent. (Small is here defined as enterprises with less than 500 employees.)

Italy provides the most successful example of the re-emergence of SSEs in the developed world through the application of flexible manufacturing (FM) systems in territorial concentrations of industrial districts where collective efficiency is obtained by modern electronic communications and increased computerisation, mainly directed towards export promotion. An important role in this achievement has been that of regional research institutes and of ENEA the national agency responsible for R & D and dissemination of information in the areas of energy, environment an technological innovation.

The remarkable Italian achievement has been through the establishment of industrial districts in the NEC region, (the North-East Central) or the third Italy. The social factors responsible were the disappearance of the sharecropping system of land tenure in the region, releasing a mass of workers ready to be employed in small firms and to acquire skills on the job. Furthermore, political and religious organisations created a system of socialising agencies, e g, National Artisans Federation, Association for Recreation and Culture, thus accentuating values of work and family ethics, group solidarity, etc.

The old industrial region of Italy is formed by the triangle of Milan, Turin and Genoa. The South or the Mezzogiorno has continued to remain less developed. The new wave of growth of the last 30 years or so has been in and around Bologna, Florence, Ancona and Venice. A vast network of small enterprises spread through villages and small cities has expanded rapidly. The products range from shoes, ceramics, textiles and garments on the one side, to motor cycles, agricultural equipment, automotive parts and machine tools on the other side. The average size of firms is small, often with 10 or less workers. However, agglomeration and centralised management enables them to achieve economies of scale and to respond quickly to changes in market demand. Data banks, information and communication system, joint purchase and marketing, capital and credit facilities, have all been made possible through the assistance of research institutes and consultant services. In the textiles, garments, leather products and machinery and components branches, export achievements have been possible through these industrial districts.

The transformation of the NEC region of Italy has not affected the traditional north which has remained a region of large mass production industries with its labour and cost problems. The traditionally poor south, where mafia culture remains an obstacle to entrepreneurial development, has not been affected. What has been developed in NEC region is a system of interrelated small enterprises centrally co-ordinated and deriving the economies of agglomeration, of scale and scope, external economies in the neoclassical Marshallian sense.

The explosion of demand for differentiated, personalised consumer goods on the one hand, and the development of flexible specialisation (in production systems) on the other hand, propelled the Italian experience. To quote Beccatini, "What determined the expansion of the Italian population of small firms was the co-operation of two factors: (a) a world-wide tendency towards the decentralisation and disintegration of the firm which was especially strong in Italy due to special circumstances in the labour market; (b) an explosion of small entrepreneurship, which was fostered by historical cultural inheritance, by a very stable local political environment that was not hostile to an industrialisation of lowly origin by a polycentric urban structure, and last but not least, by a habit of contacts and exchange with foreign countries."

Territorial, regional or area planning methods have been employed in identifying Marshallian industrial districts primarily to obtain external economies through localisation of industry. First, 955 Local Labour Market Areas (LLMA's) were defined through the functional regionalisation of journey-to-work flows connecting places of residence and of work. Thus, 955 LLMA's represent geographically and statistically comparable spatial entities and spatially-coherent systems of location. Second, the socio-economic structure of the local systems have been investigated in order to identify problems and factors (e g, the presence of entrepreneurs and workers in small firms, working wives, young workers, large households with elders, and the kind of amenities available). Thus, the 955 LLMA's have been categorised into 15 different groups of local systems according to their socio-economic characteristics. These local systems suitable for light industrialisation are considered as candidates for selection of Marshallian Industrial Districts (DIM), i e, having domestic manufacturing specialisation. A total of 61 Marshallian Industrial Districts have been identified, mainly localised in North-East and Central Italy, but also a few in North-Western Italy.

The Marshallian Industrial Districts account for 8.6 per cent of manufacturing employment of Italy, and 5.4 per cent of total employment. However, the proportion of total population in employment in the Marshallian industrial districts is 37.2 per cent, as against 30 per cent for Italy as a whole (Table 8).

The relative importance of the different categories of local systems and their shares in dominant manufacturing industries are shown in Table 9. While there are variations between industrial districts, typically it has 10,000 to 20,000 workers, in 1,000 to 3,000 firms with fewer than 20 employees each. The district is a cluster of firms interrelated to each other. There is both co-operation and competition. Co-operation occurs through commissioning and subcontracting, but also in functions such as bookkeeping, accounting, purchasing, marketing. In many districts, services are provided centrally through supply of information on equipment and markets, assistance in tendering for contracts, monitoring market changes, etc. The success of many districts has been due to the adoption of an institutional strategy involves co-operation of local and regional administration, unions, as-

sociations of small enterprises, co-operative leagues and universities.

Conclusion

The Italian success may be largely attributed to the advantages of collective agglomeration. The industrial districts have three broad characteristics: (a) the clustering and renewal of small firms specialising in different phases of a particular industry; (b) social structure characterised by a high level of small entrepreneurs, artisans, skilled workers, working wives and extended family or youth labour; and (c) proximity between home and work in the labour market. The common aspects of industrial districts are (a) extensive and elaborate co-operation on a flexible basis between small specialised firms; (b) flexible use of micro-processor-based technologies in combination with craft skills; (c) expansion of collective business services provided privately or by public agencies; (d) strong informal or institutional structures to ensure the provision of minimum pay scales and acceptable working conditions to regulate inter-firm co-operation and competition; (e) development of long-term collaborative relations with larger firms in or outside the area/region. Clustering of small firms in industrial districts, their use of flexible manufacturing systems, inter-firm co-operation and provision of services, enables them to derive the benefits of collective agglomeration, i e, external economies of scale and scope. The industrial districts in Italy provide a viable means for small enterprises to be competitive and successful in a globalising economy while the MNCs and mega firms also play a significant role. Territorial agglomerations, such as industrial districts, can provide viable links to the national and international economy in a country like India.

JAPAN

The outstanding characteristic of Japanese development is the leading role played by the state through long-term strategic planning, policy formulation, programme direction and facilitating implementation, by means of close co-operation of the Ministry of International Trade and Industry (MITI) with business and industry. While enterprises are owned and managed privately, the state plays the key role through monitoring the strategic plan and its targets, through assisting R and D implementation, through industry and trade policies, through wage-market policies, through provision of financing from the financial sector, etc. Over the last 35 years, material- and energy-intensive development has gradually given place to knowledge- and information-based development, through increasing use of electronics, computers and telecommunications. Japan is becoming the leader in moving further to environment friendly and earth friendly technologies.

Dualism in the economy, providing for mutually beneficial and inter-active co-existence of capital-intensive, high wage, highly productive large and heavy industries on the one hand, and labour-intensive, low wage, less productive SSEs on the other hand, has been a marked feature of Japanese development till very recently. Such a dualistic development was considered necessary to provide employment opportunities in small business for the rapidly decreasing farming population. Over the last 10 to 15 years, however, structural changes in the economy with the rapid growth in per capita income and the shift to the services sector, encouraged by developments in technology and management (computerisation, inter-linking, communications, decentralisation, flexible manufacturing system, etc.), are reported to have reduced the gap in productivity and wages between the large-scale sector and the small-scale sector. Differences which still exist reflect largely differences in productivity.

Small and medium-sized enterprises are defined under Japanese basic law separately for manufacturing and trade. In manufacturing, they include firms employing fewer than 300 persons and capitalised with less than 100 million yen. In retail trade and services, the limits are 50 employees and 10 million yen. For statistical purposes very small firms (VSFs) are those employing less than 30 and extremely small firms (EXSFs) are those having below 5 persons.

As regards manufacturing industry the data in Table 10 points to the relatively balanced structure of Japanese manufacturing industry as compared to other countries. However, there has been a decrease in employment provided by the manufacturing sector, which has affected large-sized categories more than the small-sized enterprises. Structural changes in the economy towards the services sector are responsible for this phenomenon.

The Japanese structure is the result of both economic and social factors. Cohesiveness, affiliation, education and training are some of the social factors. Economic factors are the close inter-industry relations (subcontracting), wage differentials, equitable access to capital and other inputs. Industrial subcontracting plays a crucial role in small-scale industry. Table 11 indicates that 50 per cent to 60 per cent of SSEs are sub-contractors and 70 per cent to 80 per cent of them are dependent on subcontracting for 80 per cent or more of their output. However, by 1981 independent subcontractors were 34.9 per cent and partially dependent 11.5 per cent, as against 54 per cent fully dependent subcontractors.

Structural changes in the Japar-se economy have meant that employment provided by manufacturing has declined while employment in the services sector has increased. For the manufacturing sector data available up to 1986 indicate that percentage share of employees increased in small enterprises and decreased in larger enterprises (Table 12).

Increasing per capita income and development of new technology are two factors which have influenced the expansion as well as improvement in efficiency of SSEs. The expansion of the domestic market arising from increased incomes provided opportunities to the extensive network of suppliers and subcontractors in the metal fabricating, machinery and transportation industries, and related trades and services. The

availability of a reservoir of trained labour enabled expansion of small labour-intensive business. As regards new technology (in micro-electronics and bio-chemistry) its very nature enabled enterprises to establish new businesses with relatively small amounts of capital. Consumer tastes also changed favouring differentiated products (from flexible manufacturing) rather than homogeneous mass-production goods. As regards subcontractors, labour shortages since the later 1970s, the development of flexible manufacturing methods, differentiated markets, demand for durable goods, etc, led to investment in machinery and equipment, precision tools, etc, and thereby to increased productivity and wages. The large increase in the number of independent subcontractors has resulted in more competition among suppliers as well as among contractors, and reduced the dependency-relationships. The appreciation of the yen in the 1980s forced measures for reduction in costs, thus encouraging more efficient subcontractors.

The Law to Promote Modernisation of SMEs (1968) designated 185 industries and trades as the target of modernisation; 72 of them are the object of emergency measures. Two special government banks provide loans to firms in the designated industries and trades in order to modernise production facilities and equipment The SME Financing Bank provides 10-year loans up to 350 million yen at below-market interest rates. The National Financing Bank provides low interest 10-year loans of up to 30 million yen per firm. Special loans are available for structural reforms for a group of firms.

The SME Undertaking, established in 1980, helps to develop land for groups of SMEs to integrate SMEs into co-operative unions, construct joint warehouses, modern shopping centres, etc. Such loans are provided jointly by the SME Undertaking and Prefactural Governments at low interest rates. Management expertise and consultancy services are also offered. The agency of SME's provides Prefectural Governments with financial aid to renovate local specialised industries.

Three kinds of institutions provide SMEs access to financial resources. There are (i) 69 mutual banks (law of 1951) for loans to SMEs up to a maximum of 15 billion yen, (ii) 561 credit banks (Law of 1951) giving similar loans to members of credit co-operatives, and (iii) 464 credit unions (1949 law) giving smaller loans of up to 400 million yen.

Furthermore, an association to guarantee credit for SMEs has been set up in each Prefecture. This is supported by Public Insurance Institution for SMEs (Chusho Kigyo Shinyo Hoken Koko). The SME Financing Bank and the National Financing Bank are government banks provided with regular source of funds (e g, postal savings and pension funds) for lending directly to small businesses. There is also the Central Bank for Commercial and Industrial Co-operatives for providing loans to member co-operatives.

SME Investment Promotion Companies have been established in Tokyo, Nagoya and Osaka, for providing equity capital, technical and managerial consultancy, in 28 industries or trades, for small enterprises with capital of less than 100 million yen. These three companies help preferably venture business firms which have unique technology or products and spend more than 3 per cent of sales revenue on R and D.

Tax exemptions (lower income tax rates) are also available to small businesses with capital less than 100 million yen, the tax varying with income.

To sum up, SSEs play a pivotal role in the Japanese economy, particularly in employment generation. In its plan for the 1990s, MITI underlines the need to activate SMEs, which it describes as 'the mother of creation'. Small companies must provide the requirements of 'fulfilling rich life styles'. While noting the relative decline in manufacturing *vis-a-vis* services, MITI emphasises the essential and leading role of manufacturing in technological innovation and plans to support the international activities of SMEs.

Conclusion

The Japanese success is due to several factors: high savings, highly cartelised society yet devoted to intensive market competition amongst the giants, long-term planning for structural changes and efficient allocation of resources in the economy. The lessons that may be derived for SSI development in developing countries are: (i) the importance of agricultural development and rural transformation in creating the demand conditions for SSI; (ii) the role and initiative of government in expansion of markets, in facilitating transfer of technology and other institutional arrangements for continuous adaptation, creativeness and progress; (iii) efficient allocation of resources through macro-policies; (iv) the role of large industry and of subcontracting, and (v) the role of a unique financial system.

China

Rapid industrialisation in the past two decades has transformed the structure of the Chinese economy. Between 1970 and 1990 the share of agriculture in GNP decreased from 40.4 per cent to 28.4 per cent, and of industry increased from 40.9 per cent to 44.3 per cent (47 per cent in 1988). During the same period, the labour force in industry increased from 10.2 per cent to 21.4 per cent, and decreased in agriculture from 80.8 per cent to 60 per cent. Chinese share of world industrial output more than doubled between 1977 and 1986, the country ranking seventh in World MVA. The state-owned sector still accounts for the largest share of gross industrial output (54.5 per cent in 1990). However, ownership by the state had declined during 1985-1990 from 64.8 per cent to 54.5 per cent.

Table 13 shows the distribution of gross and net value of output in 1990 amongst (1) state-owned, collective and other enterprises; (2) light industry and heavy industry; (3) large-scale, medium-scale and small-scale industries.

The classification into large, medium and small categories is determined separately for different products on the basis of production capacity. Where the products are not homogeneous or a variety of products is

manufactured the criterion of book value of fixed assets is used. No further details are available.

Township enterprises include:

(1) Enterprises previously run by communes and production brigades;

(2) Co-operative enterprises run by rural labourers;

(3) Individual-run enterprises and enterprises of other ownership at or below the township level.

China's development strategy since the early 60s has not only given equitable importance to agriculture and industry, but also emphasised the role of SSI. Rural non-agricultural development has become a key component of China's development strategy. Chinese policy is to transform its agriculture from 'self-sufficient and semi self-sufficient' production to 'large-scale commodity production'. This involves increase in farm size and a substantial share of agricultural population moving out of cultivation. Specialisation of households in crop production, forestry, fishery, livestock and sideline production (handicrafts, commercial, food and beverages, services, repair, transport, house renovation) is encouraged. Private undertakings in these lines are helped by local governments with credit, tax concession, technical assistance and favourable prices. Besides individuals, community and brigade enterprises (CBEs), hitherto owned collectively by members of a commune or brigade, are being encouraged since 1984 under different forms of ownership arrangements viz, joint ownership by individual households or ownership by several brigades or communes, equity and dividend being distributed according to capital contributed. Communes are now in townships and brigades in villages. The term CBEs has been replaced by respectively township-town enterprises and township-village enterprises (TVEs). Peasants involved in commerce, services or industry could establish household registration in market towns, while continuing to be responsible for their own grain (food) requirements. This is part of a general policy to revive market towns, regarded as essential for agricultural commercialisation and non-agricultural rural development. Market towns provide the sites for most TVEs, they are the centres for rural-urban trade and provide essential services to agriculture. The 53,000 market towns existing in China are not classified as urban areas—they are being developed as alternatives to urban cities, with provision of social infrastructure. It is projected that by the year 2000 the share of the rural labour force in non-agricultural activities should increase (from 11 per cent in 1982) to 44 per cent.

The ideological foundations of the rural economy of China changed from central planning and large agricultural collective farms to market mechanism and independent farms and firms. The rapid growth of rural industrial and other non-agricultural activities has been accompanied by significant increases in rural personal incomes and major shifts in the structure of the labour force. Fresh employment opportunities in non-agricultural activities absorbed over 30 million persons during 1978-1986. For the same period, gross value of rural industrial output grew by 23 per cent per annum in real terms. Among rural enterprises, the township- and village-owned enterprises and farmers' joint-stock enterprises have a dominant position.

The emergence of millions of rural firms in the last decade contributed a new force in reshaping the structure of the Chinese rural economy. New activities and technologies have become operative along with the emergence of a large number of entrepreneurs, managers, technicians and skilled labour force. Rural industry has been the most rapidly growing segment of Chinese industry and became an integral component of the rural economy in the 1980s.

Technological constraints have been gradually eliminated through a process of choosing and adapting technology appropriate to local conditions. The 'Spark Plan' aimed at the gradual transformation of traditional agriculture, poultry farming, forestry and fruit growing has promoted a number of local resource-based key industry. The plan has injected new technologies into the production process of rural enterprises and focused attention on preventing pollution. Between 1986 and 1989, of the 20,000 projects launched under the 'Spark Plan', 10,346 projects have been completed. The increased output was valued at Rmb 22.18 billion, net of Rmb 5.53 billion in profits and taxes. Exports from these projects fetched around $740 million in 1989, equivalent to 45 per cent of the total export volume of township enterprises in the preceding three years.

Conclusion

The development strategy has focused successfully on massive rural transformation through area planning, rural infrastructure investment, technology upgrading, commercialisation of agricultural production, stimulation of rural non-farm activities, setting up town-village enterprises in nodal towns and moving away from total state ownership and control to individual, group and co-operative ownership and management. The intensive and large-scale operation of the 'Spark Plan' since the mid-80s contributed significantly to growth in incomes.

South Korea

South Korea has emulated Japan in vigorously pursuing policies of export-led industrialisation. However, unlike Japan (and Taiwan) the small-scale sector did not play a significant role, although its share in manufacturing has begun to increase in the 80s. As compared to Japan and Taiwan, income distribution has been more concentrated, rural transformation less intensive and export dependence much greater in Korea. The share of exports in Korea's GDP rose steadily to almost 50 per cent in 1988, before falling back to one-third, as the source of growth shifted somewhat towards domestic demand. Imports accounted for over 40 per cent of GDP in 1990, an increase from

Table 14: Percentage Shares of Different Size Classes of Manufacturing Establishments in Aggregate Manufacturing by Number of Establishments, Employment and Value Added, 1963-1987

Sources: Economic Planning Board, Report on Mining and Manufacturing Census for census years 1963, 1968, 1973, 1978 and 1983 and Report on Mining and Manufacturing Survey for 1966, 1970, 1976, 1982, 1986 and 1987. As cited in Jeffrey B Nugent, 'Variations in the Size Distribution of Korean Manufacturing Establishments Across Sectors and Over Time', Korean Development Institute, Working Paper No 8932, August 1989.

10 per cent in the early 1960s Export growth has been highly import dependent, for capital goods, raw materials and components Liberalisation has led to specialisation in higher value added products with a substantial import content As regards rural transformation, it followed the first phase of industrialisation and did not precede it, unlike in Japan and Taiwan In South Korea there is a heavy concentration of large and small establishments in and around the largest cities

For a decade up to the mid-60s import substitution policies were followed leading to rapid growth of consumer goods and intermediate goods The outward-looking policies followed thereafter included more realistic foreign exchange rates, liberalised import controls and export incentives (tax reduction and exemptions, improved access to credit and imported inputs) The export-induced industrial growth has been extremely successful in creating employment, since manufactured output (for exports) has been increasingly labour-intensive Larger markets increased the importance and advantage of large plant size and some SSEs may have expanded to larger sizes Unlike Japan, subcontracting and division of labour between small and large enterprises is infrequent The degree of vertical integration is high, large companies carrying out most of the operations within the plants However, international subcontracting by large and medium companies catering to Japanese and US multinationals took place

As stated in the beginning, the increasing dominance of large industry seems to have been reduced in the 80s Table 14 indicates that employment in small firms (5-19 workers) after falling from 29 per cent in 1963 to 7 5 per cent in 1978, increased to 10 per cent in 1987 The share of medium enterprises (20-199 workers) increased much more while the share of large enterprises (200 + workers) decreased But the value added in SME has increased less remarkably Even in 1987 more than two-thirds of value added came from large enterprises However, the share of the largest enterprises (500 + workers) decreased over the period 1976-86 from 45 1 per cent to 35 per cent in employment and from 58 1 per cent to 52.4 per cent in value added

Over the period of industrialisation the share of heavy and chemical industries has continuously increased from 40 per cent in 1963 to 54 per cent in 1986 in total employment and from 35 per cent in 1963 to 62 per cent in 1986 in total value added by manufacturing Steel, electrical machinery and transport equipment have conspicuously increased, while textiles, beverages and tobacco have conspicuously decreased The percentage share of large enterprises (200 + workers) in manufacturing employment and value added has expanded considerably over the period 1963-86 for each of the 30 industries However, decrease in some industries are perceptible in the 80s These are in textiles, weaving apparel, leather and footwear, wood, printing, plastics, clay products, metal products and scientific instruments

The definition of small and medium enterprises in Korea is based on the SMI Act of 1979 Those enterprises in manufacturing, mining and transportation which have 20 full-time employees or less are defined as small, while those with less than 300 (less than 200 prior to 1979) but more than 20 full-time employees are medium However, the limit for medium enterprises could be extended up to 700 employees, provided a total assets criterion ranging from W5 to W8 million for different branches of industry was met

In 1989, the Ministry of Trade and Industry formulated a 10-year Promotion Plan for SMEs, the goal being to increase the share of SMEs in 1991 to 54 3 per cent of employment and 44 8 per cent of value added The Plan contained a package of measures including a product reservation scheme ('designated areas'), credit allocation from banks, a loan guarantee programme, a special bank for SMEs, a subcontracting programme, a technical extension service programme, preferences in government procurement and setting up a special trading company for assisting SME exports

The 'designated areas' or product reservation programme is regarded as a negative measure Details are not available, but it seems to be indirectly implemented through the registration procedure of the Ministry of Trade and Industry There is a negative or prohibited or restricted list of industries (e g, ginseng, tobacco, flour milling) for foreign investment. Large enterprises are not permitted to expand in items, e g, leather, shoes, toys, etc In any case product reservation makes little sense in a country like South Korea where the SMI definition is so wide.

Regarding financial assistance, a credit guarantee scheme has been developed. Commercial banks have to lend a certain proportion of their funds to SME, and a separate bank, the Small and Medium Industry Bank, operates as a public sector bank Interest rates are lower for SMI (9 per cent as against 11 5 per cent for large enterprises in 1985) The Small and Medium Industry Bank provides loans—through the Small and Medium Industry Investment Corporation (SMIPC)—of up to W300 million, covering 6-90 per cent of the project cost for a modernisation programme for a small and medium enterprise

Financial assistance is also made available to help SMEs train their technicians in domestic or overseas centres Support for R and D and extension services are provided, and formation of research co-operatives to undertake R and D encouraged Risk capital and financing of R and D are provided by the Korea Technology Financing Corporation (a private institution) and by the Korea Development Investment Corporation (a subsidiary of Korea Development Bank) Such financing is available for 10 years (plus 3 years grace period) for 100 per cent of amount required (70 per cent in local currency)

The Small and Medium Industry Promotion Corporation (SMIPC) established in 1979, has the following functions

—Promotion of co-operatives of manufactures of similar products in order to centralise purchasing, marketing or capital-intensive operations

—Provision of extension and information services

—Management training through the Institute for Small- and Medium-scale Enterprise Training

—Liaison with the Korean Federation of Small Businessmen

—Operation of offices abroad dealing with

market prospecting and technological information.

—Granting credit for the hire purchase of equipment.

—Operation of a modernisation programme, consisting of technical, training and financial assistance for small- and medium-scale industrial enterprises wishing to modernise their structure and production (in a fairly long list of priority branches of industry).

1,000 to 1,500 enterprises are assisted every year with technical and management advice by SMICP. There is increasing emphasis on technological and management innovation in order to increase productivity and competitiveness. More than 60 per cent of all assistance goes to machinery, metal, electrical and electronics industries.

The Korean Institute of Economics and Technology (KIET), established in 1981, collects, processes and supplies to business (especially SME), information on trade, technology and industry. KIET maintains satellite-connections with data systems abroad, has built a library as well as its own data base.

The Korean Federation of Small Business (KFSB) is a very active organisation with over 16,000 members. Its activities involve the co-ordination of subcontracting, collective purchasing and selling, establishing contact with overseas buyers and investors, information services, technology transfer and policy recommendations to the government. KFSB has a Systematisation Promotion Council which assists the Ministry of Trade and Industry (MTI)'s industrial systematisation programme. The project involves stimulating the production of parts and components in about 1,000 SMI companies, and integrating parts production with prime manufacturing by large enterprises. The project is related to import replacement in automobiles, electronics, machinery and building industries. Tax privileges, e g, exemptions from import duty on equipment are made available. The KFSB regularly examines business transactions and assists in resolving disputes between large firms and their suppliers.

The role of SMI has been receiving continuing attention in recent years. The government of Korea announced the following programme in 1992 to enhance the productivity and international competitiveness of small and medium manufactures.

—To make more funds available through capital increase of the Industrial Bank of Korea and activation of the over-the-counter (OTC) stock market as part of measures to expand funds to SMI which is likely to face a credit squeeze in the wake of interest rate liberalisation.

—To establish task force within the Korea Federation of Small Business to deal with possible inroads that SMI face due to import liberalisation.

—To accentuate technological development, the government will bolster technical guidance, activate the provincial industrial research centres and develop an information distribution system for SMI.

—Various laws related to SMI will be streamlined so that the government can push ahead with the readjustment project for this sector.

—Assistance will be given to SMEs which are developing world class top quality goods. Effective assistance to promising SMEs will be made.

Conclusion

Korean experience exemplifies the success of an approach combining appropriate macro policy measures, creation and maintenance of suitable environmental conditions, continuous upgrading of skills and technology, operation of viable financing systems, and direct government intervention through public sector institutions. With emphasis on optimising factor use and on total factor productivity, specific attention to assist and promote small enterprises came later in the development process, yet perhaps in time to take advantage of the transition (in developed countries) from a mass production system towards flexible manufacturing. While keeping in mind the skewer distributional effects of these policies in the 60s and 70s, Korean experience indicates that efficiency is related to technology absorption and diffusion and upgrading of skills, and that a range of sizes are suited to different product and market characteristics.

MALAYSIA

Since early 70s Malaysia has pursued a long-term strategy under the New Economic Policy for the period 1970-1990 and the Industrial Master Plan for the period 1986-1995, with the twin objectives of eradicating poverty and restructuring Malaysian society. It was felt by the end of the 70s that growth strategies—largely export-led—rather than redistribution measures would contribute more to increase in incomes and poverty eradication. The 80s witnessed a movement away from inward to outward orientation. The Industrial Master Plan (1986-95) is contributing a great deal to a pragmatic orientation.

The policies for industrial development focus on:

(i) widening the range of manufactured products for exports;

(ii) strengthening the industrial base, moving away from mere assembly type processes to more in-depth manufacturing, processing, producing components and parts locally;

(iii) encouraging both vertical and horizontal inter-firm relationships in order to increase value added in manufactured exports;

(iv) enhancing the participation of small and medium enterprises in mainstream industrial activities by developing ancillaries capable of supplying quality components and parts to large enterprises;

(v) creating a congenial environment for private sector investment and R and D activities; and

(vi) developing technically competent personnel.

The GDP of Malaysia grew at a rate of 5.4 per cent per annum during 1979-86. Since 1988 it has grown at 8 per cent to 9 per cent. The growth of manufacturing was 6.7 per cent during 1979-86, 13.4 per cent in 1987, 17.6 per cent in 1988, 12.0 per cent in 1989 and 11.0 per cent in 1990. The share of manufacturing in GDP increased from 13.9 per cent in 1970 to 25.8 per cent in 1990. Manufacturing employment has increased at an average rate of 6.7 per cent over the last 25 years accounting for over 13 per cent of the total employed in mid-80s as against 6.5 per cent in the late 1950s. Being a resource-rich country with a favourable land-man ratio, Malaysia does not suffer from population pressure.

The SSI sector is relatively under-developed in Malaysia. The policy has been directed towards development and employment of Bumiputras (Malays) rather than of small-scale manufacturing enterprises as such. Bumiputra employment has increased in trade and services and in agriculture, rather than in manufacturing. Outward orientation has encouraged skill-intensive and relatively capital-intensive middle-sized enterprises, which are efficient, productive and competitive. Account has also to be taken of relatively higher wages in the country. The programmes for industrial estates, industrial incentives (except financing of Bumiputras) and extension services have been available for all sizes of enterprise and not specifically oriented towards SSI. Changes in the size structure of manufacturing firms

TABLE 16. SHARE OF ENTERPRISE SIZES IN MEXICAN MANUFACTURING ESTABLISHMENTS, EMPLOYMENT AND INCOME IN 1990

(Per cent)

	Establishments	Employment	Income (value added)
Micro	77 2	11 3	7 2
Small	17 8	23 6	19.2
Medium	2.9	16.0	15 1
Large	2.1	49.1	58.5
Total	100 0	100 0	100.0

since mid-70s are analysed in Table 15.

The declining share of SSI and the increasing shares of large- and medium-scale industry are obvious from the date in the table. Large-scale industry accounts for more than half of employment, over 60 per cent of value added and over 65 per cent of fixed assets, in the total. It is also twice as productive as small-scale industry.

One reason for relatively slower growth of SSI is the lack of backward linkages with large industries, which are mainly engaged in exports and have their relationships with firms in developed countries. SSI produce mostly finished goods, e g, foodstuffs, furniture, handicrafts, fabricated metal products, wood-based products and textiles. The medium-sized industries are involved in beverages, electrical and electronic products, chemicals, non-metallic minerals and automobile components.

There appears to be scope for development of SSI to supply castings, components, parts and services to LSI. Most of the foundry and engineering, machinery and medium-tool industries have remained small and need modernisation and diversification. The Industrial Master Plan (IMP) recognises their needs and recommends the preparation of specific programmes. The Malaysian Subcontracting Exchange Programmes (SCS) was initiated in 1986 in response to the recommendations of the IMP on inter-industry linkages and the promotion of ancillary industries. The SCX activities are closely co-ordinated with those of other related agencies.

The inadequacy of SMI providing support services and inter-industry linkages, and the likely shortages of engineers and managers, are constraints in the industrialisation of Malaysia.

SSEs are defined as those with capital investment below M$ 250,000 and having less than 25 employees. Like large enterprises SSEs enjoy reduced location tax, pioneer status, etc. They are exempted from paying sales tax if the value of turnover is less than M$ 100,000 per annum or payroll expenditure is less than M$ 20,000. They are also exempted from import duties on imported machinery and raw materials.

Assistance to SSI is now provided in an integrated manner as follows:

—Financial assistance: Funds are earmarked from the financial system under government guidelines for the use of SMI. In 1988 M$ 300 million was allocated from commercial banks. An Enterprise Rehabilitation Fund (ERF) of M$ 500 million has also been set up to encourage the banks to extend assistance to ailing Bumiputra enterprises. Commercial Banks are required to lend at least 20 per cent of the total loans outstanding to Pumimutra and for food production. Commercial banks must deploy 50 per cent of the total for small, unsecured loans under a Special Loan Scheme, backed by credit guarantees, which provides up to a maximum of M$ 50,000 at a subsidised interest rate of 7.5 per cent.

—Project development: Assistance takes the form of feasibility studies, entrepreneurial development, market promotion and provision of industries sites.

—Training: Areas covered include courses in management, accounting, salesmanship, marketing, and also advisory services on business practices and the dissemination of business management information.

The main institutions involved in SSE development are:

—Small-scale Enterprise Division (SED), Ministry of Trade and Industry: Set up in 1981, it is responsible for the promotion of SSEs in line with national economic policy. SED identifies investment opportunities, provides incentives, advice and information to small entrepreneurs and fosters interest in SSI. SED is also responsible for the co-ordination of activities of various agencies.

—Malaysian Development Bank (BPMB): The Bank, which is supported by the government, provides credit and other assistance to small Bumiputra entrepreneurs (e g, for buying stocks).

—Credit Guarantee Corporation (CGC): CGC provides backing to commercial banks which supply credit to small firms, for viable projects for which adjacent collateral is not available.

Other agencies providing support to SSI include Malaysian Entrepreneurship Development Centre, Malaysian Industrial Development Authority (MIDA), Malaysian Industrial Development Finance Company (MIDF), National Productivity Centre (NPC) and Standards and Industrial Research Institute of Malaysia (SIRIM).

A unique scheme combining provision of venture capital with a continuing training programme has been launched on a commercial basis in 1992 to speed up development of Bumiputra enterprises. Perbadanan Usahawan Nasional Berhad (PUNB) or Entrepreneur Development Corporation has been set up as a company wholly owned by the Foundation for Bumiputra Investment. With an authorised capital of M$ 200 million, the objective is to help establish viable Bumiputra enterprises. Companies with equity of M$ 250,000 to M$ 10 million are eligible for assistance. The company could finance up to 80 per cent of project cost as equity loan for a period of 3 to 10 years. The loan is dependent on implementation of a structured training programme and institution of a management and administration system. Holdings by the company will be sold to shareholders at the end of the loan period upon completion of training and operation of the enterprise on a viable basis. Joint ventures between Bumiputras and non-Bumiputras are possible.

Conclusion

Malaysia is a special case of a developing country relatively rich in natural resources and with a favourable land-man ratio. Its special programme for increasing the participation in the economy of the indigenous Malays (Bumiputras) may provide lessons for other countries with backward or disadvantaged groups.

Mexico

Mexico provides a successful example in Latin America of the resurgence of SMI in the 80s. Even in a period of import compression to overcome the debt problem, when large industries languished and there was some

Table 17: SMI Share in Manufacturing Output and the Domestic Input Coefficients
